On the other hand, they acknowledged and supported their succession. As a separate party with clear cut views on these matters, they emerged in 'Ali's reign during the battles of the Camel, Siffin, and Nahrawan. Later, the cold-blooded slaughter of Hussain rallied them, fired them with a new wrath, and shaped their views into a separate creed. The indignation provoked among the general Muslim populace by the vile deeds of the Umayyads and the sympathy excited in their breasts for the descendants of 'Ali on account of their constant persecution in both the Umayyad and the 'Abbasid regimes, lent extra-ordinary support to Shi'ite propaganda. They had their stronghold at Kufah. Their beliefs were as follows:

1. The Imam's office (particular Shi'ite term for the Caliph's office) is not a public office the institution of which may have been left to the choice of the public (ummah). The Imam is a pillar of the faith and the foundation stone of Islam. Therefore, it is one of the main duties of the Prophet to institute somebody as Imam instead of leaving the matter to the discretion of the community.⁴⁰

2. The Imam is impeccable, i.e. free from all sins, great and small. He is immune from error. Everything that he says or does is inviolate.⁴¹

3. The Prophet had conferred the Imamate on 'Ali and nominated him as his successor. Thus 'Ali was the first imam by ordinance.⁴²

4. As the appointment of the imam is not left to be made by public choice, every new imam will be appointed by an ordinance from his predecessor.⁴³

5. All the Shi'ah sects are also agreed that the Imam's office is the exclusive right of the descendants of 'Ali.⁴⁴

Beyond this general agreement, however, the various Shi'ahs sects differed among themselves. The moderate among them held that 'Ali was the best created man. He who fought or bore malice against him was an enemy of God to be raised among infidels and hypocrites and destined to live in hell. "If 'Ali had refused to recognize their Caliphate as legitimate and expressed displeasure with them, Abu Bakr, 'Umar and 'Uthman who preceded him as Caliphs would also have deserved that doom, but as 'Ali recognized them and swore allegiance and offered prayers behind them, we cannot take exception to what he took as right. We do not differentiate between 'Ali and the Prophet except that the latter was endowed with prophethood, for the rest 'Ali was worthy of the same esteem as the Prophet.⁴⁵

The fanatical among them held that the Caliphs before 'Ali were usurpers and those who elected them were ill-guided and unjust, as they belied the

Prophet's will and deprived the rightful caliph of his due. Some went further and pronounced anathema against the first three Caliphs and declared them and their electors ex-communicated.

The softest of them were the Zaidiyyah, followers of Zaid (d. 122/740) son of 'Ali, son of Hussain. They regarded 'Ali as superior to others, but allowed the choice of those who were inferior to him. Moreover, they held that the Prophet's decision in favour of 'Ali was not unequivocal; hence, they accepted the Caliphate of Abu Bakr and 'Umar. All the same, they preferred the choice of an able person from the descendants of Fatima (the Prophet's daughter) as imam, provided he claimed that position and challenged the title of "the kings" to it.⁴⁶ Abu Hanifah was closely connected with Zaid, as we shall see in the course of this chapter, although he did not contribute to the Zaidite doctrine.

The Khawarij

In direct opposition to the Shi'ahs the Khawarij stood at the other extreme. They suddenly grouped together during the battle of Siffin. Until then they were among the staunch supporters of 'Ali, but when, during that engagement, he consented to submit his quarrel with Mu'awiya to the decision of two arbiters, they abandoned him asserting that he had turned infidel by accepting to submit to the verdict of human arbiters instead of God. After that they drifted farther and farther away and being fanatical hot heads, who believed in waging war against those who differed from them and against "unjust government" wherever one was found, they indulged in war and bloodshed for a long time until their power was finally crushed under the 'Abbasid rule. They, too, were most influential in Iraq, their camps being mainly centred in al-Bata'ia between Kufa and Basra. Their beliefs briefly were as follows.

1. They acknowledged Abu Bakr and 'Umar as Rightful Caliphs but 'Uthman, in their opinion, had, towards the end of his reign, erred from the path of justice and right conduct and hence deserved to be deposed or killed. 'Ali also committed, according to them, a major sin when he accepted the "arbitration" of "one besides God." The two arbiters ('Amr bin 'As and Abu Musa al-Ash'ari), their choosers ('Ali and Mu'awiya), and all those who agreed to arbitration were sinners. All those who participated in the battle of the Camel, including Talhah, Zubair, and A'ishah, the Prophet's wife, had been guilty of grievous sin.

2. Sin, with the Khawarij, was synonymous with infidelity. Anyone who committed a major sin (and did not repent and revert) was placed outside the pale of Islam. All the personages mentioned above were declared infidels. Anathema was pronounced against them, and they were considered fit to be censured. The Muslims in general were pronounced infidels, first, because they were not free from sins, and, secondly, because they not only regarded these persons as Muslims but also acknowledged them as reliable guides, and deduced and verified the law from traditions reported by them.

3. The Caliph, according to them, should be elected by the free vote of the Muslims.

4. The Caliph need not be a member of the tribe of Quraish. Whomsoever they elected from amongst the honest Muslims would be a rightful caliph.

5. A caliph was to be obeyed faithfully as long as he acted rightly and justly, but if forsook the path of right and justice; if he was to be fought against and deposed or assassinated.

6. The Qur'an was recognized as the authoritative source of law but their views on Hadith (the Prophet's Tradition) and ijma' (the agreement of Muslims in respect of a rule of Law) were different from those of the majority.

A large group of them, which called itself al-Najdiyyah, did not believe in the very need of a State. The Muslims, they said, should of themselves abide by the right. However, if they needed a Caliph to direct their affairs, there was no harm in choosing one.

Their major section, the Azariqah, dubbed all Muslims, expecting themselves polytheists. The Khawarij, according to them, could not go for prayer in response to any but a Kharijite's call. They could neither take the meat of an animal slaughtered by non-Kharijites, nor marry among them, nor could a Kharijite and a non-Kharijites inherit each other's possessions. They considered war on all other Muslims to be a religious duty and sanctioned the killing of their women and children and the looting of their property. They declared those of their own sect as infidels if they shirked this duty. They allowed treachery with their opponents and were so malicious that a non-Muslim would find himself safer in their midst than an average Muslim.

The most tolerant of them were the Ibadyyah who refrained from declaring the other Muslims as polytheists although they put them outside the pale of Islam and described them as non-believers. Their evidence, the Ibadyyah said, was to be accepted, marriages with them and inheritance to and from them allowed. Their territory, too, was not to be called dar al-kufr (the land of the infidels) or dar al-harb (the land of the people at war) but dar al-tawhid (the land of the people of one God) although they excepted the centres of their government from it. They disallowed secret assaults on other Muslims, although open warfare with them was not repugnant.⁴⁷

The Murji'ah

The conflicting principles of the Shi'ahs and the Khawarij were responsible for the birth of another sect, called the Murji'ah.

Apart from the people who had flung themselves violently in support of 'Ali or against him during his wars, there was a section which had remained neutral either wisely avoiding to indulge in war, which they had deemed a curse to being unable to decide which side fought for the truth. These people quite realized that it was a veritable curse for Muslims to indulge in bloodshed and mutual slaughter, but they were not prepared to blaspheme any of the belligerents, and left it to God to decide the affair between them. He alone would tell, on Judgment Day, which of them struggled for the right cause and in general, but when the Shi'ahs and the Khawarij raised questions as to what was faith and what constituted infidelity ushering in an era of doctrinal wrangling and polemical contests, this neutral group

evolved some theological doctrines in support of its position. Briefly stated, they were as follows:

1. Faith comprises belief in God and the Prophet. One's action does not form an integral part of one's faith. Hence, a believer will remain a believer though he should eschew his duties or commit grave sins.

2. Salvation depends on faith alone. No sin will hurt one who has faith. It is enough for a man's redemption that he should abstain from polytheism and die as a monotheist.⁴⁸

Some of the Murji'ah, taking it a step further, affirmed that short of polytheism, all sins, even the worst, would be forgiven.⁴⁹ A few, taking a further leap in that direction, asserted that if a man cherished faith in his heart but worshipped idols or adopted Jewish or Christian doctrine and spoke heresy in the Islamic State where he lived under no fear, he would yet be quite fast grounded in faith, remain a friend of God, and deserve to go to Paradise.⁵⁰

Another view closely comparable with the one mentioned above was that if one's duty to uphold the right and stem the wrong (amr bi alp-ma'ruf and nahi 'an al-munkar) required one to bear arms, it was a "trial" to be avoided. It was quite right to check others on wrong conduct, but to speak loud against the tyranny of government was not allowed.⁵¹ Al-Jassas was very bitter on these things and asserted that they strengthen the hands of tyrants and greatly demoralized the Muslims' power of resistance against the forces of evil and wickedness.

The Mu'tazilah

This tumultuous period was responsible for the birth of yet another sect known to Islamic history as "the Seceders." Although it did not owe its origin, like the former three, to purely political factors, like them it contributed its share of opinions to the political issues of the day and entered the arena of theological disputes that raged in the Islamic world at that time, particularly in Iraq. The leaders of this group, Wasil bin 'Ata (80 - 131/699 - 748) and 'Amr bin 'Ubaid (d. 145/763) were both contemporaries of Abu Hanifah, and Basra was the centre of their religious contests in the beginning.

Their political views were briefly these:

1. The appointment of an Imam (or, in other words, the institution of the State) was a religious urgency. Some Mu'tazilites, however, opined that the Imam's was a superfluous office. No Imam was needed if the community followed the right path.⁵²

2. The choice of the Imam, according to them, rested with the community, and only the community's choice validated his appointment.⁵³ Some of them held that the choice should be unanimous, and in the event of differences and dissensions the appointment should be suspended and held in abeyance.⁵⁴

3. The community could choose any morally qualified and efficient person as Imam. The condition of his being a Quraishite, an Arab, or a non-Arab was irrelevant.⁵⁵ Some of them actually preferred the appointment of a non-Arab, it was better still if he could be a freed slave, for he would have fewer devotees, and it would be easy to depose him if he turned out to be a

tyrant.⁵⁶ They would rather have a government which was weak and easy to depose than one that was bad but strong and firmly established.

4. According to them, the Friday or other congregational prayers could not be held behind an unrighteous Imam.⁵⁷

5. Amr bi al-ma'ruj w-al-nahi (enjoining what is right and forbidding what is wrong) was among their fundamental principles., It was a duty with them to rise in arms against an unjust government provided they had the power to do so and hoped to raise a successful coup.⁵⁸ Thus it was that they rose in arms against the Umayyad Caliph Walid bin Yazid (r. 125 - 126/743 - 744) and tried to replace him by Yazid bin Walid who espoused their doctrine of succession.⁵⁹

6. On the question of the inter-relation of sin and infidelity, over which the Khawarij and Murji'ah were at logger-heads, their verdict was compromising. A sinful Muslim was neither a believer nor a disbeliever, but one in the middle state.⁶⁰

In addition to these principles, the Mu'tazilah pronounced bold verdicts upon the differences among the Prophet's Companions and upon the issue of caliphate. Wasil bin 'Ata declared that one of the two opponents in the battles of Camel and Siffin was surely a "transgressor" although it was hard to say who. It was for this reason that he said that if 'Ali Talhah and Zubair came before him to give evidence on a vegetable knot, he would not accept it of them since there was a possibility that they had been guilty of transgression. 'Amr bin 'Ubaid pronounced both sides as "transgressors."⁶¹

They also attacked 'Uthman vigorously and some of them did not spare even 'Umar.⁶² Besides this, many of them practically rejected the Hadith (the Prophet's Tradition) and ijma' (the consensus of opinion) as authoritative sources of Islamic Law.⁶³

The Major Section

In the midst of these violent, wrangling groups the large majority of Muslims went along subscribing to the orthodox principles and doctrines, accredited as authoritative since the days of the "Right-guided" Caliphs, principles and precepts which the Prophet's Companions and their successors and Muslims in general had commonly regarded as Islamic. However, nobody, from the time of the inception of the schism down to the days of Abu Hanifah, had vindicated the stand of the majority in these matters of violent divergences, and presented it methodically in a compact, doctrinal form, although learned men, traditionists and scholars of repute and integrity had from time to time been bringing one or another aspect of it to light by word of mouth or action, or embodying it in their behaviour or sacred pronouncements as opportunity afforded itself.

Notes

1. Qur'an, 4: 59, 105, 5:44, 45, 47, 7:3, 12: 40, 14: 55, 23: 36.

2. Tradition: "Muslims are brothers to one another. None of them has any preference over another, except on grounds of piety." (ibn Kathir, Tafsir al-Qur'an al-'Azim, Matba'ah Mustafa Mohammad, Egypt, 1937, 4, p. 217).

"Oh men, beware, your God is one. An Arab has no preference over a non-Arab, nor a non-Arab over an Arab, nor a white over a black nor a black over a white, save on grounds of piety" (Alusi, Ruh al-Ma'ani, Idarat al-Taba'at al-Muniriyyah, Egypt, 1345-1926, 26, p. 148; ibn al-Qayyim, Zad al Ma'ad, Matba'ah Mohammad 'Ali Sabih, Egypt, 1935, 4, p. 31).

"Whosoever declares that there is no god but God, and faces our qiblah (direction of prayer), and offers prayer as we offer, and eats of the animal we slaughter, is a Muslim. He has the rights of a Muslim, and the duties of a Muslim." (Bukhari, Kitab al-Salah, Ch. 38).

"A Muslim's blood is like another Muslim's blood. They are one as distinguished from others, and an ordinary man of them can offer dhimmah (i.e. stand surety) on their behalf." (Abu Dawud, Kitab al-Diyat, Ch. 11; Nasa'i, Kitab al-Qasamah, Chs. 10 - 14).

"A Muslim is exempt from poll-tax." (Abu Dawud, Kitab al-Imarah, Ch. 34).

3. Tradition: "Nations before you were destroyed because they punished those among them of low status according to law, and spared the high ranking. By God, who holds my life in His hand, if Fatima, daughter of Mohammad, had committed this theft, I would have chopped off her hand." (Bukhari, Kitab al-Hudud, Chs 11, 12).

Says 'Umar, "I myself have seen the Prophet of God allowing the people to avenge themselves on him." (Abu Yusuf, Kitab al-Kharaj, al Matba'at al-Salafiyyah, Egypt, 2nd ed. 1352/1933, p. 116; Musnad, Abu Dawud al-Tayalisi, Tr. No. 55, Dairatul-Maarif, Hyderabad, 1321/1903)

4. Qur'an, 4:58

Tradition: "Mind, each one of you is a shepherd and each one is answerable in respect of his flock. And the chief leader (i.e. the Caliph) is answerable in respect of his subjects." (Bukhari, Kitab al-Ahkam, Ch 1; Kitab al-Imarah, Ch. 5).

5. Qur'an (13:38)

Tradition: "'Ali reports that he asked the prophet of God (on him be peace), 'What shall we do if we are faced with a problem after you die about which there is no mention in the Qur'an nor have we heard anything concerning it from your lips?' He answered, 'Collect those of my people (Ummah) that serve God truthfully and place the matter before them for mutual consultation. Let it not be decided by an individual's opinion.'" (Alusi, op, cit, 25, p.42)

6. Tradition: "It is incumbent on a Muslim to listen to his Amir and obey, whether he likes it or not, unless he is asked to do wrong. When he is asked to do wrong, he should neither listen nor obey." (Bukhari, Kitab al-Ahkum, Ch. 4; Muslim, Kitab al-Imrah, Ch. 8; Abu Dawud, Kitab al-Jihad, Ch. 105; Nasa'i, Kitab al-Bas'ah, Ch. 33; ibn Majah, Abwab al-Jihad, Ch. 40).

"There is no obedience in sin against God. Obedience is only in the right." (Muslim, Kitab al-Imarah, Ch. 8; Abu Dawud, Kitab al-Jihad, Ch. 95; Nasa'i, Kitab al-Bai'ah, Ch. 33).

"Do not obey those of your rulers that command you to disregard the order of God." (Ibn Majah, Abwab al-Jihad, Ch. 50).

7. Tradition: "Verily, we do not entrust a post in this government of ours to anyone who seeks or covets it." (Bukhari, Kitab al-Ahkam, Ch. 7).

"The most trustworthy of you with us is he who comes forward to seek position in the government." (Abu Dawud, Kitab al-Imrah, Ch. 2).

The Prophet of God said to Abu Bakr, "Oh Abu Bakr, the best fitted person for the government is he who does not covet it, not he who jumps at it. He who knows its responsibility and tries to shun it deserves it most, not he who proudly advances to collect for himself. It is for him to whom you could say, "You most deserve it," not for him who says of himself, "I am most deserving." (al-Qalqashandi, Subh al-A'sha, dar al-Kutub al-Misriyyah, Cairo, 1910, 1, p. 240).

8. Qur'an 22:41

9. Tradition: "Whoever of you sees an evil thing let him undo it with his hand. If he cannot, let him check it with his tongue. If he cannot do even this, let him despise it with his heart and wish it otherwise, and this is the lowest degree of faith." (Muslim, Kitab al-Iman, Ch. 20; Tirmidhi, Abwab al-Fitan, Ch. 20).

"Then the undeserving will take their place who will say what they will not do, and will do what they are not asked to do. Therefore, he who strives against them with his hand is a believer, and he who strives against them with his tongue is a believer, and he strives with his heart is a believer, and there is no degree of faith below this." (Muslim, Kitab al-Iman, Ch 20.)

"The best of jihad (endeavour towards God) is to say the right thing in the face of a tyrant." (Abu Dawud, Kitab al-Malahim, Ch. 27; Tirmidhi, Abwab al-Fitan, Ch. 12; Nasa'i, Kitab al-Bai'ah, Ch. 36i; ibn Majab, Abwab al-Fitan, Ch. 20).

"When the people see a tyrant and do not seize his hand, it is not far that God should afflict them with a general ruin." (Abu Dawud, Kitab al-Malahim, Ch. 17; Tirmidhi, Abwab al-Fitan, Ch. 12).

"Some people are going to be rulers and not after me. He who supports them in their wrong and assists in their tyranny has nothing to do with me, nor Have I anything to do with him." (Nasa'i, Kitab al-Bai'ah, Chs. 34, 35).

10. Al-Tabari, Tarikh al-Umam w-al-Muluk, al-Matba'at al-Istiqamah, Cairo, 1939, Vol 2, p. 618

11. The reference was to the abrupt rising of 'Umar from his place during the meeting at Banu Sa'idah's Meeting House when he proposed Abu Bakr's name as the Prophet's successor and extending his hand to him offered him allegiance. There has been long deliberation before electing Abu Bakr to be Caliph.

12. Bukhari, Kitab al-Muharibin, Ch. 16; Ahmad, Musnad, Third edition, Dar al-Ma'arif, Egypt, 1949, 1. Tr. 391. According to this version, the words are as follows, "Whoever swears allegiance to an Amir without the consultation of Muslims offers no allegiance, and he who receives allegiance from him receives no allegiance." In another version the following words are reported, "He who is offered allegiance with consultation, it is not lawful for him to accept it." (Ibn Hajar, Fath al-Bari, al-Matba'at al-Khairiyyah, Cairo, 1325/1907, Vol, 2, p. 125)

Chapter 34: Abu Hanifah and Abu Yusuf

A. Abu Hanifah

Life

It was under the circumstances explained at the close of the preceding chapter that Abu Hanifah appeared on the scene and began his work. His original name was Nu'man bin Thabit. Born in Kufah, capital of Iraq, in 80/699 according to authentic reports, in the reign of 'Abd al-Malik bin Marwan, when Hajjaj bin Yusuf ruled over Iraq, he lived the first 52 years of his life in the Umayyad regime, the latter 18 in the 'Abbasid reign. He was 15 years old when Hajjaj left the stage, at the time of 'Umar bin 'Abd al-'Aziz when he was a youth. The stormy days of the rule of Yazid bin Muhallab, Khalid bin 'Abd Allah al-Qasri and Nasr bin Sayyar, over Iraq, passed before his eyes.

He himself was a victim of the persecution of ibn Hubairah, the last Umayyad governor. He saw the rise of the 'Abbasid movement with its centre at Kufah, his home town, which remained virtually the main stronghold of the new born 'Abbasid State before the founding of Baghdad. His death occurred in 150/767 during the reign of Mansur, the second 'Abbasid Caliph.

Abu Hanifah's ancestors belong to Kabul. His grandfather, Zuta (according to some, the pronunciation is Zauta), came to Kufah as a prisoner of war, accepted Islam, and settled there under the friendly protection of Banu Taim Allah. Zuta was a trader by profession and was known to 'Ali, the "Right-going" Caliph; in fact, he was close enough to him and sometimes entertained him with gifts.¹ Abu Hanifah's father, Thabit, also owned a business at Kufah. According to a report coming from Abu Hanifah, he owned a bakery there.²

Abu Hanifah's own account of his education describes him as applying himself first to recitation (reading the Qur'an properly), Hadith (Tradition), grammar, poetry, literature, philosophy and other subjects in vogue in those days.³ Then he turned to specialize in dialectical theology and mastered it to such a degree that people looked to him as an authority in that science. His student, Zufar (bin al-Hudhail), reported that his master told him that at first he took such an interest in theology that people would lift their fingers towards him.⁴ In another report Abu Hanifah says that at one time he was a past master in the art of controversy and spent most of his time in debates. As Basra was the main venue of these contests, he had been there about 20 times, occasionally staying there for six months or so at a stretch and remained engaged in controversies with the different sects of Kharijites, the Ibadiyyah, the Sufriyyah, and Hashwiyyah.⁵

It may be easily concluded from this that he was well versed in philosophy, logic, and theological divergences of the numerous sects without which a man cannot enter the field of controversy at all. The beautiful use that he later made of reason and common sense in the interpretation of Law and the resolving of abstruse legal problems won him immortal fame and a great deal to the intellectual training which he had received earlier from these exercises of logical argumentation.

After keeping himself busy in polemical controversies for a long time and growing sick of them, he turned to Fiqh, i.e. Islamic Law. Here, with the strength of mind that he possessed, he could not interest himself in the Traditionist school (ahl al-hadith). He, therefore, joined the Iraqi school of reason with its centre at Kufah. This school of law traced its origin to ‘Ali and ibn Mas‘ud (d. 32/652), after whom their disciples Shuriah (d. 78/697), ‘Alqamah (d. 62/681), and Masruq (d. 63/682) became its accredited leaders, followed in their turn by Ibrahim Nakh‘i (d. 95/714) and Hammad (d. 120/737). Abu Hanifah took Hammad for his master and kept him company for 18 years, until the latter’s death. Frequently, he also consulted other learned masters of Law and Tradition in the Hijaz on the occasions of pilgrimage, and acquainted himself also with the Traditionist school of thought.

On Hammad’s death he was chosen to succeed him. He occupied that place for 30 years, delivering lectures and discourses, issuing legal verdicts, and doing the work which formed the foundation of the Hanafi School of law named after him. In these 30 years he answered some 60,000 (according to other estimates, 83,000) legal queries, all of which were later compiled under different heads in his lifetime.⁶ Some seven to 800 of his students spread to different parts of the Islamic world and filled important seats of learning. They were entrusted with issuing legal opinions and guiding the education of the masses, and became objects of heartfelt veneration for the multitudes. About 50 of them were appointed judges after his death during the ‘Abbasid reign. The law which he codified by him was adopted as the law of the great part of the Muslim world. The ‘Abbasids, the Saljuqs, the Ottomans, and the Mughuls accepted it and with millions of people still following it today.

Abu Hanifa, like his forefathers, earned his living by trade. He dealt in a kind of cloth, called khazz, in Kufah. Gradually, his business flourished until he had a factory where this cloth was manufactured.⁷ The business was not restricted to Kufah; his goods had a good market in far off places. The growing recognition of his integrity converted his firm into a bank where people deposited huge sums of money on trust. These deposits ran to 50 million dirhams at the time of his death.⁸

Extensive experience of financial and commercial matters gave him a deep insight into various aspects of law such as seldom falls to the lot of a theoretical lawyer. Later on, when he set himself to the task of codifying the Law of Islam this personal experience proved of immense help to him. A further testimony to his deep understanding and proficient handling of practical affairs is provided by the fact that when in 145/762 Mansur undertook the task of constructing the new city of Baghdad, he appointed Abu Hanifah to supervise the work and for four years it remained under his supervision.⁹

In his private life he was most pious, a man of known integrity. Once he sent out his partner in business to sell some merchandise. A part of the goods to be sold were defective and he instructed his partner to let the buyer know the defect. The partner, however, forgot to do so, and returned after selling the whole without apprising the buyer of the defect. Abu Hanifah did

not keep the money. He gave away the whole of it (and it amounted to 35,000 dirhams) to charity.¹⁰

His chroniclers have recorded occasions when ignorant people would come to his firm selling goods at lower rates than what they were worth. Abu Hanifah would tell them that their wares were worth more than what they would put them at, and bought them at their actual rates.¹¹ All his contemporaries speak highly of his honesty. The famous learned divine, ‘Abd Allah bin Mubarak¹² said, “I have yet to see a more pious man than Abu Hanifah. What will you say about the man to whom they offered the world and its wealth and he kicked it away, who was flogged and remained steadfast, and who never accepted those posts and honours which people hankered after.”

Justice ibn Shubrumah said, “The world followed him but he would have none of it. As for us, the world would have none of us and we run after it.”¹³ According to Hassan bin Ziyad, Abu Hanifah never accepted a gift or favour from the rich.¹⁴

He was also very generous, never sparing in spending, particularly on the learned and the scholarly. A part of his profits was ear-marked for them and expended throughout the year, and whatever of it was left over was distributed among them. Extending them such help he would say, “Be pleased to spend it on your needs, and thank none but God for it. I do not give you anything of mine for it is a bounty from God. He has given it to me for your sake.”¹⁵ A number of his students depended entirely on him, particularly Yusuf. He met all the expenses of the latter’s house since his parents were poor and wanted their son to give up studies and take to some work to earn a living.¹⁶

That was the man who tackled in the first half of the second/eighth century the knotty problems arising from the awkward circumstances that followed the “Right-guided” Caliphate.

Abu Hanifah’s Pronouncements and Opinions

First of all, we shall take those problems about which his opinions as recorded by himself are available to us. He has no prolific writer, therefore, in order to know his views we have to generally resort to other reliable sources. But on certain issues, mainly raised by the above-mentioned sects (the Shi‘ites, the Kharijites, the Murji‘ites, and the Mu’tazilites) he has written, against his wont, with his own pen, drawing up in brief but eloquent words the creed and doctrine of the ahl al-sunnah w-al-jama‘ah (lit., the followers of the Prophet and his Companions’ tradition) who formed (as they still do) by far the largest section of the Muslim community. Naturally, in an estimate of his work the first place must be given to what flows from his pen.

Al-Fiqh al-Akbar

We have already stated in the preceding chapter how the differences that cropped up among the Muslims during ‘Ali’s reign and the first years of the Umayyad regime led to the birth of four big sects in the community, which not only expressed but also adopted as tenets of faith contradictory opinions on certain vital issues affecting the constitution of Muslim society, the

Islamic State, the sources of Islamic Law, and the decisions in regard to these matters was clear; it was embodied in the practice of the great divines and men of learning. But nobody had drawn up in clear cut words and put it into the form of a treatise. Abu Hanifah was the first person to put down perspicuously in his famous work, *al-Fiqh al-Akbar*,¹⁷ the Sunni point of view regarding matters of divergence against the doctrines of other sects.

The first question relevant to our discussion answered by him in the book is regarding the position of the “Right-guided” Caliphs. The dissenting sects had posed the question about some of them whether they were rightly raised to the office of the Caliphate. Some wanted to know who were superior to whom, and whether there was any among them who could not be called a Muslim at all. These questions were not merely queries regarding some personages of old history; in fact, they mooted another fundamental question, viz., whether the way these Caliphs were elected to their office was to be recognized as the constitutional way of electing the Head of the Islamic State or not. Moreover, if the title of anyone of them proved doubtful, the question would be raised whether the decisions taken by “consensus of opinion” in his regime would form part of the Islamic Law or not, whether his own decision would continue to form precedents in law or cease to operate as such.

Besides that, the questions whether they were entitled to the Caliphate, whether they were endowed with faith at all, and whether some of them were superior to others, naturally gave rise to another question of a very vital import, and that was, whether the Muslims of later times could repose any trust in either the members or the collective decisions of the early Islamic community brought up under the direct care and supervision of the Prophet of God, the people through whom the teachings of the Qur’an, the Prophet’s Tradition, and the Islamic Law came to be transmitted to later generations.

The second question related to the position of the Prophet’s Companions. One of the sects, the Shi‘ah, called the vast majority of these Companions sinners, gone astray and even infidels, because they had selected the first three Caliphs to rule them, and a fair number were put outside the pale of faith or declared “transgressors” by the Kharijites and the Mu‘tazilites for reasons of their own. This, too, was not a purely historical question, for it naturally led one to ask whether the laws and traditions transmitted by persons of doubtful bona fides to posterity would remain authentic sources of Islamic Law or not.

The third basic question dealt within the book relates to “faith,” its definition and distinction from disbelief, and the consequences of sin, issues of grave controversy and debate in those days among the Kharijites, the Murji‘ites, and the Mu‘tazilites. This again was not merely a theological question but one that was closely related to the constitution of Muslim society and its answer affected the civic rights and social relations of Muslims. A question that closely followed from it was whether in a Muslim State governed by the sinful and the wrong-doer, it was possible to perform correctly such religious duties as the Friday and other prayers, or political functions like dispensing justice or participating in war.

Abu Hanifah's answers to these questions embodying the Sunni creed are as follows:

1. "The best of men after the Prophet of God (on who be peace) was Abu Bakr. After him was 'Umar, after him 'Uthman, and after him 'Ali. They were all just men and abided by the right."¹⁸ 'Aqidah Tahawiyyah further explains it like this, "We believe Abu Bakr (with whom God be pleased) to be the best of men after the Prophet of God (on whom be an everlasting peace). We recognize his title as the Caliphate as prior to that of others, then 'Umar's, then 'Uthman's, then 'Ali's - and they are the Right-guided Caliphs and the 'Right-going leaders.'"¹⁹

It is a matter of interest to note that personally Abu Hanifah loved 'Ali more than 'Uthman,²⁰ and believed that neither of them should be ranked above the other.²¹ Formulating the creed, however, he accepted wholeheartedly the decision of the majority of his day in choosing 'Uthman as Caliph after 'Umar, and agreed that in the ranking of the "Right-guided" Caliphs the order of their Caliphate was also the order of their superiority to one another.

2. "The Companions of the Prophet are not to be spoken of but respectfully."²² 'Aqidah Tahawiyyah elucidates it further, "We treat all the Companions of the Prophet respectfully. We do not love anyone of them beyond measure, nor censure anyone of them. We do not like one who bears them or mentions them with disrespect. We mention them in none but a good way."²³

Abu Hanifah did not hesitate to express his opinion on the mutual war of the Companions, and said unambiguously that in the war between 'Ali and his adversaries (and evidently the participants of the battles of the Camel and Siffin are included among them) 'Ali stood by right more than they,²⁴ yet he altogether refrained from inflicting reproach on the other side.

3. "Faith is synonymous with owning and believing. To have faith is to own and believe (in God and his Prophet)."²⁵ In al-Wasiyyah it is explained in these words, "To have faith in something is to own it with the tongue and believe in from the heart," and further, "Faith is not owning alone, nor believing alone." In another place we find, "Action is something different from faith, and faith is different from action. Often a man is exempt from a certain action but he is not exempt from faith. For instance, it may be said that a poor man is exempt from the payment of zakat (prescribed charity), but it cannot be said that he is exempt from bearing faith, also."²⁶ Thus, Abu Hanifah refuted the Kharijite theory that action formed part of faith and hence sin was synonymous with disbelief, or, in other words, that a crime necessarily meant treason.

4. "We do not ex-communicate a Muslim for any sin, however grave it may be, unless he affirms that it is 'allowed.' We do not divest him of belief. We call him a believer. A believer may be a transgressor, without being an infidel."²⁷

In al-Wasiyyah he writes, "The sinners among the followers of Mohammad (on whom be peace) are all believers, not infidels."²⁸ 'Aqidah Tahawiyyah elucidates further, "A man does not go out of the pale of faith except by denying the creed that had put him inside it."²⁹ A discussion of

the Kharijites with Abu Hanifah over this issue throws further light on this doctrine and its social consequences. A large part of them once came to him and said, "There are two biers at the gate of the Mosque. One is of a drunkard who died drinking, the other of a woman who had gotten herself illicitly pregnant and too her own life in shame."

"To which community did they belong? Jews were they?" he asked.

"No," they said.

"Christians, then, or Majusis?"

"No," they answered again.

"Then, to which community did they belong?" he asked.

"To the community which bears witness to the creed of Islam," they replied.

"Is that one-third of the faith or one-fourth of faith?" he asked.

They said, "There is no one-third or one-fourth of faith."

"After all, what part of faith is this bearing witness to the creed of Islam?" he said.

"The whole faith," they said.

"When you yourself call them faithful, what is it you want of me?" he asked.

"We ask whether they would go to heaven or hell."

He replied, "If you ask me that, I will say about them what the Prophet of God, Abraham, said about sinners worse than they, 'Oh God, he who follows me is mine, and he who disobeys - Thou art the Forgiving, the Compassionate', or what the Prophet of God, Jesus, said about sinners worse than they, 'If You punish them they are Your creatures, and if You forgive them, Thou art All-powerful and wise', or what the Prophet of God, Noah, said, 'Their reckoning rests with God, would that you understood, and I do not wish to turn my back upon the believers.'"³⁰

Hearing this, the Kharijites felt out-witted and avowed their mistake.³¹

5. "Prayers can be offered behind any of the faithful, good or bad."³² 'Aqidah Tahawiyyah elucidates it further like this, "The pilgrimage and jihad (war) will continue to be performed to the Day of Judgment under the rulers of the faithful, whether they be good or bad. Nothing will make them unlawful or discontinue them."³³

Al-Jassas has more clearly explained Abu Hanifah's point of view in this matter. "Some people," he writes, "suppose that Abu Hanifah approves the Imamate or Caliphate of the corrupt. If it has been deliberately invented, the misunderstanding probably springs from this that Abu Hanifah (and not he alone, all the learned scholars of Iraq whose opinions are widely known are one with him in this) says that if a judge is himself just, his decisions will be accepted, no matter how corrupt a master has appointed him, and prayer may be lawfully offered behind corrupt masters despite their corruption. This attitude is absolutely correct in its own place, but it does not mean that Abu Hanifah finds no fault with the Caliphate of the corrupt."³⁴

These elucidations make it clear that Abu Hanifa, unlike the Kharijites and Mu'tazilites, differentiated between Caliphs de jure and Caliphs de facto. A necessary corollary to the position taken by the above-mentioned sects was that in the absence of a just and pious ruler, i.e. a Caliph de jure,

all functions of Muslim society and State would remain suspended. There would be no pilgrimage and no Friday or other congregational prayer, the courts would stop, and there would no other religious, social, or political work. Abu Hanifah, on the other hand, contended that if at a time the Muslims were deprived of a Caliph de jure, the functions of their society would continue to be exercised lawfully under a Caliph de facto, though his right to caliphate may be disputable. In the pages to come we shall point out what, according to him, were the essential pre-requisites of a lawful Caliphate and what he thought of corrupt and unjust Caliphs.

6. “We do not say that sin does not do a believer any harm. We neither say that a believer will never go to hell, nor that he will live eternally in hell if he is a transgressor.”³⁵ “We also do not say, like the Murji’ites, that our good deeds will be certainly rewarded and our bad deeds undoubtedly forgiven.”³⁶

‘Aqidah Tahawiyah has a further addition to it, “We decide in respect of no believer that he is destined to go to heaven or to hell. We do not accuse any Muslim of infidelity, polytheism, or hypocrisy, unless we see him actually engaged in them. As for intentions and motives we leave them to God to judge.”³⁷

Thus, Abu Hanifah steered a middle course through the opinions held by the Murji’ites, the Kharijites, and the Mu‘tazilites, and formulated a doctrine of balance which, on the one hand, preserves the Muslim society from disintegration through mutual hatred and violence, and, on the other, insures against its falling into moral indiscipline and getting emboldened to commit sins with impunity.

Abu Hanifah on State and Caliphate

The opinions mentioned above related to issues which had cropped up in consequence of the political turmoil of the day and vitally affected the legal system and the political and social orders of Muslim society. Now, let us examine Abu Hanifah’s views concerning the State and Caliphate. Since there is no work of his own touching these matters, we have to resort to the following two kinds of sources for information: first, his opinions quoted in the traditions and books of the Hanafi School and, secondly, the attitude he adopted towards his contemporary governments of the Umayyads and the ‘Abbasids. The latter also includes a number of spoken words coming from his mouth during the course of his struggle with these governments, and these throw further light on his points of view under discussion.

The Problem of Sovereignty and Legislation

Abu Hanifah’s views on sovereignty were identical with the generally known basic view of Islam on this issue, namely, 1) that the true sovereign is God, 2) that the Prophet is to be obeyed as God’s accredited vicegerent, and 3) that the Shari‘ah, i.e. the Law of God and His Prophet, is the supreme Law to which all must submit with demur or reservation. Abu Hanifa, pre-eminently a jurist, has stated this doctrine rather in terms of law than of politics. He says, “When I find an order in the Book of God, I take it from there. When I do not find it there I take from the accredited practice, word,

or tradition of the Prophet, coming down to us through reliable sources. When I do not find it either in the Book of God or in the Prophet's Sunnah, I follow the (agreed) opinion of the Prophet's Companions. In case of difference of opinion among them I adopt the opinion from outside...As for others, I have as much right to sift and draw conclusions as they have."³⁸

Ibn Hazm states, "All his students are agreed that Abu Hanifah's practice was that even a weak tradition was to be preferred to (one's own opinion formed by analogical reasoning (qiyas) or private judgment (ra'y))."³⁹

This leaves absolutely no doubt that Abu Hanifah regarded the Qur'an and the Sunna as the final authority. Legal sovereignty, according to him, rested with God and the Prophet, and reason and judgment (qiyas and ra'y) were to be employed in the service of legislation only in matters where they had given no instruction. The precedence given by him even to an "isolated" opinion of the Companions was also based on the possibility of their being aware of some instruction from the Prophet (about the matter under reference) which may have been the basis of the opinion.

That was also why, when he saw a difference among the Companions, he accepted the opinion of some of them rather than differ with all of them - he would avoid the danger of going against the Sunnah, even inadvertently. In any case, he employed to the utmost power of reasoning and judgment to find out whose opinion seemed best to approximate the Sunnah.

The charge that he preferred to his own discretion to a clear ordinance (nass) was laid at his door even in his life-time but he refuted it say, "God knows that he who stated that I preferred my own discretion to 'ordinance' told a lie and accused me unjustly. How can we dare use our discretion when we have an 'ordinance?'"⁴⁰ The Caliph Mansur once wrote to him saying that he had heard that he (Abu Hanifah) gave precedence to deductions from analogy over the Prophets tradition. In reply, he wrote, "Oh Commander of the Faithful, what you have heard is incorrect. I go first by the Book of God, then by the Sunnah of the Prophet, then the decisions of Abu Bakr, 'Umar, 'Uthman, and 'Ali and then the decisions of other Companions, but when I find disagreement among them, I resort to discretion"⁴¹.

Establishment of the Caliphate

Regarding the Caliphate his views were most clear cut and unambiguous. According to him, to seize power by force and later regularize it by exacting allegiance under duress was no lawful way of being chosen for it. A Caliph should be chosen after consultation and in conference with the wise that are entitled to give opinion (ahl al-ra'y). Abu Hanifah expressed this opinion in face of the peril of losing his life. Mansur's Chamberlain, Rabi' bin Yunus, relates that the Caliph summoned Malik ibn Abi Dhi'b and Abu Hanifah before himself and asked, "What do you say about this power that God has given me over the people, am I not deserving of it?"

Malik answered, "Had you not deserved, God would not have conferred it on you."

Said ibn Abi Dhi'b, "God grants the kingdom of the world to whom He pleases, but the kingdom of the hereafter is given to him who strives for it and is helped by God to make way to it. The help of God will attend you if

you obey him; in case you disobey, it will keep away from you. As for the Caliphate, the truth is that only a conference of the God-fearing can institute it, and one who seizes it by force has no righteousness in him. You and your associates are deprived of the help of God, and have turned aside from truth. Now, if you ask the Almighty to grant you peace and try to gain nearness to Him with deeds of piety, you may win His grace, otherwise, you are only a self-seeker.”

Abu Hanifa tells us that when ibn Abi Dhi’b spoke those words, Malik and he folded their clothes about them expecting his head to be off his shoulders that very moment and his blood to fall on these clothes. But Mansur turned to Abu Hanifah and inquired, “What say you?”

He replied, “The man who sincerely seeks the right path to guide himself eschews wrath. If you consult your conscience you will see that you have not invited us for the sake of God but make us say, out of dread, something that suits you and that should reach the people. The truth is, you have become a Caliph without even a couple of men from amongst the ahl al-fatwa (those whose opinion is respected as authoritative) agreeing to it, whereas a Caliph should be chosen with the conference and concurrence of Muslims. You know, Abu Bakr refrained from making decisions for six months until the (news of the) Yemenites’ allegiance arrived.”

Then all three rose and went their way. Mansur dispatched Rabi’ after them with a bag full of coins for each with instructions that if Malik accepted it, it should be made over to him, but if Abu Hanifah or ibn Dhi’b accepted it, he should bring their heads to him. When the gift was offered to Malik he took it, but when Rabi’ offered it to ibn Abi Dhi’b he said that he did not consider it lawful for Mansur himself, how could it be lawful for him. And Abu Hanifah said, “I will not touch it, not even if you cut off my head.” When Mansur heard it, he said, “Their contentment has saved their lives.”⁴²

A Caliph’s Qualifications

Until Abu Hanifah’s time the qualifications which entitled a man to Caliphate were not described at length as they were compiled later by scholars like Mawardi and ibn Khaldun. They were for free, and well versed in religion, and sound body and mind. Two things, however, were doubtful and needed clarification: first, whether a ruthless or corrupt person could be a Caliph or not; secondly, whether it was necessary for a Caliph to belong to the tribe of Quraish.

Abu Hanifah’s opinion with regard to the first was that a Caliph must be a just person. One who is cruel and corrupt cannot be a Caliph, a judge, a governor, a pronouncer of legal verdict (Mufti), or an arbiter. If such a person comes to office, his Caliphate will be null and void and the public owes him no obedience. However, notwithstanding his usurpation of power, all the social dealings and obligations executed by Muslims under him in accordance with the Shari’ah will have legal sanction and the just decisions of the judges appointed by him will take effect.

Abu Bakr al-Jassas, a well-known Hanafi jurist, has explained this point in greater detail. He observes, “It is not lawful that a cruel or corrupt person should be a prophet or his successor (Khalifah) or a judge or hold any office

by virtue of which he should be in a position to impose his will on the people in matters relating to religion; he cannot, for example, be a Mufti or a witness or a reporter of the Prophet's traditions. The Qur'anic verse, "My covenant does not extend to the wrongdoers"⁴³ shows that all those people who come to the helm of affairs in matters connected with religion must be just and virtuous.

This verse categorically proves that the Caliphate of the corrupt is unlawful. No person of wicked reputation can be a Caliph. If any of that character should install himself in that office, the people are under no obligation to follow or obey him. The same was meant by the Prophet of God (on whom be peace) when he said that none among the created was entitled to command obedience in defiance of the Creator. The verse is also conclusive that no corrupt person can become a judge, a governor, or a magistrate, and if he becomes one, his orders will not be valid. Nor can his evidence be acceptable, nor his transmission of a report from neither the Prophet of God, nor the verdict (fatwa) of which he is the pronouncer."⁴⁴

Al-Jassas further affirms that this was Abu Hanifah's opinion. He regrets how unjust it is to accuse him of allowing the Caliphate of the corrupt. We have already alluded to that controversy and need not repeat it here.

Al-Dhahabi also affirms this to be Abu Hanifah's view. According to him, Abu Hanifah held that the caliph who misused public money (fay') or gave unjust orders was not entitled to remain Caliph and his orders were not valid.⁴⁵

About the second question Abu Hanifah's opinion was that the Caliph should belong to the tribe of Quraish.⁴⁶ Not this alone; it was the agreed view of all the Sunnites.⁴⁷ However, they held this view not because the Caliphate was constitutionally the exclusive right of one tribe, but because in the particular circumstances of those days only a Quraishite Caliphate could hold all Muslims together. In other words, this opinion was based on political expediency of time and not on any legal constitutional right of the Quraish. Ibn Khaldun explains in detail that in those days the Arabs were the mainstay of the State and there were far more chances of the Arabs agreeing on a Quraishite Caliph than on anyone from some other tribe.

The chances of strife and rift that lay in the choice of a non-Quraishite Caliph were so many that none could afford to put the Caliphate in that peril.⁴⁸ That incidentally unfolds the wisdom and implications of the Prophet's timely instruction that the Imams should be chosen from the Quraish.⁴⁹ Had the Caliph's office been forever forbidden to the non-Quraishite, 'Umar would not have said at the hour of his death, "If Hudhaifa's freed slave Salim, were alive, I would have proposed him my successor."⁵⁰

The Prophet, while instructing the Caliphate should go to the Quraish; he had made it clear that this office would be held by the Quraish as long as they retained certain merits.⁵¹ This clearly implied that when the Quraish became bereft of those merits, the Caliphate should devolve on the non-Quraish. This was the essential difference between the view of the Sunnites, including Abu Hanifah on one side and that of the Kharijites and Mu'tazilites on the other. The latter allowed Caliphate for the non-

Quraishites irrespective of all conditions. Not only that, they went a step further and said that the non-Quraishites had a better title to it. Their main anxiety seemed to be democracy, even though it might lead to confusion and disintegration. With the Sunnites, democracy and the stability of the State were equally important considerations.

The Exchequer and the Public's Right of Ownership

The most reprehensible of all indulgences of the Caliphs of his day in eyes of Abu Hanifah were their reckless waste of public exchequer and their illegal seizure of people's properties. As we have already quoted al-Dhahabi, according to Abu Hanifah, oppression and illegitimate use of public money in a ruler rendered his title to Caliphate void. Not only that, he even did not allow the tokens of goodwill and presents received from foreign States to be made the personal property of the Caliph. These things were also deposited into the treasure, not with the Caliph or his family, for the obvious reason that had he not been the head of State and thereby become conspicuous in the international world, none would have sent him those presents.⁵² He also objected to the Caliph's squandering of public money and his giving gifts out of it. This was one of the main reasons why he himself accepted no gifts from the Caliphs.

Separation of the Judiciary from the Executive

His views on the position of the judiciary vis-a-vis the executive were unequivocal. If justice was to be ensured, he said, the judiciary must be independent of the executive. Not only that, the judge must also be able to enforce his decree against the Caliph if the latter encroached upon the rights of people. Towards the close of his life when he was sure that the Government would not let him live any more, he gathered his disciples and addressed himself to them. Among other important things, he gave them this instruction, "If the Caliph is guilty of encroachment upon the rights of the people, the judge next to him in rank (i.e. the Chief Justice) should make him submit to the rule of Law."⁵³

The main thing which prevented him from accepting an official position, particularly of a judge during the Umayyad and 'Abbasid rule was that he did not see the judiciary as independent. There was no chance of making the Caliph submit to the rule of law. On the other hand, he feared that he would be made an instrument of injustice and asked to give wrong decisions, and that not only the caliph himself but also those attached to the palace would interfere with his work.

Yazid bin 'Umar bin Hubairah was the first of the Umayyad governors of Iraq who pressed Abu Hanifah to accept office. This was in 130/747 when the upsurges in Iraq against the Umayyad regime were rising with a speed that completely overthrew that government within a couple of years. Ibn Hubairah wanted to enlist the support of influential men of learning and use them to the advantage of the Umayyad cause. He invited ibn Abi Laila, Dawud bin Abi al-Hind, ibn Shubrumah, and others and gave them lucrative appointments. Then summoning Abu Hanifah, he said, "Here I give you me seal. No order will be enforced here until you put the seal on it, and no money will be drawn from the treasury without your sanction." But Abu

Hanifah declined to accept the responsibility. Yazid put him in prison and threatened him with whipping.

Then the other learned men came round Abu Hanifah and requested him to take compassion on himself. "This service is as repugnant to us," they said, "as it is to you. But we have accepted under duress, so should you." Abu Hanifah replied, "Ah! Had he asked me to count the gates of the mosque of Wasit, I would not have done it for his sake. Then how can I agree that he should write the death warrant of an innocent person and I should put the seal on that order? By God, I will accept no share of his responsibility." Ibn Hubairah then made him other offers but found him cold. At last, he decided to appoint him the Chief Judge of Kufah and swore that if Abu Hanifah declined the appointment he would have him flogged. Abu Hanifah swore in return saying that the flogging of this world was easier for him to endure than the flogging of the hereafter, reiterating that he would never accept it, even though that would cost him his life.

At last the tyrant gave him 20, or (according to another report) 30, blows of the stripe on the head. According to some accounts, he kept it up with ten stripes daily for about 11 days, but found his victim firm like a rock. Then someone informed him that he was likely to die. Ibn Hubairah replied, "Is there none to counsel this man to ask me for a reprieve?" When Abu Hanifah heard of this he asked to be set free for Mecca, not to return to it before the final wiping out of the Umayyad dynasty.⁵⁴

In the 'Abbasid period, again Mansur insisted he accept the office of a judge. As we shall presently see, Abu Hanifah, having openly participated in a revolt launched against Mansur by al-Nafs al-Zakiyyah and his brother Ibrahim, Mansur cherished such malice against him that in al-Dhahabi's words, he was all but consumed in the fire of wrath.⁵⁵ However, it was not easy to lay hands upon a person of Abu Hanifah's eminence. Mansur knew how the murder of Husain had provoked feelings of wrath against the Umayyads and how easily had they been uprooted on that account.

Therefore, instead of killing him, he would rather lure him into a cage of gold and use him to advance his ends. With this in view he offered him the post of a judge again and again, in the end asking him to become the Chief Justice of the whole of the 'Abbasid Empire, but Abu Hanifah always put him off under one pre-text or another.⁵⁶

Ultimately, seeing him persist too much he told him frankly the reason why he was unable to accept these offers. On one such occasion he excused himself politely saying, "None can be fit to become a judge unless he has strength enough to impose law on you, your princes, and your commanders. I have not that strength in me. I am so built that whenever you call me, I cannot breathe easily until I leave your presence."⁵⁷ On another occasion the talk took a harsh turn.

Addressing the Caliph, he said, "Even if I accepted this office willingly, not reluctantly, sure enough I would not prove worthy of your trust. If I decided a case against your desire and you wanted me to alter the decision on pain for being pushed into the Euphrates to drown, I would rather drown than alter my decision. When talks like these led Mansur to conclude that this man could not be caught in a cage of golden bars, he resorted to open

persecution. He had him whipped and flogged, put him in jail where they subjected him to tortures of hunger and thirst. Later, he was confined in a cell wherein he died, according to some, a natural death, according to others, of poisoning.⁵⁸

Freedom of Expression: A Right and a Duty

According to Abu Hanifah, freedom of expression in a Muslim society and in an Islamic State is of as much importance as the independence of the judiciary. The Qur'an terms this freedom as *amr bi al-ma'ruf and nahi 'an al-munkar* (enjoining the right and forbidding the wrong). No doubt, an unqualified right of freedom of expression may sometimes assume an unbecoming, mischievous, immoral, or even offensive form which no law can tolerate. But the Qur'an, by using the above-mentioned term for this freedom, clearly distinguishes it from all other kinds of freedom and, thus, circumscribing it within well-defined limits, declares it to be not only an inalienable right but also a duty of the public.

Abu Hanifah was particularly conscious of this right and duty because the political order of his day had rid the people of this right to such an extent that they actually doubted if it had anything of the nature of a duty about it. We have pointed out elsewhere that the Murji'ites, by preaching ultra-liberal doctrines were emboldening people towards sin. The Hashwiyyah professed that "Enjoining the right and forbidding the wrong" where the government was involved was mischievous and the Umayyad and 'Abbasid governments crushed the spirit of the people to raise a voice against the corruption and high-handedness of the ruling cliques. Abu Hanifah, with both speech and action, attempted to resurrect this spirit among the people and elucidated the extent to which it could be exploited. This is clear from Abu Hanifah's answer to a question from Ibrahim al-Sa'igh related by al-Jassas.⁵⁹

Abu Hanifah asserted the right of freedom of expression against law courts in the same manner, as well. If any court of law gave a wrong decision, he would not hesitate to point out whatever flaws of law or procedure he found in it. With him the respect of the courts did not mean letting the courts give wrong decisions. He was forbidden to pronounce verdicts on this account for a long time.⁶⁰

He was zealous in the matter of freedom of expression that he did not consider it lawful to imprison or otherwise punish a person who spoke ill, even of a legitimate ruler or his just government, not even if he went to the extent of abusing the Caliph and expressing an intention to kill him, until there was resolve on his part of an armed revolt or breach of peace. He argued this from an incident during the Caliphate of 'Ali. Five people were arrested and brought before him on the charge of abusing him openly in the streets of Kufah. One of them was also accused of saying that he would assassinate him. 'Ali ordered their release. It was said, "But they intended to kill you." He asked in reply, "But should I kill them only for expressing the intention to kill me?" It was added, "But they also abused you." He said, "If you like you may also abuse them."

The Question of Rebellion against Tyrannical Rule

Another important question that baffled the people of those days was whether or not it was lawful for the Muslim to rise in revolt against a ruler who perpetrated tyranny or transgressed the limits of Shari'ah. The Sunnis themselves were divided on this. A large section of the Traditionists (ahl al-hadith) allowed that they could raise voice against his tyranny and speak their mind before him but they could not rise in rebellion, even though he should seize upon their lawful rights and indulge in unjust bloodshed and open transgression.⁶¹ But Abu Hanifah's creed in this matter was that the Caliphate of an unjust incumbent was basically wrong and insupportable, and deserved to be overthrown, that people not only had the right, but it was their duty to rise in rebellion against it, that such a rebellion was not only allowed but obligatory, provided, however, that it promised to succeed in replacing the tyrant or transgressor by a just and virtuous ruler, and not fizzle out in mere loss of lives and power.

Private Council and Codification of Islamic Law

Abu Hanifah's greatest work which won him lasting eminence in the history of Islam was that he filled, on his own initiative, the vast gap caused in the Islamic legal system by the discontinuance of the shura (the Consultative Council) after the "Right-guided" Caliphate. We have already alluded to the consequences that followed this ill-happening. The loss resulting from this state of affairs lasting over a century was a matter of grave concern to every thinking person. The State had extended its boundaries from Spain to Sind, taking in its fold scores of peoples with various cultures, customs, rites, and habits of their own.

Facing it at home were problems relating to finance, commerce, agriculture, industry, marital relations, and the rest. There were civil and criminal cases to decide and ever-new constitutional, legal and procedural problems to solve. Abroad, the relations of this large State with the other States of the world, and issues like war, peace, diplomatic relations, foreign trade, communications (by land and sea), customs, etc., demanded urgent attention.

As the Muslims were a people with a distinct ideology, and claimed to guide themselves by principles and law of their own, it was necessary for them to solve their problems in the light of that ideology and those laws and principles.

But the institution of Shura having been discontinued there was no other properly established body or institution in which the trusted scholars, jurists, and lawyers of the community should meet to deliberate and devise such an authentic solution of every outstanding legal issue, as should be recognized as the accredited and uniform law of the land throughout the State. Thus, Islam was faced with a mighty challenge and there was no machinery to meet it.

The loss was being felt all round, from the Caliph to the governors and judges. It was not easy for every judge, lawyer, or head of a department to decide the innumerable problems that rose every day, there and then, on the strength of his own knowledge or by dint of his own understanding. Not only that, such individual decisions also conflicted with one another and created confusion. But a body whose verdict carried authority could be

established only the Government which, unluckily, lay in the hands of such people as knew for certain that they enjoyed no esteem or confidence with the public, nor were they prepared to face, nay, even endure, the learned, who, they feared, would confront them with things they would not like. They also knew that laws enacted under their patronage could never be accepted as parts of the Law of Islam.

Ibn al-Muqaffa' proposed to Mansur that in order to stop this gap he should convene a council of the learned lawyers of all schools of thought who should sit together and express their opinions on the various problems at hand. After hearing these opinions the Caliph himself should pronounce his decision on every case and that decision should be adopted as law. But Mansur knew his own position too well to make this mistake. His decisions could not equal decisions of Abu Bakr and 'Umar. They could, at best, have the whole realm that would respect and willingly follow a law enacted by him. He could make a secular law all right, but he could not make a law which would become incorporated in the Islamic juridical code.

In these circumstances it struck Abu Hanifah to try an entirely new path to redeem the loss, and this was to institute a private legislative body, on his own initiative, independent of the Government. Only a far-sighted person like him could think of such a plan and only he could dare the adventure who trusted his own resources, character, and moral prestige well enough to be sure that the laws passed by a body raised under his auspices would enforce themselves by dint of their excellence in sufficiency, precision, adaptability, and the moral influence of their devisers, even without any political sanction behind them, and they would be adopted by the people of their own accord, and recognized by the different governments of their own free-will.

Abu Hanifah was no seer of the hidden future to perceive the results which his efforts produced within half a century of his departure, but he knew himself and his colleagues well enough. He knew the collective temperament of his community and had an eye on the circumstances of this day. With the perfect eye of a man of sharp intelligence and foresight he gauged that he could fill the yawning gap with his private endeavour if he would, and that surely it would be filled satisfactorily.

Abu Hanifah's own students, trained under his care and guidance in his college of law for years in deliberating over legal questions, looking into them in the proper scientific spirit, and arriving at conclusions with arguments, formed the members of this council. Almost all of them had learned the Qur'an, literature, history, and Sirah (biography of the Prophet) not only from Abu Hanifah, but also from many other learned scholars of the day. Many of them had specialized in certain branches.

Some had made a name in the field of "arguing conclusions by analogy," others for incomparable knowledge of the Prophet's traditions and precedents set by the Companions, judges, and Caliphs of old. Others yet had a reputation for interpreting the Qur'an or for being skilled in a particular branch of law or in grammar on Sirah. Abu Hanifah himself once described them by saying, "These are 36 men of whom 28 are fit to be

judges, six to pronounce legal verdicts, and two good enough to teach judges and jurists.”⁶²

The procedure of work adopted in this council as reported by the authentic chroniclers of Abu Hanifah should be described in their own words. Al-Muwaffaq bin Ahmad al-Makki (d. 568/1172) writes, “Abu Hanifah framed his legal system with the consultations of his learned students. His passion to do all that he could for the sake of his religion and his love of God, the Prophet, and the believers did not allow him to undertake his work by himself to the disregard of his student colleagues.

He put every problem before them, threw light on its various aspects, carefully heard all that each one of them had to say on it and put forth his own point of view for their consideration. These deliberations and discussions were so exhaustive that some questions took a month or even more to decide. At last, when unanimity was achieved, Abu Yusuf recorded it in the fundamental compilations of Hanafi Law.”⁶³

Ibn al-Bazzaz al-Kardari (d. 827/1424), author of Fatawa Bazzayyah in his *Manaqib al-Imam al A‘zam*, “His students debated each question to their heart’s content and discussed it from every point of view. Abu Hanifah, all the while, sat quietly listening to the discussion. When it was his turn to speak, there was such a silence in the house, as if there was none other present.”⁶⁴ “Abd Allah bin Mubarak tells that once the discussion on an issue lasted three days. On the evening of the third day he heard cries of Allah-u Akbar (God is most Great) from within and understood that a solution had been achieved.”⁶⁵

It is recorded by another student, Abu ‘Abd Allah, that when Abu Hanifah had his views recorded on an issue, he had them afterwards read out to him to ensure their correctness. His own words are, “I read out the Imam’s words to him. Abu Yusuf (in recording the proceedings) used to record his own views, too, therein. Hence, I tried to read out the Imam’s words only, leaving out those of Abu Yusuf. Once I made a slip and read the other view, also. The Imam at once cut in, ‘Whose view is this second?’”⁶⁶

Another thing that we gather from al-Makki is that the work of classification of this council’s decisions under different heads and chapters also was completed in the life-time of Abu Hanifah. He says, “Abu Hanifah is the first man to gather the knowledge of the Shari‘ah (Islamic Law). None before him had done this work - Abu Hanifah compiled it in books, under different heads and chapters.”⁶⁷

This council recorded decisions on about 83,000 legal issues. These embraced not only those questions with which the public or the state was currently or had formerly been confronted but also others that might arise in the future. Possibilities were conceived and discussed freely to ensure that if ever they turned into actualities there should be laws ready to meet them. They related to almost all branches of law, internal (covered under the term *al-siyar*),⁶⁸ constitutional, civil, criminal, of evidence, of procedure, laws governing different aspects of economic life, marriage, divorce, and inheritance, personal, and aspects of economic life, and those dealing with worship. We can find all these subject-heads among the contents of books

compiled by Abu Yusuf and later by Mohammad bin Hassan al-Shaibani from the material provided by the deliberations of this “legislative council.”

This regular codification of law soon deprived individuals of the confidence they enjoyed in its absences in their efforts at law-making. The opinions and verdicts of scattered individuals, be they doctors or judges of repute, could not carry weight before the wholesomely judicious and precise decisions arrived at in council of legists presided over and guided by a man of Abu Hanifah’s foresight and calibre, after thorough sifting of the Qur’anic injunctions and the Prophet’s Tradition and keeping in view of precedents and the verdicts of the scholars of old, drawn as they were with thoughtful and steady labour, bearing in mind the principles of ijtihad (deducing conclusions with thorough discretion) in the light of the Shari‘ah, embracing all aspects of life, and able to meet all exigencies. Therefore, as soon as it came to light, the common people, the rulers, the judges, all felt forced to turn to it. It answered the demand of the day. As a matter of fact, it was the long awaited help which everybody had been seeking.

The famous legist Yahya bin Adam (d. 203/818) tells that the opinions of other jurists paled into insignificance before those of Abu Hanifah, his ideas spread everywhere, the judges, rulers, and officers of every place decided their cases in accordance with his law; in short, everything went according to it.⁶⁹ By the time of al-Mamun (198 - 218/813 - 833) it had acquired such popularity that one day Premier Fadl bin Sahl was advised by a jurist who was hostile towards Abu Hanifah, to issue orders to stop the use of Abu Hanifah’s code. Fadl invited the wise and prudent man to advise him on this. They told him not to take this step for it would not succeed. On the other hand, the whole country, they said, would turn against the Government, adding that the man who had given him the counsel was surely a fool. The Premier agreed with them, saying that he himself did not see any wisdom in the course, nor was the Caliph likely to agree to it.⁷⁰

Thus came about the historical reality that a system of law was devised by a private legislative council became the law of countries and empires on the strength of its merits and the moral prestige of those who framed it. It had also another important consequence in that it opened up for Muslim thinkers’ new lines for codification of Islamic Law. The chief legal systems devised later may have differed from it in their methods of deduction and in their results, but they were all inspired by and based on this model.

B. Abu Yusuf

In Abu Hanifah’s lifetime, the relations between the Hanafi School of Law and the ‘Abbasid rulers were strained, owing to his political creed and non-co-operation with the Government. The effect of this lasted for a long while after his death. The leaders of this school stuck to their policy of indifference towards authority. Thus, when after the death of Abu Hanifah, his great student Zufar bin Hadhail (d. 158/775) was asked to accept the post of a judge, he flatly refused it and fled to find safety in concealment.⁷¹ On the Government’s side, was also the tendency from the days of Mansur to the early years of Harun’s reign was to resist the influence of this school of thought.

Mansur and his successors earnestly desired that the gap in the legal system of the State, detailed in our previous discussion, should be filled by some other system of codification. Both Mansur and Mahdi in their respective reigns endeavoured to bring Malik to the fore.⁷² Harun also in 174/791, on the occasion of the pilgrimage, expressed his desire to make his book al-Muwatta' the law of the land.⁷³ At long last, a man of great strength and character belonging to the Hanafi School of Thought rose to bring this state of affairs to an end. With his great ability and personal influence he delivered the Empire from a continued state of legal chaos. The Hanafi code was made the law of the land which gave the whole Empire a uniform system of law. This man was Abu Yusuf, the ablest of the disciples of Abu Hanifah.

Brief Life Sketch

Abu Yusuf's (b. 113/731) personal name was Ya'qub. His father came from an Arab tribe of Bajilah, his mother of the Ansars of Medina with whom his father was also connected by ties of alliance; hence his family was known as Ansar. He chose to specialize in law after completing his elementary education and took his lessons from 'Abd al-Rahman bin Abi Laila.

Then he joined the school of Abu Hanifah and became permanently attached to him. His parents were extremely poor and did not want their son to continue his education. When Abu Hanifah came to know of it, he undertook to defray all the expenses not of the boy alone, but of the whole family. He himself said that Abu Hanifah never gave him occasion to express his want before him. On and off, he would send so much money to his family as would relieve him of worry on that account.⁷⁴

From the beginning, Abu Hanifah was very optimistic about his ward. When his father wanted to withdraw him from the school, the Imam told him not to do so, for, if it pleased God, the lad promised to turn out to be a great man.⁷⁵

Apart from Abu Hanifah, Abu Yusuf learned a good deal from other famous scholars of the day and made himself well acquainted with Tradition, Qur'anic commentary, biography of the Prophet, history, language, literature, and scholastic theology. Particularly well versed in traditions, he knew them by heart, and men like Yahya bin Mu'in, Ahmad bin Hanbal, and 'Ali bin al-Madini declared him thiqah⁷⁶ (dependable - a particular term used for a person of known veracity on whom reliance is placed in the transmission of traditions). His contemporaries all agreed that he was the outstanding among the disciples of Abu Hanifah.

Talhah bin Mohammad says, he was the greatest jurist of his age, none excelled him.⁷⁷ Dawud bin Rashid thinks that it would have been enough source of pride for Abu Hanifah if he had produced only this one disciple.⁷⁸ Abu Hanifah himself had great respect for him. He used to say that all of all his students the most acquisitive and adorned with learning was Abu Yusuf.⁷⁹ Once he was very ill and little hope was left of his life. Abu Hanifah, when coming out of the house after inquiring after his health, deplored that if the youth died he (Abu Hanifah) would not leave behind him a scholar more learned than himself.⁸⁰

For ¹⁶ years after the death of Abu Hanifah, he, too, in keeping with traditions of his school, remained indifferent to the Government. Nevertheless, he continued the intellectual and educative work of his master, adding to it the compilation of several books on almost all branches of law, and recording the decisions of Abu Hanifah's times supplemented with his own opinions.⁸¹

When these books spread throughout the country, they not only influenced the intellectual circles, but also impressed the courts and high officials connected with various government departments in favour of the Hanafi School of Thought, since there existed no other classified code of law to satisfy their wants as these books did. Malik's al-Muwatta' had come into the field long before, but it was not sufficiently comprehensive and elaborately classified to meet the needs of a government.⁸² Thus, Abu Yusuf's intellectual and literary work took hold of the minds of people before he came to power. It lacked only formal political sanction to enforce it as the law of the land.

Had Abu Yusuf's position been economically sound, he might have followed in the footsteps of his master and lived in continued indifference towards the Government. But he was a poor man and Abu Hanifah's death had robbed him of his generous support. Reduced by poverty to live a miserable existence, he was obliged one day to sell off a girder of his wife's house, for which he was reproached by his mother-in-law in a manner he could not endure, and this forced him to look for employment. He made for Baghdad and arrived there in 166/782, saw the Caliph al-Mahdi who appointed him the judge of eastern Baghdad, an office he continued to hold until the end of al-Hadi's reign.

When Harun al-Rashid became Caliph Abu Yusuf steadily gained such influence that he at last appointed him Chief Justice of the whole 'Abbasid Empire. This was the first occasion that such a post was created in the Muslim State. None before Abu Yusuf had held the post of Chief Justice of the State in either the "Right-guided" Caliphate or the Umayyad and 'Abbasid rule.⁸³ His position was not only that of the head of the Supreme Court of the realm, as we may conceive from the practice of our modern institutions, it also invested him with the authority of the Minister of Law, that is to say, he did not merely have to judge cases and appoint judges for the lower courts, he had also to advise the Government on all legal matters, internal as external.

Abu Yusuf's appointment to this office bore three far-reaching results. In the first place, instead of a college where he lectured students, or a study from which he issued books, a vast field of work now engaged his attention - a field in which he dealt practically with the affairs of the biggest empire of the day. This provided him with opportunities of applying the Hanafi law to the actual affairs of life, thus making it, in fact, a practical system of law. Secondly, as the appointment and removal of judges was now entrusted to his charge, scholars connected with the Hanafi School were appointed judges in most of the places, and through them the Hanafi law automatically became the law of the realm. Thirdly, with the help of his great moral and intellectual influence he converted the Muslim State, which had assumed an

autocratic character since the time of the Umayyads and was going, in a way without a constitution, into a State guided to a large extent by the constitution. Nay, he actually wrote a book of constitution for it, which has luckily come down to us intact in the shape of Kitab al-Kharuj.

Before we speak of this work on constitution, it is necessary to remove a widespread misunderstanding. Abu Yusuf's biographers have described such stories about him as often present him as the reader as one given to flattery and skilled wresting the law to suit the desires of Kings. But if we make the events recorded in history relating to Abu Yusuf's attitude to the Caliphs and their ministers and generals, it becomes impossible for us to believe that a mere flatterer could dare have it. In Hadi's time, when he was the judge of eastern Baghdad, he decided a case against the Caliph himself.⁸⁴

In Harun's time an old Christian filed a suit for a garden against the Caliph. Abu Yusuf not only heard the case, both confronting each other, but also asked the Caliph to deny on oath that he refused to accept the claimant's title to it. Even after this he was sorry for the rest of his life why he did not make the Caliph stand side by side with the suitor.⁸⁵ He declared 'Ali bin 'Isa, Prime Minister of Harun al-Rashid, an unreliable witness because, he said, he had heard him call himself the Caliph's slave. "If he is a slave in fact," he contended, his witness cannot be accepted. If he is not and calls himself so for flatter, he is a liar and cannot be trusted."⁸⁶ The same punishment he gave to a general of Harun's forces.⁸⁷

'Abd Allah bin Mubarak states that he used to go to Harun's palace riding right up to the private enclosures (where even the Premier must go on foot) and the Caliph was always the first to greet him.⁸⁸ Harun was once asked why he had raised Abu Yusuf so high. He replied, "In whatever branch of knowledge I tried him I found him perfect. Besides, he is upright and a man of solid character. If there is another like him I would be please to see him."⁸⁹

When he died (182/798) Harun himself accompanied the funeral procession on foot, led the funeral prayer, buried him in his own family graveyard and said it was a bereavement on which all the believers should condole with one another.⁹⁰ But nothing bears out all that has been said above so well as his work Kitab al-Kharaj. A perusal of its introduction alone will tell that it is just beyond an adulator to say such things as he did while addressing a king.

Kitab al-Kharaj

In Harun al-Rashid, Abu Yusuf found a king of the most conflicting disposition and humours, at once a fierce soldier, a luxurious monarch, and a God-fearing man. Abu al-Faraj Asbahani describes him in a sentence, "He would most easily melt into tears in response to an exhortation or admonition, but would be most unrelentingly cruel in response to something that kindled his wrath."⁹¹

Abu Yusuf, prudently avoiding to touch upon the Caliph's failings, skilfully set to work on his religious sentiment bringing to bear his great moral and intellectual influence to the task, and pursued this steadily until the Caliph's heart was won and he proposed for him the assignment of

preparing a constitution for him according to which he should guide the affairs of the State. This was how Kitab al-Kharaj came to be written.

The name of the book misleads one into thinking that its scope is limited to matters of revenue only. As a matter of fact, it deals with almost all the affairs of the State. Leaving aside all other details, we shall here examine its contents with only a view to seeing its basic conception of the Islamic State and its constitutional character.

Reversion to the “Right-guided” Caliphate

The first thing that strikes the reader who follows Kitab al-Kharaj closely is that Abu Yusuf desires the Caliph to give the Byzantine and Iranian traditions followed by the Umayyad and ‘Abbasid kings and revert faithfully to the traditions of the “Right-guided Caliphs. Although he has not directly asked him to give up following his forefathers, yet he has never lapsed even into quoting the conduct or the decisions of the Caliph’s forefathers as precedents worth following, much less those of his Umayyad predecessors. In every matter he bases his argument, either directly on the Qur’an or the Sunnah or else quotes precedents from Abu Bakr, ‘Umar, ‘Uthman and ‘Ali.

If he has ever quoted a precedent from a later period it is not from Mansur’s or Mahdi’s but from that of the Umayyad Caliph ‘Umar bin Abd al-Aziz. In preparing this book, he completely ignored the conventions and precedents of the whole 132 years of Umayyad and ‘Abbasid reigns, except those of the two and half years of ‘Umar II’s reign. Abu Yusuf’s work may not have meant much, had it been done by some ingenious lawyer in his private capacity as a holy sermon for those who might like to follow it. But done as it was by the Chief Justice-cum-Law Minister of the State in his official capacity, at the express instance and request of the Caliph, it becomes something extra-ordinarily significant.

At the beginning of the book Abu Yusuf lays down the basic conception of the State before the Caliph in these words, “Oh Commander of Believers, God, the sole deserver of praise, has placed on you a heavy responsibility which carries with it a great reward and a great punishment. He has committed to your charge the affairs of this community, so that yours is the duty to work for a large number of people day and night. He has appointed you a guard over them, given you their trust, and tried you by them, for you are to conduct their affairs for them. An edifice founded on anything except fear of God does not take long to crumble. God shakes it to the foundation and makes it fall on its builders, and on them that helped in its construction... Kings will be called to account by God as a shepherd is called to account by the owner of the flock... Take not the crooked path, lest your flock should follow in your footsteps... Treat everybody alike in the Law of God, whether one is akin to you or not... Go not into the presence of God as one who has been committing excesses, for the Ruler of the Day of Retribution will judge men by their actions, and not by ranks. Guard against wasting the flock entrusted to your care, lest the owner of the flock take you to task for every little sheep of it.”⁹²

After this he continues to press it on the Caliph everywhere in the book that he is not the owner of his kingdom but the Owner’s Caliph (lit.

deputy),⁹³ and that if he proved a just ruler he would see the best imaginable end, but if he proved unjust he would meet the worst punishment.⁹⁴ At one place he puts before him the words of ‘Umar wherein he says, “None who enjoys the right of commanding obedience has risen so high as to ask anyone to obey him in disobedience of God.”⁹⁵

Spirit of Democracy

Abu Yusuf conceives the Caliph to be answerable not only to God but also to the public, and has quoted at several places from the sayings of the Prophet and the Companions to prove that the Muslims have an unquestionable right to criticize their rulers and that such criticism contributes to the good of the people and the State.⁹⁶ “Enjoining the right and forbidding the wrong is an inalienable right and a duty and its negligence in a community is equivalent to inviting the wrath of God upon its head.”⁹⁷ It is the duty of rulers to have forbearance for truth being spoken before them, as nothing is more hurtful in a ruler than this being short-tempered and intolerant of criticism,⁹⁸ and the Muslims have a right to call him to account in respect of their lawful rights on him and of their properties that have been entrusted to his care.⁹⁹

Duties of the Caliph

The following duties of the Caliph have been specifically mentioned: To establish the rights of God and enforce the limits prescribed by him, to determine correctly the rights of other right holders and ensure their enjoyment of their rights, to revive the conventions of virtuous rulers (that have been discarded by the wicked rulers of late),¹⁰⁰ to check injustice and redress the grievances of people after proper scrutiny,¹⁰¹ in pursuance of orders of God, to command people to obey Him and stay away from the commission of sin, to apply the Law of God on himself and others alike, without regard to who suffers by it,¹⁰² and to make only lawful exactions from people and expend them in lawful ways.¹⁰³

Duties of Muslim Citizens

As opposed to these, the duties of the Muslims toward their rulers, as described in this book, are the following: They have to obey them, not to commit acts of disobedience, not lift arms against them, nor reproach them (unnecessarily), nor deceive them. They have to put up with excesses, to be sincerely helpful to them, to try to check them from wrong things and to cooperate with them in all that is good.¹⁰⁴

The Exchequer

He calls the exchequer a trust of God and the people instead of its being the Caliph’s property. Off and on he reminds the Caliph of the words of ‘Umar wherein he compares the Caliph’s position in relation to the orphan’s property, and states that if he is well-to-do, he should not take anything from it, in deference to the advice of God, and manage it for Him without any consideration, and if he is needy, he may take from it an amount which everybody will recognize as just and proper.¹⁰⁵

He also draws his attention to ‘Umar’s example in spending from the exchequer more sparingly than one would from one’s private purse. He

illustrates his point by reference to another instance where ‘Umar, appointing a judge, a governor, and a revenue officer for Kufah, allowed them to take a goat everyday for the expense of their board, adding at the same time that a land from which the officers will pick up a goat everyday would soon be impoverished.¹⁰⁶ The Caliph is also asked to forbid his officials to spend public money for their private needs.¹⁰⁷

Principles of Taxation

Abu Yusuf prescribes the following principles of taxation: Only the surplus wealth of people should be taxed and the burden of taxes should fall upon the people with their consent. The tax should vary according to the capacity of the tax-payer. Nobody should be taxed more than they can pay. The tax should be collected from the wealthy and spent on the poor.¹⁰⁸ Rates of tax should not be fixed so as to suck the blood of the people, nor should the tax be realized by coercive methods.¹⁰⁹ Government should refrain from extorting taxes which are not warranted and also forbid its officers and landlords to make such exactions.¹¹⁰ Non-Muslims who accept Islam should not be charged poll-tax.¹¹¹

The practice of the “Right-guided” Caliphs is quoted as authority in this connection. He refers, for example, to the incident related to ‘Ali that while in public he advised his officials to realize every penny of revenue from the payers and not to be at all lenient to them in this matter, but calling them apart he instructed them to be careful not to beat anybody or make them stand in the sun or press them so hard that they should be obliged to sell their cattle or clothes or utensils to pay the tax.¹¹² Or the fact that ‘Umar used to examine thoroughly his revenue officers to satisfy himself that the farmers were not dealt with too harshly in the exaction of revenue, and when the collections actually came in, the representatives of the common people were summoned to bear witness that no Muslim or non-Muslim peasant was unjustly made to pay the tax.¹¹³

Rights of non-Muslim Subjects

With regard to the rights of non-Muslim subjects in the Islamic State, three principles are quoted again and again on the authority of ‘Umar:

1. Whatever agreement is made with them has to be faithfully observed.
2. The responsibility for the defence of the State does not lie on them, but on the Muslims alone.
3. They should not be burdened with excessive poll-tax and land revenue.¹¹⁴

Then it is said that the poor, the blind, the old, the recluse, workers at the houses of worship, women, and children are exempt from poll-tax, that there is no zakat (prescribed charity) chargeable on the wealth and cattle of non-Muslims, that none is allowed to resort to beating or inflicting other physical tortures on them for exacting the capitation, as the maximum punishment for its non-payment is only simple imprisonment. To realize more than the fixed amount from them is unlawful, and the poor and the cripple among them are to be supported from the State exchequer.¹¹⁵

Historical incidents are related to make the caliph see that it is for the good of the state to be kind and generous to the non-Muslim subjects. It

was, according to him, magnanimity of the Muslims that in the days of ‘Umar won for them the hearts of the Syrian Christians to such a degree that they loved them more than their co-religionists, the Romans.¹¹⁶

Land Settlement

Abu Yusuf disallows the feudal system that of settlement in which the government, in order to realize the revenue from the farmers appoints a person to over-lord them, allowing him to exact from them whatever he likes and as he likes so long as he guarantees the payment of government dues. He condemns it as a most tyrannous system that is bound to lead to the ruin of the country and vehemently advocates that it must be shunned at all costs.¹¹⁷

He also calls it unlawful for the government to appropriate somebody’s land and bestow it upon another. He says, “The Caliph is not authorized to dispossess any person, Muslim or non-Muslim, of anything that belongs to him unless a proved or valid right stands against him in law. To snatch from one to make over to another is like committing robbery for the sake of distributing alms.¹¹⁸ Gifts of land are allowed only if uncultivated, not owned, or not inherited pieces of land are distributed within reasonable measure for purposes of cultivation or as rewards for some real, useful social service. Such donations, too, are to be withdrawn if the donees fail to cultivate such land within three years.¹¹⁹

Redress of Wrong

After this he tells Harun al-Rashid that it is not lawful for him to appoint tyrants and corrupt people to office of State or to employ them as officers of departments or governors of districts. If he did so, he would surely share the retribution of the wrongs that they do.¹²⁰ He asks him again and again to employ honest, righteous, and God fearing people to state services.

He emphasizes that in addition to their efficiency the government should also satisfy itself with regard to the moral character of its servants, and constantly keep a watch on them through its intelligence department, and if they tend to be corrupt or fall into cruel or cunning ways the caliph should know of the conduct and call them to account.¹²¹

He also tells Harun that the Caliph should listen regularly to the grievances of the people himself, and that occurrence of injustice could be made to stop if he has open court even once a month, where every grieved person is allowed to put his grief before the caliph and the officers are made to realize that what they do may one day reach the Caliph’s ear.¹²²

The Judiciary

The judiciary, according to him is meant to dispense justice, pure and undiluted. To punish one who is not guilty or to let one who is guilty go unpunished are alike unpardonable. But not should be punished on doubt. To go wrong in forgiveness is better than going wrong in awarding punishment. There should be no interference in the course of justice, nor should anybody’s recommendation, position, or status count.¹²³

Personal Liberty

Abu Yusuf also maintains that nobody can be incarcerated on a mere accusation. The accused person must be given a regular trial, and witnesses examined. If he proves guilty, he may be imprisoned, otherwise, he should be set free. He advises the Caliph that the cases of those who lie in person should be examined and those that are found to have been put there without sufficient proof or witness should be released. For the future all the governors should be instructed not to imprison anybody on the basis of mere allegation or suspicion without giving him a fair trial.¹²⁴ He also holds that it is illegal to beat or flog an accused person. Every person's back is immune from punishment unless a court declares him worthy of the lash.¹²⁵

Jail Reforms

In the reforms that he has suggested for the improvement of prisons, he affirms that every prisoner has a right to receive his board and clothing from the Government Exchequer. He severely condemns the Umayyad and 'Abbasid practice of daily taking out the prisoners handcuffed and in chains to beg for their food and clothes. He requests the Caliph to put a stop to it and proposes that clothes suited to the season and sufficient food should be given to every prisoner by the Government.

The practice of burying the deceased heirless prisoners without wash and coffin, or without the funeral prayer, is also condemned in vigorous terms. "It is a matter of great shame for the Muslims," he says. The proper wrapping and burial of these prisoners should be a Government charge. He has also recommended that no prisoner except those guilty of murder should be kept in fetters inside the prison.¹²⁶

These are, in brief, the constitutional proposals which Abu Yusuf, as Law Minister and Chief Justice of the realm, placed before an autocrat 12 centuries ago. Placed beside the basic principles of an Islamic State and the traditions of the "Right-guided" caliphate, or compared with the teachings of his own master Abu Hanifah, they look far short of them indeed. There is no trace in them of the ideal way of choosing a Caliph. There is no mention of the advisory body, called the shura, guiding the administration of State affairs, nor of the idea that the wicked and the corrupt have no right to rule and if they come in, the public have a right to rise in revolt against them.

Not only that, many other important things also are missing and, judged from these and other such considerations, these proposals fall short of the true conception of an Islamic order. But this should not lead us to infer that Abu Yusuf's conception of the Islamic State was restricted to the limits of these proposals of Kitab al-Kharuj and that he did not want anything more than what he put down there.

On the contrary, what we find here describes what he, as a practical thinker, conceived as the maximum that was possible and worthy of achievement in the particular circumstances of that period of the 'Abbasid regime. In fact, the idea was not to present a theoretically perfect plan without regard to whether it was capable of being translated into practice or not. His intention was to draw up a constitutional plan which in addition to satisfying the minimum conditions required for the making of an Islamic State, should promise to be workable in the circumstances.

Bibliography

17. Before gaining currency as a term of the scholastics, the term Fiqh covered beliefs, general principles, law - in fact, everything under it. The differentiation was made by calling beliefs and general principles Fiqh al-Akbar, the fundamental or the main Fiqh, and Abu Hanifah gave the name to his compendium.

Recently, some scholars have doubted the authenticity of some parts of this book; they believe them to have been included later. However, the authenticity of those parts which we discuss here is undoubted, as whatever other sources we tap to collect Abu Hanifah's opinions on these matters, we find these tallying with them.

For instance, Abu Hanifah's al-Wasiyyah, al-Fiqu al-Absat reported by Abu Muti' al-Balkhi, and 'Aqidah Tahawiyyah in which Tahawi (c. 229 - 321/843 - 933) has described the doctrines reported from Abu Hanifah and his students, Abu Yusuf and Mohammad bin Hassan al-Shaibani.

68. People of the present day labour under the wrong impression that International Law is a thing of the modern times and its founder is Grotius of Holland (991 - 1055/1583 - 1645). But whoever has seen al-Siyar of Abu Hanifah's student Mohammad bin Hassan al-Shaibani (132 - 189/749 - 805) knows that the codification of this law was accomplished by Abu Hanifah 900 years before Grotius, and that if, on the one hand, his discussions hardly leave any aspect of it untouched; on the other, they encompass the finest and most vital issues., This has recently been acknowledged by a group of scholars and a Shaibani Society of International Law has been founded in Germany.

Chapter 35: Al-Farabi

A. Society And Its Goal

An account of the life and philosophical thought of Abu Nasr Mohammad ibn Tarkhan al-Farabi (d. 339/950) has already been given in a previous chapter. The reader must have noted that, while recasting the philosophical views of Plato, Aristotle, and other Greek thinkers, al-Farabi always keeps in view the Islamic tenets which have formed the inner links of his writings. In his political philosophy, he has followed the same line. Under the influence of Plato and Aristotle he evolves his own system which markedly differs from the system of the Greeks, the Iranians, as well as the Indians.

This will be shown in these pages which have been prepared in the light of 1) Kitab Ara' Ahal al-Madinat al-Fadilah (Book on the Views of the People of the Excellent State), 2) Kitab al-Siyasat al-Madaniyyah (Book on Caution on the Path of Administration), 3) Kitab Tahsil al-Sa'adah (Book on the Achievement of Happiness), 4) Kitab al-Tanbih 'ala Sabil al-Sa'addah (Book on Caution on the path of Happiness), and 5) the Bodleian manuscript of his Fusul al-Madini (Chapters on the Civilian).

The City State

According to al-Farabi, the City State (Madinah) and the Family State are places that contain inhabitants, no matter whether their dwellings are constructed of wood, mud, wool or hair.¹

The house or family is limited to only four relationships: husband and wife, master and slave, father and son, and property and proprietor. He who makes them unite in co-operation and aims at providing for them an abode with the best facilities and maintenance, is called the master of the family. He is in the house what the administrator of the city is in the city.²

Necessity of Society

Men are naturally so constituted that they need many things for their best achievements. Hence, they need mutual help and co-operation - everyone doing his best for obtaining a particular kind of object. Thus, by uniting their individual efforts for different objects they organize different societies.³

The greater the society, the better are the facilities it achieves for its individuals. The grouping of men is not confined to a house. It extends to lanes, localities, villages, towns, and cities. Men work for the welfare of society and in the long run serve the State. The people living in a state are called a nation (Ummah). One nation can be distinguished from another by natural character, temperament, habits, and language.⁴

Human societies are either perfect or imperfect. The perfect society may be great, middling, or small. The great human society is the one consisting of several nations uniting themselves in one unity and helping one another. The middling one is the society of one nation in a part of the world, and the small is the society of the people of a city.⁵

The imperfect society is that of the people of a village, a locality, a lane, or a house, the last being the smallest.

Now, the highest good and perfection are primarily achieved through volition and will. Similarly, evil finds its scope by volition and will. The City-State can, therefore, develop by mutual help and efforts to attain some evil purpose or to attain happiness. The city in which the members of the society co-operate to attain happiness is in reality the ideal City-State (al-madinat al-fadilah), the society, the ideal society, and the nation.⁶ In this State the citizens help one another to achieve qualities of the greatest life perpetually.⁷ But if they help one another to obtain the bare necessities of life and its preservation, this City-State is evidently the necessary State.⁸

How to Achieve Happiness

Al-Farabi speaks of happiness both of this world and hereafter. He explains that when human factors or the four excellences - speculative virtues (al-jada'il al-nazariyyah), theoretical virtues (jada'il al-fikriyyah), the moral virtues (fada'il al-khuluqiyyah), and the practical arts (al-sana'at al-'amaliyyah) - form the qualities of a nation or of the people of a city, their worldly happiness in this life and the lasting happiness in the next are insured.

Speculative virtues (al-fuda'il al-nazariyyah) represent those sciences which aim at the highest object, knowledge of existing things including all their requirements. These sciences are either innate in man, or they are achieved by effort and learning.⁹

Now, the principal factors of existing bodies and accidents, as explained by al-Farabi, are of six kinds with six grades: The first cause in the first grade, the secondary causes in the second grade, active intellect in the third grade, soul in the fourth grade, form in the fifth grade, and matter in the sixth grade. The first grade is confined to one individual only; it cannot have more than one. But other grades can have more than one occupant. Out of this six, three, viz. the first cause, the secondary cause, and the active intellect, are neither bodies nor are they contained in bodies. The other three: soul, form and matter are not bodies, but exist in bodies.

As for bodies, they are of six types: the heavenly bodies, rational animals, irrational animals, plants, minerals and the four elements. All these six bodies as a whole form the universe. The first to be believed in is God, the Almighty, who is the immediate cause of the existence of the secondary causes and the active intellect. The secondary causes are the causes of the existence of heavenly bodies and their substance. The secondary causes should be called the spirits, the angels, and so on.

The function of the active intellect is to attend the rational animal, man, and to enable him to attain the highest perfection he can reach. The highest perfect of man consists in his highest happiness which he achieves when he raises himself to the stage of the active intellect by abstracting himself from bodies, matter, and accidents, and continues to enjoy this perfection perpetually. In essence, the active intellect is one but in gradation it includes all that is purified from the rational animal and attains to happiness. The active intellect should be called the Holy Spirit (al-ruh al-Amin or al-Ruh al-Qudus) or the like and its grades be called the spiritual realm (al-malakut) or the like.

Souls have three grades: souls of celestial bodies, souls of the rational animal, and souls of the irrational animals. The souls of the rational animal are the rational faculty, the appetitive faculty, the imaginative faculty, and the perceiving faculty. The rational faculty equips man with sciences and arts, and enables him to distinguish good from evil manners and actions. Through this faculty man inclines to do good and avoid evil and realizes the useful, the harmful, the pleasant and the unpleasant.¹⁰

1) The rational faculty is either speculative or practical; the first is that through which man obtains the knowledge of all that he is not at all supposed to know by his own effort, and the second is that through which he knows all that he can know if he wills it so. The second is again divided into that through which arts and crafts are obtained (mahaniyyah), and that through which imagination and insight concerning doing or not doing a thing are achieved (marwiyyah).

2) The appetitive faculty manifests the human inclination of wanting something or running away from something, of desiring or not desiring something, of giving preference to something or avoiding something. All psychological feelings - hatred, affection, love, friendship, enmity, fear, anger, passion, mercy, etc. - are expressed by this faculty.

3) The faculty of imagination retains the impression of the sensible objects after they have disappeared from sense-perception, unites some of them with some others, or separates some of them from some others both in wakefulness and sleep producing true or false propositions. This faculty also perceives the useful, harmful, pleasant, and unpleasant manners and action.

4) The faculty of sense-perception obviously perceives the sensible through the five sense-organs - the pleasant and the unpleasant, without discriminating between the harmful and the useful, and without distinguishing good from evil.

The three faculties other than the rational faculty are available to animals, imaginative faculty serving them as the rational faculty serves man. Some animals, however, possess only the sensible and the appetitive faculties.

The celestial souls are different from the animal souls in so far as the former are actual souls that understand the intelligible, whereas the latter are at first potential and then become actual.¹¹

Having explained the gradation of cosmos and the relation that the different grades have with the First, al-Farabi emphasizes the point that the whole cosmos depends for its existence on God, the First Necessary Being.

Man, however, understands and realizes happiness only through the speculative rational faculty. The imaginative and the sensitive faculties help the rational faculty in moving man towards those actions which lead to happiness. The good is characterized as "voluntary." But if the rational faculty feels happiness only by making an effort to perceive it, while other faculties do not perceive it, then sometimes man considers the pleasant and the useful to the ultimate ends of life.

Again, when one becomes indifferent or slow in accomplishing the sensitive rational part and does not feel happiness in doing so, one hastens to attain to it by exercising one's appetitive faculty in aiming at and making all effort to achieve things other than happiness, and in this effort one is

assisted also by the faculties of imagination and sense-perception, and produces what may be rightly called voluntary evil.

Similarly, he produces only evil who attains to happiness which he does not recognize as his aim, does not desire it, or desires it with the faint desire, and adopts something other than happiness at his end, and exerts all his faculties to achieve that end.¹²

Since man has been created to achieve happiness which is the highest perfection that remains perpetually, it is possible to obtain it through the active intellect which gives primarily the first intelligible or the first objects of knowledge. But men differ in their capacity to receive the primary intelligible.

B. Human Nature

Human nature is not the same in all individuals; it varies in accordance with the physical qualities of individuals. Some can easily grasp the first intelligible or the first known things, some do not receive them directly. Again, some of them do not receive anything from the first intelligible in a natural way at all, and some others receive them in a way different from theirs. There are still others who receive them in respect of their own selves.

Human beings in this third group are free from defect, their nature being homogeneous, prepared to receive intelligible which are common to them and through which they advance to the affairs and actions that are common to them. After this stage, they differ from one another, as some receive those intelligible which are peculiar to them, and are not common to others. Those belonging to this group endeavour towards a particular genus without allowing anything else to share it.

Similarly, human beings excel one another in the faculties through which they derive the objects of one genus, some having the ability of deriving all the individuals of a genus and others perceiving only a few individuals thereof. Again, sometimes it so happens that two individuals do not prove to be equal in their capacity of deriving the external objects, one being swift and the other slow, or one being swift in deriving the genus of the greatest excellence and the other in deriving the basest of the genus. It is also possible that both are equal in power, but one is able enough to teach what one has derived, and can offer guidance to others, but the other has no such power of teaching and guiding others. They also differ in performing corporeal deeds.

Natural dispositions do not oppose one another, nor do they insist on action, but they facilitate performance, and are not moved by anything external towards opposite actions. Even if they are moved in opposite directions they resist and offer hindrance.

All these natural dispositions require a suitable teacher. Hence, they are trained in matters that prepare them to be in their highest or nearly highest perfection. Some are trained in mean things which produce excellent actions from a mean genus.¹³

People have different calibres by nature, and they vary in ranks in accordance with the ranks in genus, arts, and sciences for which they have naturally been prepared. They also differ in the capacity of training and giving guidance. Some are stronger than others, and, hence, they differ in

receiving and training. For some can be trained for a part of the genus only. Now, he who is an expert in imparting training and guidance is called the chief.¹⁴

C. Education

Man has been created to attain to the highest happiness (sa'ddah). He should, therefore, know what happiness is and should make it the aim of his life. He, then, needs to know those factors and arts through which he can achieve happiness. He will have to exercise all those arts which will enable him to attain to it. But since it has been explained that human individuals differ in nature, it is not in the nature of every man to know happiness or those factors which enable him to reach it by himself. He, therefore, needs a teacher, a guide.

Some people require less guidance and teaching, and some need more. It is also not necessary that one should learn all that one is taught, or receive all the guidance one is given. Hence, some people require constant teaching and guidance to urge them to do what they have been taught to do.¹⁵

Teaching (ta'lim) means creating speculative excellences in nations and cities, while upbringing (tadib) is the method of creating and developing moral virtues and scientific arts in nations. Teaching is possible only by expressing; tadib or discipline is to make nations and citizens habituated to the deeds done through scientific habits. That is, their resolutions will move them to perform those actions, so much so that these resolutions will dominate their souls, and they will become devoted to those actions.

To exert one's resolution to do something is possible either by expression or by performance. While al-Farabi agrees with Plato in the system of education and in learning from childhood, he emphasizes that speculative sciences are learned either by kings and leaders (imams) or by those who preserve these sciences and teach kings and leaders in several ways. First of all, they should know the primary axioms, and the first known object in every genus of speculative sciences, and then they should know the various forms of premises and their arrangement through which they can lead to conclusions. After they have completed their education, and have accustomed themselves to logical methods, they will be made kings in each of the partial States, and will be promoted little by little until the stage of the great State is achieved.

Speculative sciences must be taught through convincing methods. Men very often understand these sciences by a process of thinking, because they understand them after realizing many known principles which are not corporeal. The common people can understand their images by the method of convincing only.

The teacher should also distinguish what should be imparted to a particular nation and how to make it common to all nations or to all the people of every city. He should also know what should be taught to the entire nation, or city, and what only to a particular group in the city. All these distinctions can be made by the imaginative virtue which enables one to achieve the speculative virtues.

As for practical virtues and practical arts, people must habituate themselves to practising them by two methods. First, the teacher should

train them by convincing and effective expressions to engender the values of these actions and habits perfectly in their hearts so that their convictions may move them to perform them submissively. Secondly, he should use the method of force which is employed for the disobedient and revolutionary citizens, and those who do not move to righteousness meekly on their own accord or by persuasion.¹⁶

The virtuous teachers and artists can be divided into two groups in respect of the above-mentioned two methods - one group teaching and training those who are obedient, the other group teaching the disobedient. In both respects, the king is the teacher of nations whom he trains to achieve virtues, and the master of the house is the teacher of the people of the house. Similar is the case with one who is in charge of children or the youth.¹⁷

The Imaginative Virtue

The imaginative virtue enables a man to think of an exceedingly useful purpose which is common to the comity of nations, to a nation, or to a city. This virtue is called the civil imaginative virtue. But if this virtue is common to a group of citizens or the members of a house only, then it is ascribed to that particular group and is called family imaginative virtue, or State imaginative virtue. Sometimes this virtue is further divided. Since it is derived from what is most useful and beautiful in respect of a particular art or profession for a limited time, it is divided into the various kinds of arts and professions. The most accomplished one in this virtue is the strongest one who succeeds in creating a great State.

The imaginative virtue confined to different aspects of the State - defence, finance, and so on - is followed by moral virtue which is related to the imaginative virtue as the imaginative virtue is related to different arts, professions, or families. This virtue is, first of all, needed for organizing and maintaining the army. The moral virtue alone impels the warriors to display their bravery, and the best kind of valour. It also urges citizens to earn the wealth of the State with honesty and legal means. In fact, it plays a major role in all departments of the State.¹⁸

D. The Chief

It is evident that every man cannot be the chief. People differ in their intellectual capacity, in physical strength, in the exercise of virtuous deeds, and in the acquisition of excellent habits of thinking, feeling, willing, and doing. In every department of life and arts the strongest person, of excellent manners, who also knows, acts, and directs, is the chief of that department, the rest being the subjects. The chief is either one of the first rank who is not sub-servient to anyone, or he is of the second rank, dominating some, and being dominated by some others. Such ranks develop in relation to the forms of art, e.g. cultivation, trade, medical profession, or in respect of all kinds of human beings.¹⁹

The first chief in general is he who needs no help from anyone. Sciences and arts are his property in actuality, and he needs no guidance from any person in any respect.²⁰

The first chief of the excellent (ideal) city is one who is chief in all respects. His profession must excel all the rest in attaining to perfection, and

in intending by all actions of the ideal state to achieve the highest happiness. This man is not sub-servient to any other. He is a man accomplished in all virtues, and, therefore, he is intellect and intelligible in actuality, having his imaginative faculty naturally so perfected as to be able to receive particulars from the active intellect either in themselves, or as images in sleep, or in wakeful state. His passive intellect receives the intelligible in complete perfection, so that nothing which has become an intellect in actuality is denied to him.

Whosoever invests his passive intellect with intelligibles becomes intellect and intelligible in actuality. His understanding of himself is more perfect, more separable from matter, nearer to the active intellect, and is called the derived intellect. This derived intellect has a rank between the passive and the active intellect. The passive intellect is, therefore, like matter and sub-stratum for the derived intellect which is like matter and sub-stratum for the active intellect.²¹

The rational faculty²² which is the natural form, supplies material sub-stratum for the passive intellect and makes it the actual intellect. The actual intellect is the first stage at which man is called man and being human becomes common to all human beings. When the passive intellect and the natural form become one in the same way as the composite of matter and form becomes one and the same thing, and man receives human form, the actual intellect is achieved; and when the natural form becomes the matter of the passive intellect which has thus becomes the actual intellect, it becomes the matter of the derived intellect, which in its turn becomes the matter of the active intellect, and all of these become like one thing, then man enjoys the presence of the active intellect in himself.

If the active intellect is present in both parts of the rational faculty - the speculative and the practical - then man receives revelation in his imaginative faculty. Allah, the Exalted and Sublime, sends revelation to him through the active intellect. If the active intellect extends what it receives from Allah to his passive intellect through his derived intellect and then to his imaginative faculty, then man, through what descends upon his passive intellect, becomes a wise philosopher and possessor of perfect understanding, and through what descends upon his imaginative faculty, a prophet, a warner against what is going to take place, and an informer of what particulars exist, as he understands them for God. This man is in the most perfect stage of humanity and in the highest place of blessing, his soul being perfect, united with the active intellect in the manner described. This the man who is aware of every action that would enable one to achieve grace and is the chief, the leader, who cannot be led by anybody else.

E. Characteristics Of The Chief Of The Ideal State

The Imam or the chief of the ideal State is the chief of the ideal nation, and for the matter of that, of the whole inhabited part of the earth. This position is only attained by a man who naturally possesses the following 12 characteristics as his second nature:

1. Sound health, and perfect organs, performing their functions with ease and facility and in harmony will faculties.

2. Intelligence and sagacity, so as to be able to grasp the intention of a speaker in his particular situations and circumstances.

3. Good memory, so as to retain in his mind all that he understands, sees, hears, and perceives.

4. Prudence and talent, to understand a problem from the perspective in which it has been presented to him.

5. Eloquence, so that his tongue may assist him in expressing in a perfect manner all that is in his mind.

6. Devotion to education and learning, and submission to receive knowledge with ease without feeling any annoyance.

7. No greed for food, drink and sex, avoidance of play, and dislike of pleasures caused by these.

8. Friendliness towards truth and truthful persons and condemnation of falsehood and those who are inclined to falsehood.

9. Bigness of heart, loving nobility, and natural magnanimity without any trace of meanness.

10. Indifference to dirham and dinar and other forms of wealth.

11. Devotion by nature to justice and just people, abhorrence of injustice and oppression and unjust and oppressive people, offering half of one's possessions and those of one's family to help the oppressed, and urging others to do the same, helping everything good and beautiful, and being easy to bend to justice but difficult to oppression and evil.

12. Strong resolution, courage, and promptitude without any sign of fear or psychological weakness.

If a person possessed of these qualities happens to live in an ideal State he is the chief.

It is, however, impossible to have all these qualities in one man. People are scarcely equipped with all of them. If no one having these qualities is found in the State, the laws promulgated by the former chief or his successors should be kept in force.

The second chief who succeeds the first should fulfil at least the following six requirements:

1. He should be wise and philosophical.

2. Learned and abreast with the laws, customs, rites and rituals adopted by his predecessor to discharge the function of the ideal State with all perfection.

3. He should be an expert in deriving principles in case he does not find any law.

4. He should be far-sighted, possessing an insight to frame rules and regulations in accordance with the conditions and circumstances he finds himself in, and capable of keeping up the reforms he introduces.

5. He should also be well experienced and eloquent in giving directions to urge the people to follow him in accordance with the Shari'ah.

6. In addition, he should be skilful in physical display of exercises needed in warfare, and in the use of arms, ammunition, and other equipments.

In other words, this ruler must have insight to derive inferences from the possessed records of the customs, rites, and rituals, and accurate opinion in

understanding the events that take place and may increase the prosperity of the State. He must have the power to convince others and struggle hard. This sovereign is called the king of the tradition, and the State is called al-mulk al-sunnah the country of traditions and customs.

If all the conditions described for the chief are not found in one man, and are available in two persons - one wise and the other possessing other qualities - then both will be the chiefs of the State. If, however, these conditions are scattered in a group of people agreeable to work together, then these members will be the ideal chiefs. But if wisdom does not form a part of the State while other conditions are fulfilled entirely, the city will be best without a sovereign, but it will be exposed to destruction. The State without a philosopher to whom it may be entrusted will perish in no time.²³

F. The Ideal State

The sovereigns of an ideal State who succeed one another are all like one soul, as if there were one king who continued all the time. Similar is the case with a group of people who administer the State together at a time in one or more than one city. The whole group is just like one sovereign, their souls being like one soul. Uniformity is found in every stage and in every part of the State, and people flourishing at different times look as they were one soul working at all times in the same way. If there is continuity and harmony at a particular stage, even different groups of people, whether of one or more than one State, would appear as one soul.²⁴

The people of the ideal State have something common to all of them in their learning and acting, but different groups of people belonging to different ranks and stages have some sciences and deeds peculiar to them. Through both of these, people achieve happiness, and by displaying these they obtain an ideal physical form. This form grows stronger and stronger and better and better by constant performance of those deeds. For example, the art of writing has some pre-requisite performances. The more they are executed by the expert, the greater is the excellence of his art. Not only that, the scribe enjoys his art by repeating his exercises, and grows in love for it.

The same is the case with happiness, which increases with the constant practice of deeds that lead to it. The soul grows in happiness to such a degree that it becomes free from matter. It does not perish with matter, for it is no longer required for its existence. At this stage, being separated from matter, the soul frees itself from all corporeal qualities so much so that even movement and rest cannot be ascribed to it. As this state is very unusual, it is very difficult to form an idea of it.

G. Arts And Blessings

As art has three grades, happiness or bliss is also divided into three grades in respect of species, quality, and quantity. There are such species of art as weaving, cloth-trading, perfumery, and sweeping, or as dancing, jurisprudence, philosophy, and rhetoric. Thus, arts excel one another in different species.

The artists of the same art excel one another in skill and efficiency. Two scribes, for example, differ in their skill, because, besides a good hand, their art requires some knowledge of lexicon, rhetoric, and arithmetic. Now, one

may be an expert in good hand and rhetoric, another in good hand, lexicon, and rhetoric, and yet another in all the four arts. Again, two scribes may differ in the quality of their art, for one of them maybe better than the other. Similarly, happiness excels in species, quantity, and quality.

The people of an imperfect State have but little virtue. They have evil psychical forms and their actions are not good. The greater their activity, the more does their profession display defect and imperfection. In consequence, they become ill inasmuch as they do not enjoy edibles, and become annoyed with beautiful and excellent things. Some of them even regard themselves as healthy and perfect, though they are actually not so, and do not pay any heed to the advice of the physician or the well-wisher.

H. Inhabitants Of The Ideal State

The excellent or the ideal State consists of five kinds of people: the excellent, the linguists, the secluded, the struggling, and the steady. The excellent people are the philosophers, the intellectuals, and “the People of Opinion” in great affairs. As for linguists, they are the orators, speakers, poets, musicians, writers, and the like. The secluded people are the mathematicians, statisticians, physicians, astronomers, and the like. The struggling people are the fighters, the defenders, and all those who take their place. The steady are those who earn money in the city, for example cultivators, traders, and those engaged in other pursuits.²⁵

I. Imperfect States

The excellent State as explained above is the State administered by the best and most talented who aim at prosperity and happiness for all and sundry. If its constitution fails to provide the people with prosperity, and the rulers do not possess the qualities of ideal rulers, then the State ceases to be excellent and is called the evil-doing State (al-madinat al-fasiqah), the ignorant state (al-madinat al-jahilah) or the astray going State (al-madinat al-dallah). People in the evil doing State are like weeds in a field. They are no better than savages and can have no organization worthy of a State.²⁶

As for the people of the ignorant State, they possess their own constitution and culture. But their civic organization varies. They look after the necessities of life in a necessary State; organize the society of the contemptible in the contemptible State, the society of the vile in the vile State, the society of the extravagant in the extravagant State, the society of the dominant in the dominant State, or the society of the free in the social State.

The necessary organization is the State which endeavours to earn what is evidently necessary for the constitution and the upkeep of the body.²⁷ The State of the contemptible is the one which tries to achieve wealth in abundance, and the money which they hoard due to the love of wealth and niggardliness is spent only for the needs of the body. The vile state broods over sensuous pleasures and achieves the best means for the sake of pleasure only. This State is the most coveted one.

The extravagant State is the organization of the profusely generous in which the individuals help one another to reach nobility in expression and action. The people of this State are called generous either by themselves or

by the people of other States.²⁸ This is the best State among all the States of the ignorant.

The state of the dominant people tries to over-power others in power and wealth; they shed blood, subjugate others, and indulge in all sorts of pleasures. The State of the dominant excels the State of the generous in showing power.²⁹ As for the social State, everybody is free in it to do whatever he likes, and believes that no man has any superiority over others by any means. But independence often leads to extremes, and, therefore, there arise in this State different rites and rituals, customs and manners, and people are misled by evil propensities. Thus, this State splits into different groups and parties.

In all these States there is always unrest prevailing among the people, as everybody tries to become the chief and, by virtue of his wits, to lead the State of prosperity and happiness.

The evil doing States differ from the States mentioned above in so far as the people of these States believe in the principles held and the forms of happiness conceived by the people of the excellent State, and also invite others to do the same, but they themselves do nothing to achieve their object, nor do they try by action to attain the happiness they believe in. On the contrary, they incline to their own whims and propensities, that is to say, they like to enjoy power, nobility, and domination, and direct their actions towards their achievement. In activities, these States are like the States of the ignorant. In manners, their peoples resemble the peoples of the said States. The peoples of these two States differ only in belief. None of these states ever achieve happiness and prosperity.

The astray going States are those whose people suffer from some delusion. They adopt such principles, actions, and deeds as appear to them to be those of the excellent State, but in fact are not. The same is true of their goal of happiness and prosperity which they conceive to be so but which actually is not so.

The offspring of societies which develop in these States are of various types and all of them aim at personal gain and victory and not at real happiness and true prosperity.³⁰

J. Conclusion

According to al-Farabi, the chief of the state should be physically free from all defects, and should have a sharp intellect, memory, and wit. He should be devoted to sciences, truth-loving, and not easily upset by difficulties, contented, without greed for things to eat, and disinclined towards sensuous pleasures. He should abhor falsehood and liars, be ambitious with lofty ideals, a lover of justice, without thought of wealth or worldly position, and should have strong resolution, boldness, and courage. Plato's philosopher king has also been described as truth loving, fond of the knowledge of existents, one who keeps away from vice, is free-thinking, intelligent, sagacious, witty, and ambitious. But the state of al-Farabi is international in character.

While the State of Plato is only a City-State, that of al-Farabi can be as vast as a World-State. Plato wants to entrust the affairs of the State to a group of philosophers and names the organization "aristocracy." Al-Farabi

not only calls the Head of State Imam but identifies him with prophet. It is in the absence of the Imam or the second chief who has the necessary qualities to follow the tradition of the Imam that he entrusts the affairs of the State of the chief. It is, therefore, not true to say that al-Farabi has based his theory entirely on the Republic of Plato, or that he is simply Aristotelian in his thought.

Chapter 36: Al-Mawardi

A. Life And Works

Abu al-Hassan al-Mawardi was born in Basrah (c. 364/974) which was then one of the principal seats of learning and education in the Muslim world. He, therefore, got all his education here and rose in literary renown at an early age. He especially prepared himself for the judicial profession and obtained an appointment in the State service. As a judge he served at various places and was finally posted in Baghdad. In the year 429/1037, the Caliph, al-Qadir, summoned four jurists representing the four schools of Islamic Law to write a legal epitome. Al-Mawardi was chosen to represent the Shafi'ite school and he wrote *Kitab al-Iqna'*; al-Quduri produced his famous *al-Mukhtasar* for the Hanafites. The other two books were of no importance.

The Caliph, however, recognized al-Mawardi's work as the best and in appreciation of his merit appointed him as the *Aqda al-Qudat*. This designation was objected to by many leading jurists like Abu al-Tayyib, al-Tabari, and al-Simyari, who said that it did not become anyone except God. But al-Mawardi took no notice of these objections and retained the designation until his death in 450/1058, because the same jurists had previously approved the title of *Malik al-Muluk al-A'zam* for Jalal al-Daulah, the Buwaihidi chief.

Although al-Mawardi was a staunch Sunnite and Shafi'ite jurist, he had the good fortune of being equally favoured by both the Buwaihids and 'Abbasids. But the Shi'ite Buwaihids favoured him out of diplomacy, because he was often helpful in settling their everyday quarrels with the palace, for, writes Yaqut, "He was held in great esteem by the Buwaihidi Sultans who deputed him to negotiate between them and their opponents, and were pleased with his mediation, and affirmed his settlements."

Al-Mawardi was acclaimed as one of the ablest men of his age. He was not only a distinguished judge but also a distinguished author. He wrote mostly on law and politics. His well-known extant works are: *Kitab al-Hawi*, *al-Iqna'*, *Siyasat al-Mulk*, *Qawanin al-Wizarah*, *Adab al-Dunya w-al-Din*, and *al-Ahkum al-Sultaniyyah*. But it is this last work on which his fame chiefly rests. In Muslim history it is one of the first scientific treatises on political science and State administration. A detailed discussion of this will be taken up in the following pages.

Here, a note of explanation seems to be necessary. Ibn Khallikan quotes a report that none of al-Mawardi's writings were published in his life-time because the author had grave doubts as to whether he was really honest and correct in his speculations. This report cannot be accepted as true, particularly with reference to *al-Ahkam al-Sultaniyyah*, because there exists another book with the same title by Abu Ya'la al-Farra', who was a contemporary of al-Mawardi and who died in 458/1066.

Abu Ya'la's book is almost an exact replica of al-Mawardi's work so far as its pattern and subjects of discussion are concerned. Even the language and arguments are almost the same as in al-Mawardi in most places. It is, therefore, certain that Abu Ya'la had seen the published work of al-Mawardi while the latter was still alive, because the dates of their deaths are so

approximate to each other and because it is not proven that Abu Ya'la had personal relations with al-Mawardi. This conclusion is further strengthened by the fact that Yaqut, who died in 626/1229, does not mention this story, and the authority of ibn Khallikan, who died in 681/1282, cannot be accepted in this matter.

B. Political Theory

Al- Mawardi's main political thought is embodied in his al-Ahkam al-Sultaniyyah. Only a small portion of the work is, however, devoted to political theory, the rest of it discusses the details of public administration and rules of government. But his small portion is extremely important because it is the first attempt in Muslim history to evolve a comprehensive theory of the State and because it has left an enduring influence on the course of Muslim political thought up to our own day.

Further, although we know that al-Mawardi profited a good deal from previous sources in the elaboration of his theory, for he says that it is the epitome of the views of various schools of jurisprudence, we do not possess in our hands today any sources in the elaboration of his theory, for he says that it is the epitome of the views of various schools of jurisprudence, we do not possess in our hands today any source discussing comprehensively the problem of the Caliphate dating back beyond the fifth/11th century. The Usul al-Din of 'Abd al-Qahir al-Baghdadi gives theologically a more copious discussion of the Imamate than al-Mawardi's book, but al-Baghdadi (d. 429/1037) was a contemporary of al-Mawardi. Hence, the conclusion is that most of al-Mawardi's ideas are partly a heritage of the past and partly a clever manipulation of the opinions current in his time.

A closer examination of his work, however, discloses that he is not a mere recorder of facts handed down to him but a shrewd statesman and diplomat. There is enough historical data to sanction the view that on many fundamental questions al-Mawardi's opinions were dictated by the exigencies of his time and the special circumstances of his life. In the preface of his al-Ahkam al-Sultaniyyah he writes,

“Since these principles of royalty are mainly concerned with the conduct of rulers, and since the direct application of these principles to the entire business of government prevents the rulers from an inquiry into their true nature, and because these rulers are too engrossed in State affairs and diplomacy, I have brought out a separate book discussing all of them, in obedience to the behest of one whose allegiance is essential in order that he may be informed of the different schools of law and may know what the people owe to him so that he may demand its fulfillment, and what he owes to them so he may fulfill it. [And he has asked to be informed about these things] out of love for justice in his enactments and decisions and for the sake of equity in his imposts and rewards.”¹

The mention of authority in this passage refers to the Caliph, especially because al-Mawardi had been raised to the high office of Aqda al-Qudat,² and represented the Caliph in his negotiations with the Buwaihids.

Further, it is necessary to point out that the declining power of the Buwaihids in the beginning of the fifth/11th century because of internal conflicts and insurrections in the army and because of Mahmud of

Ghaznah's solicitations for the 'Abbasids, made the Caliph al-Qadir and his son al-Qa'im aspire to regain the lost glory of their fore-fathers. The first step in this direction was the legal definition and exposition of the powers and prerogatives of the Caliph which had well-nigh been forgotten and had fallen to oblivion.

The historical situation explains al-Mawardi's efforts to propound a theory of the caliphate in which everything depends on the authority of the Caliph, in an age in which the prestige of the Caliphate had fallen to its lowest ebb. Al-Mawardi's endeavours have been supposed to be directed to the theoretical discussion of an ideal State. This view is however, untenable on account of the fact that al-Mawardi is, truly speaking, not a philosopher, and is least interested in abstract thinking. He is a jurist and builds on the opinions of his forbears, gives a wider scope to these opinions, and uses his own wisdom to apply them intelligently to the special conditions of his own times.

His greatest merit, therefore, lies in the fact that he abstains from abstract speculation and correlates the opinions of the jurists to the historical perspective of his age. Similarly, as already remarked, he is not a mere compiler or interpreter and expresses views opposed to the views of earlier authorities, or gives out opinions altogether original.

Now, it will be useful to pick up the main points in al-Mawardi's theory and compare them with the contentions of the ancient jurists, on the one hand, and with the contemporary political conditions, on the other. This will give us a true estimate of al-Mawardi's achievements.

1. The institution of the Imamate is a necessary requirement of the Shari'ah and not of reason. The appointment of an imam by the consensus of the Muslim community is obligatory.³ There is a similar passage in al-Baghdadi,⁴ who remarks that this is al-Ash'ari's opinion is opposed to the Mu'tazilite view.

2. The Imamate is instituted by means of election. The Electoral College shall consist of persons with special qualifications.⁵ Also, the candidates for the Imamate must fulfil certain conditions.⁶ This elective principle of the Imamate is obviously opposed to the Shi'ite claim of bequeathal or divine nomination. Al-Mawardi, however, does not discuss the election of a licentious person as Imam. Al-Baghdadi says that his election will be void, even if it has taken place through a properly constituted Electoral College. Al-Mawardi's omission is deliberate, being a concession to the Buwaihids, who appointed the Caliphs to suit their selfish ends.

3. The right of franchise is enjoyed not only by the people living in the capital. The Caliph is, however, traditionally elected in the capital because the death of the previous Caliph is first known there, and political considerations require the immediate appointment of a new Caliph, and also because most people possessing the necessary qualifications for the Imamate generally reside there.⁷ This principle was hotly contended by the Khawarij who believed in complete democracy and universal franchise.

4. Among the seven conditions which according to al-Mawardi must be fulfilled by a candidate, the seventh one, that is, the Quraishite descent is very important. Al-Mawardi lays great stress on it and says that if anyone

objects to it on the ground that it excludes non-Quraishites from the Caliphate, such an objection would not be considered, because it was this Quraishite descent that was presented by Abu Bakr as an argument for preference in the election of Saqifah Bani Sa'idah.⁸

5. The Imam is appointed in one of two ways:⁹ (a) He may be elected by the Electoral College, or (b) he may be nominated by the ruling Imam.

In the first case some scholars say the Imam must be elected by all the members of the Electoral College in all the cities. Others oppose this view and say that Abu Bakr was elected only by the citizens of Madinah. Still others assert that only five persons are sufficient to elect the Imam, as happened in the case of Abu Bakr and 'Uthman. In al-Mawardi's opinion, even one person is enough to elect the Caliph.¹⁰ He cites the tradition of 'Abbas as evidence. 'Abbas said to 'Ali, "Stretch your hand, I will swear my allegiance to you, and when people come to know that the Prophet's uncle has sworn his allegiance to his nephew, nobody would object to your Imamate." This opinion has also been corroborated by al-Ash'ari.¹¹

6. The above extreme opinion has been advocated by al-Mawardi to advance another important opinion given in the next section, where he discusses the case of two candidates equally qualified for the Imamate. He says that the Electoral College may nominate anyone of the two as Imam without assigning any reason.¹²

7. The election of a less qualified person in the presence of a more qualified person is perfectly legal, provided the former fulfils all the conditions of the Imamate.¹³ It was this principle under which most of the worthless caliphs took refuge. It was also directed against the Shi'ahs, who believe that an inferior person cannot have precedence over a superior one. They coined this theory to assert that since 'Ali and his descendants in the Fatimid line were superior to the rest of mankind, anyone who assumed the Caliphate power was a mere usurper. The refutation of this dogma was essential to establish the above doctrine. But al-Mawardi is not alone in this respect, for this is the agreed opinion of Sunnite jurists and theologians.

8. If there is only one suitable candidate for the Imamate, he automatically becomes the Imam, and election is required.¹⁴ Al-Mawardi seems to be inclined to this view; the jurists and scholars, however, assert that election must be held even if there is only one candidate for it; otherwise the Imam cannot acquire legal status. This insistence on election is obviously directed against the Shi'ite theory of divine appointment.

9. The existence of two Imams contemporaneously is illegal.¹⁵ Al-Ash'ari opposes this view and says that two Imams at a time are possible if their territories are far-flung and widely separated by an ocean, which hinders easy communication between the two. But al-Mawardi insists in his view to rule out the Fatimids and the Umayyads of Spain.

C. Succession

1. The ruling Imam can nominate his successor. There is complete consensus on this point in the Muslim community.¹⁶ The Muslims accepted 'Umar as caliph not on the suggestion of Abu Bakr but in obedience to his order as Caliph.¹⁷ Similarly, when 'Umar appointed a limited council to

elect his successor it was an order from the Imam and there was no choice for the Muslims to do otherwise.¹⁸

2. The Imam can nominate any suitable person as his successor, provided he does not happen to be his father or son. The concurrence of the ahl al-hall w-al-'aqd is not necessary;¹⁹ but if he nominates his son, the concurrence must be obtained.²⁰ Also, he can nominate any other relation without requiring the concurrence.²¹

It was this theory of nomination that cut at the very root of democratic ideals in Islamic polity. It has been persistently resorted to by every Muslim ruler after the days of the pious Caliphate, to perpetuate dynastic and despotic rule among the Muslim peoples. Thus, apparently the structure of the Caliphate was maintained by the Umayyads, the 'Abbasids, the Fatimids, and the Turks, but the spirit of Islamic democracy was cast away with the shedding of the blood of 'Uthman, the third successor of the Prophet.

Al-Mawardi's contention that Abu Bakr's nomination of 'Umar could not be challenged by the Companions, for it was the valid enactment of a valid Imam, is nothing but historical fiction having no basis in historical fact. One of the earliest and most reliable authorities on that period, ibn Qutaibah, reports in his *al-Imamah w-al-Siyasah* that when symptoms of death approached Abu Bakr, he became very anxious as to who should succeed him to the Caliphal authority.

After much deliberation he decided to nominate 'Umar to succeed him. He called 'Uthman to his bedside and dictated to him the deed of succession. When the news spread, people flocked to him from every quarter and began to question his choice. Thereupon he said, "If God asked me about this matter, I would tell Him that I appointed over them one whom I considered to be the best of them."

After this he ordered a general assembly of the people, and when they gathered together, he addressed them and said, "If you so desire, you may sit together and elect a person whom you like, but if you wish that I should use my discretion in the matter on your behalf, then I assure you by One other than whom there is no God, I will spare no pains in doing you the best service." He then stopped and wept and the people wept with him and said, "You are the best and most informed amongst us, so you choose for us." And when the crowd dispersed he called for 'Umar and gave him the deed of succession and said, "Go to the people and inform them that his is my suggestion, and ask them if they hear it and obey it." 'Umar took that document and went to the people and addressed them. They all said, "We are all ears and obedience to it."²²

This testimony of ibn Qutaibah is most unequivocal and decisive. It completely abrogates al-Mawardi's theory of nomination. It is quite obvious that Abu Bakr did not deprive the people of their democratic right to elect the head of the State freely. He simply gave his personal opinion. The people could accept his opinion as well as reject it. There was no political bar in their way, no Caliphal decree to prevent the exercise of their right of franchise.²³

Al-Mawardi's second argument in support of his thesis that the limited college of electors prescribed by 'Umar had the sole right of nominating the

new Caliph,²⁴ is nothing but a deliberate effort to interpret ancient practice to justify later historical phenomena. In fact, ‘Umar did nominate the limited council at the suggestion of ‘A’ishah to prevent civil strife after his death.²⁵ He knew full well that the probable candidates for the Caliphate were the very people whom he had nominated for it. Not only that, he was perfectly sure that either ‘Uthman or ‘Ali would be elected.²⁶

Therefore, to facilitate the new election he fixed a procedure that was least pregnant with evil and the best guarantee against civil discord. The stern warnings which he gave to the dissentient members of the Electoral College and the strict directions which he issued about the conduct of the election were but the last symbols of his great over-riding authority over the hearts and minds of people, by means of which he so wonderfully ruled half the world for ¹² years. But he did not lay down a permanent principle of Islamic polity, for this he could not do, since there was no warrant for it in the Qur’an or the Sunnah.

Even Abu Bakr could not devise the theoretical foundations of the Caliphate, for during the last moments of his life he said that the one great regret he had was that he could not ask the Prophet to enlighten him on three problems. Regarding two of these, he said, “I should have asked who would succeed him in political power after him? If he nominated anyone, nobody could challenge his nominee on this issue. And I should have asked him whether the Ansars were entitled to any share in political power.”²⁷

Umar’s arrangement was, therefore, dictated by purely prudential considerations. A proof of this assertion is that he categorically declared that the Ansars were not entitled to any share in the sovereign power,²⁸ although Abu Bakr was doubtful on this issue, and although many of the later jurists did not accept ‘Umar’s ruling on this point. The truth is that ‘Umar took this extra-ordinary step for the defence of the State and not for the defence of a principle, for there was no clear principle before him. Hence, the construction of a political theory out of his ruling can be neither justified nor appreciated as an achievement in political thought.

But al-Mawardi was not very concerned about theory. He was a leading Sunnite legal doctor of the Shafi’ite school, and was intimately associated with the ‘Abbasids; hence, his chief interest lay in emancipating the Sunnite Caliphate from the Shi’ite tyranny of the Buwaihids. This explains why he gave the stamp of validity to the monarchical system of the ‘Abbasids. He had already before him the precedent of the Umayyads. Moreover, the jurists had, by the force of circumstances, reconciled themselves to the imperialistic order of the day, and given it to the form and sanction of religious authority.

Al-Mawardi, therefore, found no difficulty in taking his cue from the prevailing ideas of his time. His main contribution to Muslim political thought lies in the transformation of these ideas into a system, directly related to historical practice. He was not a visionary and idealist like the jurists or the scholastics, and like them did not sit to speculate a vacuum. He was a man of the world; he tried to solve its problems as best as he could.

3. The nomination of a person as heir apparent becomes effective only when he declares his consent to it. The Imam cannot withdraw the

nomination until there occurs in this heir apparent some important change which invalidates him legally. So, also, an Imam cannot be deposed until a similar change occurs in him.²⁹ Now, these are only logical deductions from the fundamentals of the Shari'ah for there are no historical precedents to vouch-safe them.

4. The Imam can appoint the Electoral College as well as the persons who may contest for the Imamate.³⁰ This opinion is based on the election of 'Uthman by means of a limited shura appointed by 'Umar, the derivation of a general principle out of it is certainly most dangerous to sound polity and to the stability of the State. The piety, honesty, intelligence, and statesmanship of 'Umar could well be relied upon. The same cannot be said of another personality after him in the Muslim history.

Notwithstanding this, historians have held that 'Umar was mistaken in taking this step.³¹ It is a well-known fact that most of the members of the shura, who came out unsuccessful in the contest, at once started plotting against 'Uthman and began to aspire for the Caliphate.³² Apart from this historical fact, if the right of nominating the electorate as well as the candidates is conceded to the Imam, it is bound to make him absolute and despotic. In truth, it was this theory that developed into divine right with 'Alids and the 'Abbasids. And it was this theory that throttled the growth of democracy in Islamic polity.

5. The Imam can nominate two or more heirs apparent to succeed him one after the other. The argument has been derived from the battle of Mubah, in which the prophet appointed Zaid bin Harithah as the Commander of the Muslim forces and said that if he fell in fighting he was to be succeeded in command by Ja'far bin Abi Talib who was to be succeeded by 'Abd Allah bin Rawabah. If ibn Rawabah also fell, then the Muslims could choose anyone from among themselves as their commander. Apparently, the citation of this incident in support of a fundamental issue, like that of the Caliphate, is but fake reasoning.³³

This practice of appointing two or more heirs apparent proved to be the greatest political evil in Muslim polity. It often engendered palace intrigues and gave rise to internecine wars and dynastic feuds.

D. Designation And Privileges

1. When a person is duly elected as Imam, the people should entrust all their affairs to him and must give him their unquestioning obedience. The Imam may not consult them in the affairs of the State, yet they must obey him.³⁴

2. The Imam may be addressed as the Khalifat Allah, but the majority of jurists say that this title is forbidden, for no human being can represent God on Earth, since man is mortal and imperfect. Hence the Imam may either be a mere Khalifah or Khalifat al-Rasul Allah.³⁵ Once when Abu Bakr was addressed as Khalifat Allah he exclaimed, "Do not address me as Khalifat Allah but as the Khalifat al-Rasul Allah."

E. Duties And Functions Of The Imam

The Imam has the following ten principle duties to perform:

1. The safeguard and defence of the established principles of religion as understood and propounded by the consensus of ancient authorities. If anyone innovates an opinion or becomes a sceptic, the Imam should convince him of the real truth, correct him with proper arguments, and make him obey the injunctions and prohibitions of the Shari'ah, so that the people at large may be saved from the evil effects of heresies.

This is undoubtedly the foremost duty of the Imam under the Shari'ah. But unfortunately it is under the cover of this pre-text that throughout the last 13 centuries, adventurers and self-seekers have striven to carve out political fortunes for themselves. The second civil war of Muslims was fought by the Umayyads, the Hashimites, and the Zubairites under the same pre-text.

When the 'Abbasids, the Fatimids, and the Safawids came to power they called themselves the Defenders of Faith, and crushed every political dissentient in the name of religion. Even today there can be evinced a great effervescence for religious revival in all the Muslim lands, but everywhere the undertone is political, not religious.

Al-Mawardi's enumeration of these duties, however, was very effective and timely, since it came out as a stern warning to the Buwaihids, who had over-powered the Caliph in Baghdad, and who professed a heretical faith.

2. The dispensation of justice and disposal of all litigations in accordance with the Shari-ah. The Imam should curb the strong from riding over the weak and encourage the weak to take their due in face of the strong.

3. The maintenance of law and order in the country to make it possible for the people to lead a peaceful life, proceed in their economic activities freely, and travel in the land without fear.

4. The enforcement of the criminal code of the Qur'an to ensure that the people do not outrage the prohibitions of God, and that the fundamental rights of men are not violated.

5. The defence of the frontiers against foreign invasions to guarantee the security of life and property of Muslims and non-Muslims alike in the Islamic State.

6. The organization and prosecution of religious war against those who oppose Islam or refuse to enter the protection of the Islamic State as non-Muslim subjects. The Imam is bound to be the covenant of God to establish the supremacy of Islam over all other religions and faith.

7. The collection of kharaj and zakat taxes in accordance with the laws of the Shari'ah and the interpretation of the jurists, without resorting to extortion by pressure.

8. The apportionment of allowances and stipends from the State treasury (Bait al-Mal) to those who are entitled to them. This money should not be expended with extravagance or stinginess, and must not be either pre-paid or delayed.

9. The appointment of honest and sincere men to the principal offices of State and to the treasure to secure sound and effective administration and to safe-guard the finances of the State.

10. The Imam should personally look into and apprise himself of the affairs of his dominions so that he may himself direct the national policy

and protect the interests of the people. He should not entrust his responsibility to others and engross himself in luxury or religious devotion.

And when the Imam has carried all these duties efficiently, the people must offer him two things, obedience and help.

This enumeration of the ten-fold functions of the Imam is arbitrary. Number ten has been chosen particularly because it is an auspicious and mystical number. The notable fact here is that, while his predecessors and successors lay great emphasis on the first two points, viz, the safe-guard of religious principles and the dispensation of justice, as the principal duties of the Imam, al-Mawardi lays the main stress on the administrative responsibility for the carrying out of justice but also the greatest social organization to help promote the corporate life of men.

In other words, the management of the State machinery is of basic importance to him. This explains why he devotes only one-tenth of his book to the exposition of the theory of the Caliphate and uses the rest of his work to elaborate the detailed apparatus of government which hinges on the central authority of the Caliph.

The nebulous nature of the dispersion of State power had led to the dreadful tussle between the Buwaihids and the 'Abbasids. The Buwaihids, who had no legal claim to sovereignty, and who had not clarified their position, had long been intriguing to over-throw the Caliphate outright. Al-Mawardi's attempt, therefore, at defining in detail the responsibility and scope of Caliphal powers in relation to normal administration, was most plausible and a direct hit at the Buwaihids.

Further, he made his treatise an inviolable document by reinforcing it with the argument of earlier historical practice, dating back to the time of the Prophet, and by basing it on the opinions of the leading jurists of Islam. It is significant to note that al-Mawardi hardly quotes anywhere any of these jurists, but since he was the greatest judge of Baghdad, his declaration in the preface was taken as sufficient guarantee of his veracity. There is no ground to question his bona fides, yet it would have been more commendable if he had given the actual authorities.

F. Deposition Of The Imam

Al-Mawardi has given detailed consideration to the subject of an Imam's deposition. In the first place, arguing on the basis of legal deduction from the fundamentals of the Shari'ah he says that once a person is elected as Imam, he cannot be removed from that office until there has occurred some definite change in him.³⁶ Then after discussing the duties of the imam, he reverts to the subject and dilates on it at length. He says that the Imam loses his title and authority on account of one of the following reasons:

1. If there occurs a change in his moral status, technically known as 'adalah (sense of justice). The moral change is of two kinds:

(a) The one connected with the body, that is, if he becomes a slave to his inordinate desires and flouts openly the prohibitions of the Shari'ah. In such an event, a person can neither be elected as Imam nor continue as such.³⁷ Abu Ya'la rejects this opinion and holds the opposite view.³⁸

(b) The one connected with his faith, that is, if a person holds opinions contrary to the established principles of religion, or holds such twisted

opinion as amount to an abrogation of the accepted principles, he can neither be initiated as Imam nor continue to hold that office.³⁹ In this there is a clear denunciation of the stand of Buwaihids and of the Shi'ite and Fatimid claims to the Caliphate.

2. If there occurs a change in the person of the Imam. It is of three kinds: loss of physical senses, loss of bodily organs, and loss of ability to supervise and direct the affairs of the State.

(a) Among the defects which occur in the physical senses, the two most important ones which preclude a person from election to the Imamate or make unfit to continue in office are the loss of mental faculty and the loss of eyesight. The first case is obvious and needs no comment. But the second has had a profound bearing on the course of Muslim history. The practice of putting out the eyes with hot iron to prevent a person from wearing the imperial purple was undoubtedly borrowed from the Byzantine Empire; the opinion of the Muslim jurists on the issue, however, gave it an added importance as an instrument of tyranny in Oriental lands.

The dreadful effect of this foul practice can be gauged from the fact that about two dozen 'Abbasid Caliphs were thus blinded to be dethroned from the Caliphal seat. The juridical opinion referred to above is that a blind person is unqualified to give witness or sit as a judge in a court of law; he is, therefore, much more unqualified to serve as the Head of the State.⁴⁰

(b) Loss of bodily organs. It is of various kinds. If it does not hinder the performance of normal duties, and does not disfigure the features or the external beauty of the body, it will be of no account.⁴¹

In certain cases when the loss of organs renders a person helpless and makes him incapable of doing anything, he can neither be elected as Imam nor can he continue in that office. Such is the loss of the two hands or of the two feet.

Al-Mawardi discusses the details of other losses too, but they are not pertinent to our purpose here.

(c) The loss of personal ability to supervise and direct is of two kinds:

(i) If the Imam is over-powered by one of his counsellors and assistants, who appropriates all authority to himself, but does not openly defy the Imam, the Imam will continue in his office, provided the usurper rules in accordance with the injunctions of the Shari'ah, and in deference to the accepted norms of justice. This is to ensure that the functions of the Imamate should continue to be performed, and that the people do not fall prey to the ways of evil on account of the non-enforcement of the laws of the Shari'ah.⁴² But if his conduct is opposed to the principles of religion and justice, he will not be tolerated in that status, and the Imam shall have to seek the help of a person who can oust the usurper and restore supreme authority to the Caliph.⁴³

This principle has been elaborated by al-Mawardi with great care and legal acumen. In the next chapter he takes it up again and discusses it in full detail.⁴⁴ This principle which had no sanction in ancient authority or in the opinions of the jurists, was dictated by the force of circumstances in which the 'Abbasid Caliphate had been placed during the two centuries preceding the death of al-Mawardi.

The Buwaihid usurpation in Baghdad and falling of the Caliphal power into insignificance necessitated the evolution of a formula which suited the exigencies of the times and covered the de facto relation that existed between the Buwaihids and the 'Abbasids. This was a clear departure from the principle of the Caliphate enunciated by al-Mawardi in the earlier part of his book. But he devised a via media to remove this glaring contradiction.

If the absolute governor or the usurper (Amir bi al-Istila') declares his allegiance to the Caliph and promises to maintain the unity of the Caliphate, enforces the laws of the Shari'ah which cannot be let go by default, and because of the unavoidable condition created by the act of usurpation.⁴⁵

In this theory there is, on the one hand, an overt recognition of the situation prevailing in Baghdad and, on the other an unconcealed warning to the Buwaihids that if they transgressed their limits they could be brought to book with the help of the Ghaznawid power which was an open ally of the 'Abbasid caliphate. In a passage, al-Mawardi says that in case the usurper shows an uncompromising and rebellious attitude, the Caliph can call in the help of one who can relieve him of the straits. The person referred to is none but Mahmud of Ghaznah.

There is little doubt that al-Mawardi was influenced by the circumstances of his environment in the enunciation of this theory, but the deviation from the original principle completely nullified the true conception of the Imamate as demonstrated in the days of the Caliph 'Umar. Nay, it contributed directly to a political theory which encouraged adventurous and ambitious men to impose them on the will of the people with brute force and sheer might. Further, if it served as one of the main incentives for the dismemberment of the 'Abbasid Empire, it also greatly influenced the suppression of democratic thought and practice in the Muslim world. Al-Mawardi may have been well-intentioned but the legacy he left completely changed the concept of Muslim polity in the centuries that followed. And the charge that occurred was simply un-Islamic, undemocratic and vicious.

(ii) If the Imam falls a prisoner to the hands of an enemy it will be the duty of the entire Muslim people to endeavour to emancipate him,⁴⁶ and as long as there is any hope of his deliverance he will continue as Imam and another person may be elected to officiate in his absence. But if all hope is lost, he will be deemed to have relinquished his office, and a new election shall take place.

If the Imam is captured by a Muslim rebel army, and the rebels have not appointed an Imam of their own, the captured Imam shall continue to command the loyalty of the people, and an acting Imam shall be appointed by him, if possible, or by the Electoral College. But if the rebels have appointed an Imam of their own, the existing Imam shall forfeit his claim to the Imamate, and the responsible men (ahl al-hall w-al-'aqd) shall elect a new Imam according to their discretion.⁴⁷ Al-Mawardi's wording in this passage is full of meaning. He means to say that a victorious rebel leader does not automatically become the Imam.

G. Conclusion

Al-Mawardi's great contribution to political thought was that he gave a detailed account of the administrative machinery of the Government of his

time and in formulating his political theory he took full cognizance of historical facts and, unlike the jurists and the scholastics, did not indulge in empty speculation, but with all the good things that can be said about al-Mawardi, he had one short-coming - he could not evolve a philosophic conception of the State. He did not discuss the meaning, scope, jurisdiction, and obligations of the State, gave no conception of sovereignty, and were completely ignorant of the idea of a constitutional democracy. Lack of constitutional theory not only reduced the value of his work, but also adversely affected the later development of Muslim Political thought.

23. In one of his pilgrimage to Mecca 'Umar heard a report that a person was saying, "By God, if 'Umar died I would declare my allegiance to so and so, and by God, Abu Bakr's election was certainly defective, but it was made effective later on." 'Umar became enraged at this report, and wanted to take immediate action, but at the advice of 'Abd al-

Rahman bin ‘Auf, returned to Medina and ordered all the judges, governors, and chiefs of the army to proceed to the capital. When all had come, a public assembly was held where the Caliph delivered one of the most important addresses of his life.

After saying many important things on this occasion, he said, “Let not anyone be deceived to say that the election of Abu Bakr was defective and that it became effective later. And among you there is none like Abu Bakr towards whom the people may look with love and reverence, therefore, if anyone of you swears allegiance to a person without consulting the general body of Muslims, such a person shall not be deemed as elected, and the likelihood is that both these persons may be beheaded.” (Ibn Hisham, *al-Sirat al-Nabawiyah*, Vol. 4, pp. 308 - 09).

Chapter 37: Political Theory Of The Shiites

The death of the Prophet of Islam ushered an era which is known as the period of the Orthodox Caliphate (11 - 41/632 - 661).

The supporters of 'Ali the fourth Caliph in the chronological order 35 - 41/646 - 661), were known as the Shi'ah which literally means a faction, a supporting group in the sense that they supported 'Ali's claim to succession after the death of the Prophet, both as a temporal ruler and a religious leader.

It may be stated authoritatively that 'Ali's claim to the Caliphate was not regarded by his supporters and adherents as a political ambition. On the contrary, it was considered that he had been ordained by Providence to succeed the Prophet and the Prophet himself had placed the question of succession beyond any doubt by his testament, as it were, at Ghadir al-Khumm.¹

During the Caliphate of 'Uthman, ibn Saba' of Yemen, who had settled ultimately in Egypt, openly preached that the first three Caliphs were usurpers as distinguished from 'Ali who was divinely ordained to succeed the Prophet as his executor or plenipotentiary (wasi). The extreme Shi'ites (Ghulah) believed that the Prophet himself was reincarnated in the form of 'Ali and "that the divine spirit which dwells in every prophet was transferred at Mohammad's death to 'Ali and from 'Ali to his descendants who succeeded him in the Imamate."

It would be pointless, so far as we are concerned, to access and evaluate the truth of the claim made by the Shi'ites that 'Ali had been designated as the Prophet's successor by the Prophet himself in accordance with the command of God, but it is necessary to point out that the Shi'ites, whether holding moderate or extreme views, refused, as it were, from the beginning to concede with the ijma' has any authority to confer any person the right to govern a Muslim State. They maintained that at all times a living descendant of 'Ali, whether concealed (mastur) or unconcealed, demands and receives allegiance from the Muslims and is in point of fact the only rightful Caliph (temporal ruler) and Imam (religious leader) of the Islamic peoples.

It may perhaps be added that the term Shi'ah was invested with all its dogmatic connotations after the coming into power of the 'Abbasids. In the Beginning the word only meant a group of people which were in favour of the succession of 'Ali to the Caliphate.

With the rise of the Umayyads the pure Arabs found greater favour with the rulers than the clients of the subject races. This policy which, most probably, had been initiated by the third Caliph, no doubt, for justifiable reasons, would not have proved disastrous in itself if Yazid had not perpetrated the horrible deeds which are known as the tragedy of Karbala. The old rivalry of the Umayyads and the Hashimites, which had remained subdued during the life-time of the Prophet, now manifested itself in many ways.

All these factors led to what is known as the 'Abbasids propaganda carried on in collaboration with the Shi'ites in the name of Hashim who was acceptable both to the supporters of 'Ali and the descendants of 'Abbas as against the Umayyads who had taken possession of the State and were

living in luxury, while their more celebrated Quraish brethren were forced to act merely as spectators of the splendour of the rival branch.

The relationship of the Hashimites and the 'Alids with the Umayyads would appear from the following genealogical tables.

The 'Abbasid propaganda ultimately bore fruit and the House of 'Abbas, mainly with the help of the Iranians who had flocked to Abu Muslim, an Iranian leader of great courage and patriotic fervour, succeeded in their machinations. The Umayyads were over-thrown; Marwan, the last Caliph was slain on the 15th Dh. H. 132/August 5, 750, followed by a general massacre of the members of the Royal House of the Umayyads, and Saffah ascended the throne 132/750.

After the revolution had become an accomplished fact, the Shi'ites who disillusioned and sadly disappointed, were under the impression that a member of the House of 'Ali would be enthroned. The treacherous murder of Abu Muslim (138/755) further convinced the Shi'ites, if such conviction was needed, that their 'Abbasid cousins were no less hostile to them and their claim than the Umayyads and it was during this period of bitter frustration, disappointment, and stark disillusionment that the term "Shi'ah" was invested with its basic political and religious connotations.

The Shi'ites claimed that the House of 'Abbas had usurped the Caliphate as the Umayyads and the three Orthodox Caliphs had done. They contended that, although de facto sovereignty vested in the 'Abbasids, legal sovereignty remained with the descendants of 'Ali who were divinely ordained to be the temporal and religious leaders of the Islamic peoples.

The Orthodox Shi'ites (Ithna 'Ashariyyah), as contra-distinguished from other sects who were either extremists in their beliefs or had made a drastic departure from the tenets of their orthodox brethren, believed that the Imamate had descended from Mohammad, the Prophet, to 'Ali and his descendants according to the table given below.

According to the Shi'ite traditions, the 12th Imam, namely, Mehdi (the expected one), was born in Samarra in 255 or 256/ 868 or 869. At the time of the death of his father, he would have been only four or five years of age. He was designated as Imam a few days before the death of his father and very soon after his death he disappeared or went into concealment which consists of two periods, short (sughra) and long (kubra). For a period of 70 years he was represented by four wakils (agents or advocates), namely, 'Uthman ibn Sa'id, Abu Ja'far, Abu al-Qasima and Abu al-Hassan.

The last named refused to nominate an agent on his behalf and died saying, "Now the matter is with God." Accordingly, the period when the hidden Imam was represented by the wakils is known as the lesser concealment and this period extended to 329/940. Since that time the Shi'ite Mehdi or the hidden Imam has been in "the great concealment" and he is expected to return near the end of time.

The political theories of the Orthodox Shi'ites depend on three fundamental precepts, namely, (1) the divine right of the descendants of 'Ali to succeed to the Imamate, (2) the sinlessness of all the imams, and (3) the return of Mehdi, the 12th Imam.

The first precept means that democratic election, i.e., consent of the people or any other method of choosing a successor to Prophet Mohammad is manifestly and palpably wrong and, as a matter of fact, sinful. Sovereignty, with all responsibilities that it entails for its holder as a temporal ruler and duties that it entails for him as a religious chief, is a gift from God which is conferred only on those who have descended from Mohammad through 'Ali and Fatima. (The descendants of 'Ali not born of Fatima has no right to the Caliphate or the Imamate.) The Shi'ite theologians obviously contend that the divine right of the Imam to become the Commander of the Faithful depends on the word of God as conveyed by the Prophet to 'Ali and by 'Ali to his descendants.

It has been conjectured, however, that the theory of the divine right of the Imams, which was analogous to the theory of the divine right of kings, was evolved and developed by the Persian supporters of the House of 'Ali who had witnessed the rise and fall of great empires wherein the emperors more often than not laid claims to Godhead.

In all great Eastern empires of the remote past, the kings at some time or another claimed to be gods or semi-gods at least, perhaps in order to stabilize the State and to keep the subject races unified through the worship of the sovereign. When we consider that the Shi'ite theologians and historians have accepted it as a fact that a daughter of the last Sassanian King of Persia was married to Hussain (all Imams being descendants from her), it becomes easy enough to appreciate the position of the Persian adherents of 'Ali in relation to the Caliphate and the Imamate. The fact that many of the Shi'ah sects believed in the Godhead of 'Ali further lends support to the theory that the concept of the divine right of the Imams to succeed the Prophet and infiltrated into Arabia through Persian channels.

Once we accept that the Imams are divinely ordained to rule the Faithful, we must accept the fact that the State as envisaged by the Shi'ite theologians is a theocracy in the most rigid sense of the word, in which the ruler - temporal head as well as a religious chief - cannot be deposed even if he palpably commits sins and crimes of a most serious nature.

This is the logical conclusion of the acceptance of the theory of divine right because the supporters of this theory would contend that "what our limited knowledge visualizes as a crime or as a sin is really virtue." We, with our limited knowledge and understanding, cannot appreciate or assess the significance of an act of the Imam. This logical conclusion was accepted by the Isma'ilites specifically and categorically, although the Orthodox Shi'ites contented themselves with saying that it is not possible for the Imam to commit a sin or a crime.

The concept of sinlessness is a logical corollary of the acceptance of the first precept.

It would follow, therefore, that in theocracy as envisaged by the Shi'ites, the Caliph who is also the Imam can neither be deposed nor interfered with in any matter of administrative or religious nature. From the purely political point of view, this theocratic State has elements of stability and strength which are peculiarly its own, but it may not appeal to those who believe that sovereignty vests really in the people ultimately and that the negation of the

right to depose, irrespective of the fact whether the ruler is just or unjust and cruel, is contrary to all principles of equity and justice inherent in all constitution-making.

The Shi'ite theologians may reply that the Imam, being divinely ordained, is capable of committing a sin or crime and will exercise his authority in a benevolent manner, and although he will be sovereign in every sense of the word, he will be bound by the restrictions imposed upon him by the Qur'an, the traditions of the Prophet as narrated by the Imams and the examples of the Imams' lives.

The belief that the 12th Imam, Mehdi, is bound to return is most significant in the sense that the Shi'ite theologians are in a position to encourage their adherents whenever they are passing through dangerous or chaotic periods and ask them to stand fast since the advent of the Mehdi will be the end of all tyranny, despotism, suffering, misery, wretchedness, and sinfulness and the beginning of a new era of prosperity, bliss, happiness, and ecstasy never experienced before by humanity.

It is obvious that temporal and religious problems are to be solved during the concealment of the 12th Imam. The ideal theocratic Shi'ite State envisages the existence of righteous, erudite, competent, learned, and virtuous persons who administer the Law and solve all theological problems and juristic questions by *ijtihad* (effort). These competent persons are known as *mujtahids* and are supposed to derive their wisdom and acumen from the representatives of the hidden Imam who is in contact with them.

The *mujtahids* have always exercised very great influence in the Shi'ite States and have been considered to be the Caliphs of the Imam. It is of course possible to visualize periods when wide powers are misused and unlimited authority is converted into tyranny. Human nature is frail and whenever human beings are vested with unlimited powers, they are apt to misuse them at some time or other.

It may be stated therefore, that Shi'ite envisaged their ideal State as a rigidly theocratic one, with the concealed Imam as the arbiter of the destinies of the Faithful working out a pattern of society through the *mujtahids*, who derived their power to adjudicate from the Imam himself or his representatives with whom they are in contact. All persons, sovereigns, rulers and pontiffs, wherever they may be are usurpers if they do not derive their right to rule from the commands of the Imam or from his representatives.

The chaotic conditions which prevail will be set right by the advent or emergence of the Mehdi who will establish this ideal theocratic State, holding away over the whole world and laying the law for all creatures who inhabit it.

Political Theory Of The Ismailites

The sixth Imam of the Shi'ites, namely, Imam Ja'far Sadiq (the Truthful) is justly considered to be one of the greatest authorities on Law and tradition. He is regarded as one of the most celebrated of the jurists. He instructed some of the greatest traditionists known to the Muslim peoples and also known as the originator or, at least, the greatest exponent of the occult science known as *jafar*.

Curiously enough, it was during his life-time that the Shi'ite world was torn asunder and there emerged upon the scene a new group or sect of the Shi'ites, known by many names, for example, the Isma'ilites, as the latest research has established beyond any doubt. It is the term "Isma'ilites" which is indicative of the true origin of the sect, other appellations being either misleading or based on hostility to this sect in general and to Orthodox Shi'ites in particular.

Form the tangle of conflicting evidence, contradictory claims and inconsistent theories, the basic facts relating to the origin of this sect appear as follows:

It is admitted by all concerned that Imam Ja'far died in 148/765. Before his death he had designated his son Isma'il to his successor and the rightful Imam. Now this Isma'il died sometime between the year 136/753 and 146/763. It is clear that he could not have died before 136/754 - the year that the 'Abbasid Caliph, Mansur, ascended the throne, because we find it stated on unimpeachable authority that the fact of his death was reported to the Caliph, who, obviously, watched the movements of the Shi'ite Imams carefully and sometimes with great anxiety, because almost all the movements which aimed at the over-throw of the 'Abbasid Caliphate used the name of the reigning Shi'ite Imam as a cloak.

The 'Abbasid Caliphs, therefore, even when convinced that the Imam themselves were not in any way associated with the movement in question, very carefully kept them under State observation. According to the Shi'ites, they were, for all practical purposes, prisoners of the State and their movements were restricted by "political expediency," the seriousness or the significance of which was determined by the corresponding seriousness of the revolt or the movement which gave birth to it.

Again, this is admitted by all concerned that before the death of Isma'il, Imam Ja'far had revoked the authority of succession of the case of Isma'il and had in his place Imam Musa Kazim as the rightful successor and Imam of the Shi'ites.

The reasons, which led the Imam to take this step which caused the Shi'ite community to be torn asunder and divided into hostile groups, cannot be determined at this stage. The Orthodox Shi'ites - and Sunni authorities are not lacking in support thereof - assert that Imam Isma'il was, one unfortunate day, found drinking wine and thus committing an action which is admittedly a sin. Imam Ja'far - so the story goes - thereupon repudiated Isma'il and designated his brother as his successor.

This repudiation of sanction or authority, technically known as nass was not and could not be accepted by some of the Shi'ites because it opposed and falsified the fundamental postulates of the Shi'ites in general.

Those who would not accept this repudiation and revocation argue as follows:

The sinlessness of the Imam is an established fact. Isma'il was declared to be the Imam-Designate by Ja'far. He, therefore, was incapable of committing any sin or perpetrating any crime. The allegation that he was found drinking wine was either incorrect or related to one of those mysterious acts of the Imam-Designate the significance of which is known

to him only. Since he was incapable of committing a sin, his drinking must have been a cloak for some other activity. In other words, drinking was an appearance (zahir), the reality (batin) of which was known only to the Imam or to those in whom he confided.

The supporters of Isma‘il also contend that he was appointed Imam-Designate by Imam Ja‘far in accordance with divine command. God is infallible. It is impossible to conceive that God was not aware that Isma‘il one day would be found drinking. If, therefore, he allowed Isma‘il to be declared as the successor of Imam Ja‘far, the story that Isma‘il was found drinking wine must either be untrue or must be considered and treated as an act innocent in itself, the significance of which is known only to God, the Imam, and his successor.

They contend that it was quite possible that the wine drinking of Isma‘il may have been considered expedient by God and since all actions of the Imam flow from God, no action of Isma‘il, however sinful it may have appeared, can be considered to be unjustified and condemned, since it is in fact an act performed as ordained by Providence.

During the lifetime of Imam Ja‘far, the controversy and the ferment consequent upon the revocation of authority remained subdued, but as soon as he died the supporters of Isma‘il came forward and contested the succession of Imam Musa Kazim. Since Isma‘il had died during the lifetime of his father, it was contended that the nass (sanction, authority) had been transferred from Isma‘il to his son Mohammad who had from then on become the rightful Imam, the spiritual and temporal leader of the Shi‘ites and the rightful ruler of all territorial possessions.

There are some who believed that Isma‘il had not really died and was the last rightful Imam, but they were in a minority. Slowly but steadily the supporters of Mohammad, the son of Isma‘il gained ascendance and laid the foundation of the Isma‘ili sect which culminated in the establishment of one of the greatest Muslim empires of the East - the Empire of the Fatimids of Egypt.

DeGoeje and Dozy have it “that a certain ‘Abd Allah b. Maimun, an oculist (qaddah) by profession and a Persian,” was inspired by religious fervour, political ambition, and inveterate hatred against the “Arabs and Islam,” to “bind together in one association the conquered and the conquerors, to combine in one secret society, wherein there should be several grades of indication, the free thinkers who saw in religion only a curb for the common people and the bigots of all sects, to make use of the believers to bring about the reign of the unbelievers and of the conquerors to overthrow the empire which they had themselves founded, to form for himself, in short, a party, numerous, compact, and schooled to obedience, which, when the moment was come, would give the throne, if not to himself, at least to his descendants. Such was the dominant idea of ‘Abd Allah b. Maimun, an idea which, grotesque and audacious though it was, he realized with astonishing tact, incomparable skill, and a profound knowledge of the human heart.”

There is a very significant old adage that if you fling sufficient mud some is bound to stick. This is exactly what happened in the case of Maimun and

his son 'Abd Allah. The Orientalists - nay even such an erudite Iranian scholar as Mohammad Qazwini, the editor of Tarikh-i Jahan-Gusha by 'Ata Malik Juwaini - were misled by the voluminous 'Abbasid propaganda, hostile commentary of the Orthodox Shi'ites, and the specious argument of those opposed to the Isma'ilites, into thinking that Maimun and his son 'Abd Allah were opposed to the tenets of Islam or were inspired by the hatred for the Arabs. As a matter of fact, as the latest research has established beyond any doubt, Maimun was the name adopted by Imam Mohammad when he went into concealment (ghaibah). In other words, during the period of concealment those who were in his confidence knew Imam Mohammad to be Maimun.

No doubt, this is a daring postulate but, once we accept it, all conflicts are resolved, all inconsistencies removed, and all confusions laid to rest. It is quite evident that when the Orthodox Shi'ites assert that Maimun was a narrator of traditions under Imam Baqir and Imam Ja'far, they are speaking the literal truth. So are the Isma'ilites when they say that Maimun and his 'Abd Allah were the staunchest supporters of the Isma'ilite cause.

It is clear that the Orthodox Shi'ites were not taken into confidence by the supporters of Imam Mohammad when he was in concealment and were, therefore, unable to appreciate that Maimun and Mohammad are one and the same person. By accepting this postulate we are also in a position to appreciate and understand the attitude adopted by the 'Abbasid Caliphs in relation of both Maimun and his son 'Abd Allah. It is quite likely that some of the spies of the 'Abbasids might have brought to the notice of the Caliph that Maimun was the concealed Imam, and political expediency might have forbidden the broadcasting of this highly significant and equally dangerous information.

The stream of invectives poured upon the head of Maimun and his son 'Abd Allah by the 'Abbasid caliphs, the Orthodox Shi'ites, and the Sunni historians in general, is in itself significant and tends to support the theory that both these persons were not only supporters of the Isma'ilites' cause but were the pivots and props thereof.

After the death of Ja'far, Mohammad went into concealment adopting the name of Maimun. He spent some time at Kufah and Rayy. The 'Abbasid Caliph being informed that Mohammad was laying the foundation of a powerful organization even in concealment and sending out preachers to different parts of Persia made some efforts to seize, but it would appear that either these efforts were half-hearted or they failed.

Ultimately, 'Abd Allah al-Mehdi in direct line of descent from Mohammad, the son of Isma'il succeeded in laying the foundation of an enviable empire in Egypt, the rulers of which are known to history as the Fatimids or the descendants of Fatima though 'Ali.

At this juncture it is perhaps expedient to state in the most explicit terms that the Carmathians were not associated with the Isma'ilites, nor were they identical with them as it is sometimes wrongly supposed.

Hollister has ascertained their position as follows. "We find the word Carmathian used, (1) as an equivalent for Isma'ilis in general, (2) for the dissident groups of Isma'ilites who joined in the invasion of Syria and came

very close to capturing Damascus and establishing there a Fatimid Kingdom somewhat earlier than that established in North Africa, (3) for the followers of Hamdan Qarmat and ‘Abdan, his brother-in-law, who seceded from the Isma‘ilites, and (4) for the Qarmatians of Bahrain. The more recent studies, support by Isma‘ilite authorities, have made it clear that only this last group is really entitled to the name Qarmatian (Carmathian).”

The Fatimid Caliphs (297 - 567/909 - 1171), broadly speaking, tried to establish a theocratic State and were, on the whole, just rulers and efficient administrators. One of them, al-Hakam, however, claimed divinity for himself. In other words, he not only claimed to be the Imam, but further contended that the divine light had entered his body so that he had become identical with the Creator. His claim was laughed out of Egypt, but the Druze of Lebanon up to this day believe in his divinity and look forward to the return confident that he merely disappeared as an Imam often does, and would reappear in due course as the herald of a new era of prosperity, righteousness, and godliness on Earth.

Amazingly enough, the Isma‘ilites were destined to be split again into two powerful groups. Al-Mustansir died in 428/1036 and the Imamate should have been transferred to his eldest son Nizar who, his supporters claimed, had been properly designated as Imam. However, he was not in Cairo when his father died, and before he could take effective steps, his brother al-Musta‘li, ascended the throne and Nizar was faced with a fait accompli.

Nizar never succeeded to the throne, but he found a very staunch supporter in Hassan Sabbah who had come to Persia during the reign of al-Mustansir. This Hassan Sabbah was really an amazing person, learned, erudite, ambitious, outwardly pious, wily, and blessed with administrative ability and infinite capacity to work.

In order to further his own ends, he supported the cause of Nizar as the rightful Imam and the ruler of the Islamic world, and in his name took possession of many fortresses in Persia, including the famous Alamut (the Eagle’s Nest), which, in due course of time became the centre of Hassan’s activities.

The movement initiated by Hassan is known as Da‘wat-i Jadid or New Propaganda. The Nizaari Imams of Alamut, beginning with Hassan Sabbah, held sway in certain parts of Persia until the last Imam Khurshah was killed by the Mongols in the seventh/13th century. The Nizari branch of the Isma‘ilites recognizes the Agha Khan as its head and their members are known in the Indo-Pakistan sub-continent as Khojas. The adherents of Must‘li are known as Bohras.

According to the Isma‘ilites as to the Orthodox Shi‘ites, the only rightful State is a theocratic one which has as its Head the Imam who, as we have already emphasized, is divinely ordained to hold his office.

The Imam of the Head of State never becomes *functus officio* in the sense that when he is concealed his representatives become operative and spread the light. As a matter of fact, both sects, the 12ers and the Isma‘ilites, believe in the continuity of the office of the Imam. There can be no vacuum so far as the performance of the functions pertaining to the Imamate is

concerned. There may be and sometimes a long period between the death of one prophet and the birth of another, but during this period the Imam continues to perform his functions in the light of revelation.

It is believed that every Prophet had an Imam to whom he revealed the truth. Technically, the Prophet is called natiq and the Imam as sumit.

It is admitted that, although revelation is only vouchsafed to the prophet, it is interpreted and enforced by the Imam, since the esoteric meanings of the revelation are known to him alone. During the Fatimid period, 'Ali, the fourth Caliph, was given the place of asas or the foundation of the Imamate and was, thus, raised to a position above all other Imams.

In the theocratic State envisaged by the Isma'ilites every Imam has a chief minister who is termed Bab (the door, the gate). He is the intermediary between the Imam and the inner circle of preachers. All information sought to be conveyed to the Imam is conveyed through the Bab and all orders passed by the Imam are communicated to the persons concerned by the same Bab. It is on record that Hassan Sabbah claimed that he had been refused permission to see the Imam on account of the fact that Badr, the Bab, and the minister of Mustansir would not allow him to do so.

The Isma'elite creed emphasizes the importance of cycles. Obviously, one source of revelation is not sufficient to lead humanity to the true path. Therefore, there have been cycles of revelations, each introduced by a prophet or natiq succeeded by six Imams. The seventh initiates a new cycle and really ranks as a prophet.

This is the reason why Isma'il is held in such reverence by the Isma'ilites: he completes the cycle which began with Prophet Mohammad and introduces a new one.

Salvation of mankind depends upon recognizing the basic principle that must identify the Imam and take the oath of allegiance (bai'ah) to him. Those who do not recognize the Imam remain in a state of sin.

It has been mentioned that the Shi'ites believe in the doctrine of the sinlessness of the Imam. It has also been stated that Isma'ilites, more than any other Shi'ite sect, accept unflinchingly the conclusions which are attendant upon this belief. In other words, if it be proved beyond any shadow of doubt by unimpeachable evidence that Isma'il was observed drinking wine, the Isma'ilites would argue that since the Imam is incapable of committing a sin his wine-drinking must be considered to be an act which is capable of an esoteric interpretation (ta'wil).

As a matter of fact, the basis of the Isma'elite creed, as it crystallized under Fatimids of Egypt, is the belief that there are two aspects of knowledge, namely, the apparent or manifest (zahir) and the esoteric or inner (batin). The zahir of the Qur'an is tanzil while the batin is the ta'wil. The exoteric meaning is known to the Prophet who imparts knowledge to his Imam. The Imam then spreads the light through his representatives, "Every person who wishes to belong to the Da'wat enters into covenant with him (the Imam), on behalf of God. This is called bai'ah. Man and woman must both take a like oath in a ceremony known as mithaq. They must quite justly oppose everything that is unlawful...and keep secret those things and the religious knowledge which are entrusted to them. Obedience

to all the dictates of religion is the most important duty of the Faithful. Salvation can be attained only through obedience completed in word, action, desire and thought.”

Whereas the Sunnis and the 12ers (Ithna ‘Ashariyyah) have commentaries relating to the meaning of the Qur’an, the Isma‘ilites do not and cannot possess any such works.

Ivanow has it that in Isma‘ilism there is no such thing as a work of Tafsir (commentary on the Qur’an). It would appear that the passages which seem obscure or ambiguous can only be referred to the Imam and whoever has the good fortune to learn the esoteric meaning from the Imam or his representatives is bound to keep such information confidential and secret on account of the oath of allegiance taken by him.

All subjects of a theocratic State, as envisaged by the Isma‘ilites, therefore, are initiated in the mysteries of religion in accordance with their intelligence, capacity, integrity, and loyalty. It is needless to add that if a subject of this theocratic State breaks the oath of allegiance and becomes a convert to any other religion, he is severely punished (provided he is captured).

Until the Fatimid regime came into power the Isma‘ilites, like other Shi‘ite sects, were anxiously waiting for the advent of the Mehdi who would bring peace and prosperity to the world. After the establishment of the Fatimids, the conception of a personal Mehdi as al-qa‘im was changed. Every Caliph of the Fatimid dynasty was named al-qa‘im and thus “the idea of Mehdi became merged, so to speak, in the Imamate, in the dynasty whose mission comes to include the objects which Mehdi was to effect, if not under an Imam, then under one of his successors.”

The theocratic state of the Isma‘ilites enjoins upon all the subjects to wage a holy war (jihad) against the people “who turn away from religion.” The duty to wage war is obligatory, but it is restricted by an important condition: it can be justified only under the guidance either of the Imam or of his accredited representative.

All subjects of this theocratic State believed in the expediency of dissimulation (taqiyyah) although its necessity was reduced almost to nothingness during the regime of the Fatimids. Still taqiyyah is an accepted fact and whenever the Imam is in concealment, his disciples are obliged to practise it so that they may come to no harm. Before the Fatimid regime, even the Imams themselves, practiced taqiyyah, according to authentic evidence endorsed by the Isma‘ilites.

It has been mentioned that the sect of the 12 as well as the Isma‘ilites believe that the only rightful ruler of all territorial possessions of the world is the Imam. Since at a given moment a theocratic Isma‘ilite State may or may not exist, it is the duty of all Isma‘ilites to encourage the preaching of their creed.

The Fatimids paid great attention to the intellectual equipment of a preacher (da‘i). The da‘i was supposed to answer any question that a student or an opponent might ask. He was, therefore, made to study jurisprudence, all branches of Tradition, the philosophical interpretation of the Qur’an, ta‘wil or allegorical meanings, and the art of controversy and dialectics.

The theocratic State of the Isma'īlites established under the Fatimids encouraged the acquisition of knowledge. In a way, it aimed at rationalization of the precepts of religion. It was by arousing the curiosity of the people that the Isma'īli preachers ultimately succeeded in winning them over. It is paradoxical, indeed, that the Isma'īlites, who believed that mere knowledge is not sufficient for the achievement of salvation and that one has to recognize an Imam and follow unstinted in all matters, established seats of learning, schools and universities where the students were encouraged to think for themselves. The Azhar University of Cairo was built by the Fatimids and has continued since then to be regarded as the outstanding educational institution in the entire Muslim world.

The Fatimids also established observatories and libraries and these institutions were accessible to all peoples and classes irrespective of religion or creed. Public gatherings were addressed by learned men in robes which may be regarded as forerunners of the academic gowns worn by professors today. All costs pertaining to these institutions were borne by the Government and for the teaching of different sciences; learned professors were imported from Spain and from the farthest parts of Asia.

It may be said, therefore, that a theocratic State, rigid in its framework and immutable in its convictions, gave birth to rational movements aimed at the correlation of religious precepts with scientific and philosophic truths as known at the time. It became the harbinger of rational thinking, and by encouraging the pursuit of knowledge it gave to learning and letters a new impetus. If we believe Nasir Khusrau, and we have no reason to disbelieve him, the State which was established by the Fatimids had become the centre of all learning and knowledge and from it radiated waves and movements towards different parts of the Muslim world encouraging others to pursue knowledge, to think for themselves, and to ponder over religious matters in the light reason.

It is an amazing co-incidence of history that a theocratic State should give birth to rational thought and should encourage the study of philosophy even collective mental state which is opposed to the rigidity of a truly theocratic State. The Fatimids deserve all honour, therefore, for advancing the cause of their own State and sealing their own doom.

Chapter 38: Nizam Al-Mulk Tusi

Nizam al-Mulk Tusi was born in 408/1018¹ and died in 485/1092. He was not only a minister of the Saljuqs for the last 30 years of his life, a scholar,² and a patron of arts and sciences, but also the founder³ of the famous university styled after his name the Nizamiyyah.

He lived in an age which witnessed the lowest degradation of the caliphate, following its transformation during a period of three centuries,⁴ from a democracy into an autocracy and from autocracy into a mere puppetry in the hands of powerful masters. That period also saw the fall of the Ghaznawid Empire and the Buwaihid Kingdom, and the rise of the Saljuqs after their victory over the Ghaznawids in 431/1040, when their nomadic life changed into the life of a gigantic empire, extending from the Oxus and Jaxartos to the Bosphorus. It was an age of change and fusion of social and political ideas and institutions, especially in that part of the Muslim world in which Nizam al-Mulk lived and worked.

The rise of the Persian element in political power in the early period of the ‘Abbasids was followed by a gradual revival of the Persian political institutions under the patronage of the Samanids, the Ghaznawids, and then of the Saljuqs. These institutions in their turn, together with their theoretical foundations, came to be assimilated by Muslim thought. For this assimilation, no battle of ideas was ever fought, it came as a process of cultural development in which Nizam al-Mulk stood as one of the representatives of Persian culture, with a bias towards Islamic thought.

Nizam al-Mulk was not really his name. It was a title of honour conferred upon him by his Saljuq master, Alp Arslan, after his appointment as a minister. His name was Abu ‘Ali Hassan, and his father’s name was Abu al-Hassan ‘Ali, who belonged to a family of landowners (dihqans)⁵ of Radhkan,⁶ a small town in the suburb of Tus where Nizam al-Mulk was born. In the days of the Ghaznawids his father was appointed a tax-collector of Tus by Abu al-Fadl Suri, who was the Governor of Khurasan.⁷

His early education started with the study of Tradition (Hadith) and jurisprudence (Fiqh), and as his father wanted him to take up the legal profession for his future career; he was put under the care of ‘Abd al-Samad Funduraji,⁸ who was a profound scholar of Law.⁹

In the famous “Tale of the Three School Fellows,” it is related of him that in his school days in Nishapur, where he was sent to attend the lectures of Imam Muwaffaq, he made friends with two boys, who later became eminent personalities. One was ‘Umar Khayyam, the great poet and astronomer, and the other Hassan b. Sabbab, the founder of the Batiniyyah sect of the Assassins. Research by the late Sayyid Sulaiman Nadawi makes it unnecessary to discuss this controversial point¹⁰ of Nizam al-Mulk’s life. This tale, he proves, is a fabrication.

From what the author of Tarikh-i Baihaqi relates about Nizam’s family on the reliable authority of his grandfather Shaikh al-Islam Amirak, who had seen Nizam al-Mulk in his boyhood, it may be concluded that it was after he had reached the age of maturity and not in his early years, and after his father had been relieved of financial worries¹¹ that he was able to attend Imam Muwaffaq’s lectures in order to complete his higher studies.

His studies over, he travelled to Bukhara and Merv, and to a number of towns¹² in Transoxiana, most probably in search of a post, and after 441/1049¹³ he went to Ghaznah, where he sought service with the Gaznawids, thus getting an opportunity to acquaint himself with their administration. When Sultan ‘Abd al-Rashid was murdered in 444/1052 and the political affairs were upset, he escaped to Balkh and entered the service of ‘Ali b. Shadhan,¹⁴ who was then the governor of that province on behalf of the Saljuq ruler Chaghari Beg Dawud. Annoyed with the habits of this man, who extorted heavy sums from him every year,¹⁵ he fled to Merv.

Once there, Chaghari Beg appointed him the mushir (counsellor) and the katib (secretary)¹⁶ of his son, Alp Arslan. It was on the advice of ‘Ali b. Shadhan¹⁷ that Alp Arslan, after his accession to the throne in 455/1062, raised him to the position of a Joint Minister with ‘Amid al-Mulk Kunduri. But Kunduri was soon deposed and then put to death, it is said,¹⁸ on the advice of Nizam al-Mulk, who had then become the full-fledged Prime Minister of the Saljuq Empire.

He became the real master of the whole realm with the succession of Malik-shah to his father’s throne in 465/1072, which he owed entirely to Nizam al-Mulk’s efforts.¹⁹ From the capital of the Saljuqs, his influence spread to the capital of the ‘Abbasid Caliph, who is said to have dignified him with the title of Radi-u Amir al-Mu’minin, never before conferred on a vizier.²⁰ He had done much to stabilize the power of the Saljuqs, and to improve their administration, and, therefore, when Malik shah once threatened him with dismissal he dare to reply that the kingship was linked with his vizierate.²¹

In his last days, he came into collision with the Isma‘iliyyah movement of Hassan b. Sabbah, in whose activities he saw danger to the Saljuq Empire. He had actually once deputed Abu Muslim Radi to arrest Hassan,²² but Abu Muslim was himself assassinated by one of the fida’is (the Assassins) in 485/1092.

It will be in place here to refer to the two Persian works of Nizam al-Mulk, which are the chief sources for the study of his political ideas: the *Siyasat Nameh* (The Book on State-craft) and the *Dastur al-Wuzara’* (The Conduct of Ministers) or, as it is more generally known, the *Wasaya-i Khuwaja Nizam al-Mulk* (The Precepts of Khuwaja Nizam al-Mulk). He is said to have written yet another work entitled as *Safar Nameh* (The Book of Travels) which is now extinct.²³

Certain changes and additions may have been made to the original text in a later period, but the *Siyasat Nameh* has generally been recognized as the genuine composition of Nizam al-Mulk himself. There has been some controversy among scholars about the authenticity of the *Wasaya* on account of the doubtful “Tale of the Three School Fellows,” which has been set out in detail in the preface of the treatise. There is no need to revive this half a century old controversy²⁴ as it has nothing to do with the study of his political thought.

The *Wasaya* is not claimed to be the composition of Nizam al-Mulk himself in the sense in which the *Siyasat Nameh* is considered to be his work. It was compiled in the ninth/15th²⁵ century by an anonymous person

whose family, as he claims in the preface, descended from Nizam al-Mulk. He compiled it partly from the books and partly from the oral traditions handed down in his own family.²⁶ Therefore, the anecdotes cited in it begin invariably with the phrase, "So says Khuwaja Nizam al-Mulk."

The preface, which is one of the reliable sources of Nizam al-Mulk's life, is evidently from the pen of the compiler. But the other two chapters, which form the main part of the work and contain much valuable material on the political ideas of this famous vizier, are composed from his own authentic writings and utterances. It has been justly remarked²⁷ that there is no internal evidence in the main part of the work to show that it does not owe its contents to his pen. A large part of the *Wasaya* may be regarded as the actual utterances of Nizam al-Mulk.²⁸

We are fortunate in having these two important works of Nizam al-Mulk representing his thoughts about kingship and vizierate, which were the two political institutions of primary importance in his days. The *Siyasat Nameh*, which is the exposition of his theory of kingship, was originally written to serve as a "monarch's primer."²⁹ It is said that in 484/1091³⁰ Sultan Malikshah (r. 465 - 1072/485/1092) instructed some of his dignitaries to think over the state of affairs in his realm and write down the principles of conduct that were followed by monarchs in the past, and were required to be observed by himself.³¹

The treatise of Nizam al-Mulk among the works presented to the Sultan was the only one which he approved of and adopted as a guide (imam).³² But it must not be treated as a mere handbook of day-to-day administration, nor must it be regarded as containing simply practical suggestions for the improvement of an administrative system. It is more than that. It is, in fact, the expression of a realistic political theory which emerges out of an actual political situation, and, therefore, helps us to understand the stage in the development of Muslim polity reached in the fifth/11th century.

The *Wasaya* is the exposition of his theory of vizierate. It consists of the counsels which he is said to have addressed in the "last days of his life,"³³ to his eldest son, Fakhr al-Mulk, who also held the office of vizier under the Saljuq Sultans Barkiyaruq and Sanjuar, and was assassinated, like his father, by a Batini³⁴ in 500/1106.

It is fairly easy to present Nizam al-Mulk as one who largely differs from the past writers of political treatises and from his contemporaries, both in his selection of the political institutions which form the subject matter of his writings, and in his approach to those institutions. The method adopted by him in explaining the principles of State administration throws light on his outlook and about the political situation in his days. His approach and outlook regarding the political problems are, indeed, inter-related.

A modern scholar, author of a pioneer work on Muslim political thought, regards his method as "historical." "If it is possible," he writes, "to label the Khuwaja's method with any particular epithet, it is that his method is, to a large extent, historical."³⁵ He considers it historical because "in nearly every case he proves the truth of a principle which he chooses to propound, on the touchstone of tradition or historical facts, though some of the facts he relates are not chronologically correct."³⁶

But it is in a limited sense that his approach can be regarded as historical. It is true that he makes reiterated references to history. But this is not all that makes the historical method what it really is. This method does not consist exclusively in citing historical instances. That is only a preliminary. The historical method consists basically in drawing conclusions objectively from the study of historical facts. The political maxims which Nizam al-Mulk lays down as the guiding principles for the successful administration of the State, are, in fact, the inductive generalizations from the study of history.

They are, indeed, empirical conclusions drawn from his personal experience of practical politics and from his observation of existing conditions. "No event," he believes, "ever happens to take place in the world which might not have occurred already several times. As one might have read, or known, or heard about the circumstances a particular event had brought in, one can surmise the consequences that would follow it in case it happens to occur again."³⁷

In effect he is arguing that history repeats itself, but instead of proceeding from the past to the present he follows a reverse course when he first draws conclusions from the observation of the conditions around him and then turns them back upon the past. History, for him, is not the solution of problems, but the endorser of pre-conceived solutions. The essence of his approach to the political issue lies in the blood of the historical method and the method of observation. Though not very successful in following the historical method, he may be regarded as the most historically-minded writer on political topics both among his predecessors and his contemporaries.

This treatment of history squares well with the object with which he proceeds to formulate a particular political theory. He is concerned with theorizing those institutions and their principles and problems which had developed into an actual political constitution, resting mainly on the Sultanate (kingship) and the vizierate, and to bring them to their possible perfection by suggesting practical reforms. He makes ample use of the past and contemporary history to give his personal ideas the appearance of historical facts.

The political institutions of which he speaks had real roots in the political life of the peoples who inhabited a large part of the eastern lands of the 'Abbasid Caliphate, mostly non-Arab races. Most of those institutions had existed there long before the Great Saljuqs came to adopt them, and still much earlier than they could find their theoretical exposition in the writings of Nizam al-Mulk. The absolute monarchy, for instance, the office of vizierate, the monarchical form of administration of justice, the feudal system, the order of courtiers, the system of espionage, etc., were the institutions handed down by ancient Persia to the successive generations.

Though modified in some respects under the influence of the new Muslim political theory, those political institutions had, nevertheless, succeeded in preserving much of their original Persian character, and exerting, in their turn, a good deal of influence both on the political thought of the indigenous people even after their conversion to Islam as well as on the political system, largely of Persian origin, that Nizam al-Mulk seeks to

set out. This makes us look upon his writings as the earliest exposition of what may be called the Persian political theory.

Side by side with this political theory, but with different notions and with a different approach to political problems, there existed the constitutional theory of the Arab jurists of whom Mawardi³⁸ (c. 364/974 - 450/1058), the author of the *Ahkam al-Sultaniyyah*, was the most eminent. Among this small group of jurists mention must be made of Abu Ya'la (380/990 - 450/1066), a contemporary of Mawardi, and author of another *Ahkam al-Sultaniyyah*,³⁹ and of Imam al-Haramain al-Juwaini (419/1028 - 478/1085), an intimate friend⁴⁰ of Nizam al-Mulk, whose treatise *Ghiyath al-Umam*⁴¹ has not yet seen the light of day. (As political thinkers, the two have not yet been properly studied by students of the history of Muslim constitutional theory.⁴²)

While the Persian political theory attempts to throw light on the sovereign powers of the king, by analysing the institutions characteristic of this royal office, the constitutional theory puts forward the doctrine of Caliphate. It will be in place here to look into the general nature of the juristic approach to the political problems, and more especially to the institution of kingship, which Nizam al-Mulk also treats, with even greater interest. This will help us to appreciate the realistic element in his thought and approach.

In the first instance, these two sets of contemporary theories, one of the jurists and the other of an administrator, differ in their subject matter. A comparison of the contents of the two treatises of Nizam al-Mulk with those, for example, of the *Ahkam al-Sultaniyyah* of Mawardi, would hardly make one regard the two writers as dealing with the problem and institutions of the same political community living in the same age.

Of the office of the Khalifah, his powers and qualifications, the method of his election, the division of vizierate between the unlimited vizierate (*wizarat tanfidh*), the legal difference between their powers, the economic institutions of *jizyah* (poll tax), *zakat* (tax on the accumulated property), *fai'* (goods taken from non-believers), *kharaj* (land tax), and of so many other institutions of religio-political character, which from the chapter heads of the *Ahkam al-Sultaniyyah*, the author of the *Siyasat Nameh* and the *Wasaya* makes no mention at all, and, likewise, most of the topics discussed by Nizam al-Mulk have been avoided by Mawardi and other jurists, except the offices of the Sultan and vizier, which they treat on a different plane of thought. In their constitutional theory, the Sultan occupies a position which is quite different from what he actually enjoyed in the political set-up of those days.

To treat the Sultan as a governor by usurpation (*amir bi al-istila*) is to bring him down to the position of the other provincial governors appointed by the Caliph. This amounts to arguing, as they seem to do, that the Sultan did actually derive his powers from the "Imperial" authority of the Caliph. They leave actual facts out of account by putting the main emphasis on the formal legitimization of the Sultan's authority by the Khalifah, which was but an insignificant aspect of their mutual relations. In doing so, they are apt

to lose sight of his sovereign powers, which he enjoyed independently of the Caliph's assent.

This limitation of the juristic approach to contemporary politics was bound to arise from the fact that its exponents were building their argument on the foundations of the political order of the Caliphate, which had ceased to exist as a real force for about 200 years. Deprived of any real power to shape the political life of Muslims, the Caliphate, as a political system, continued to exist in theory, which found its elaborate exposition in the writings of the juristic school of the fifth/11th century.

But by interpreting the political fiction of the Caliphate in terms of political realities of their times, these jurists, regardless of the actual facts, were indoctrinating the people with the belief that the caliph was still the real source of all authority.

They were, thus, unable to appreciate the fact that it was the autocratic rule of the independent prince, and not that of the 'Abbasid Caliph, under which the people had actually been living, and they failed to see that by legitimizing the authority of the Sultan, the Caliph only recognized his de facto sovereignty, and that this in practice did not render him sub-ordinate to the Caliph. Their juristic theory could not take into full account the growth of absolute monarchy in the Muslim polity upon which a formidable political structure had come to rest.

It is this monarchical system of government developing under the aristocratic rule of the prince, as against the constitutional structure of the Caliphate, which Nizam al-Mulk attempts to study. His political theory represents a particular phase of the development of the Muslim polity which was characterized by kingship. As such, it is an essential part of his contribution to Muslim political thought.

The first thing remarkable about his exposition of the institution of kingship is that he is careful to make no reference to the Khalifah as the head of the Muslim community, and to say nothing about the constitutional relations of the Saljuq ruler with the 'Abbasid Caliph. He rarely uses the title of Sultan for the Saljuq King,⁴³ and as for the term *amir muslauli* (governor by usurpation), it does not occur at all through his writings, both being the terms of the constitutional law employed by the jurists to denote the legal superiority of the caliph over the prince. Instead, he generally calls his ruler *padshah* - a Persian term for the king. All this may reasonably be taken as a conscious effort on the part of Nizam al-Mulk to avoid any discussion or even a phrase which might involve any reference to the legal relations of the Caliph and the prince, for his object in studying the monarchical constitution of the Saljuq Empire is to represent his royal master in his full independent position.

To this political objective his *Siyasat Nameh* was expressly dedicated, for it was composed at the instance of the great Saljuq ruler, Malik-shah, as the *Ahkam al-Sultaniyyah*, the earliest treatise on the constitutional theory of the Caliphate had been written by Mawardi only 40 years before at the instance of an 'Abbasid Caliph⁴⁴ to vindicate his claim to sovereign authority. This indicates the existence of a theoretical conflict between the

powers of the Caliph and the king, which of course has been prompted by the historical events which preceded it.

Conscious of the growing weakness of the Buwaihid dynasty in the beginning of the fifth/11th century, the 'Abbasid Caliph Qadir (381/991 - 422/1031) and his successor Qa'im (422/1031 - 407/1075), during whose rules the juristic theory of the Caliphate was formulated, attempted to achieve independence from the tutelage of the Buwaihids.⁴⁵ On the other hand, the Saljuqs, too, who had succeeded both the Buwaihids and the Ghaznawids after over-throwing their power, were no less keen to assert the authority they had established at the point of the sword.

In spite of acknowledging the nominal authority of the Khalifah,⁴⁶ who, in turn, had legitimized their rule and conferred upon them titles of honour,⁴⁷ the Saljuqs did not hesitate to inflict humiliation upon him whenever it was demanded by the political situation. Kunduri, the vizier of Tughril Beg (d. 455/1062), is said to have with-held the pension of the Caliph on his refusal to marry his daughter to the Suljuq prince.⁴⁸ On another occasion, Malik shah is said to have intended to banish the Caliph al-Muqtadi from Baghdad.⁴⁹

Under this situation it was not possible for Nizam al-Mulk to make any mention of the Khalifah without recognizing him as the supreme authority over his Saljuq prince. This would have been inconsistent with the objective he had in mind in writing his treatise.

His effort to avoid any discussion of the legal or political relations of the Caliph and the king is significant. He is seeking to defend his prince against the theoretical encroachment on his independent position by the advocates of the Caliph's authority.

From the outset Nizam al-Mulk seems to have taken it for granted that the real source from which the king derives his authority, in theory or in practice, is not the institution of the Caliphate. That point has been removed from the plan of discussion. The reason is not far to seek. As it was inconsistent with his political ends to recognize the Caliph as the supreme authority, so an explicit refutation of his claims in this respect would have made Nizam al-Mulk unnecessarily provoke a controversy about the powers of the two offices. To this dilemma he finds a solution in what may be called in modern language the theory of divine right - the theory that the king enjoys the right to rule over his subjects by virtue of divine appointment.

This becomes obvious from the study of the first chapters in the *Siyasat Nameh*, which mainly explain the divine nature of this institution, and its functions ordained by God. He puts it in very clear words when he says, "In every age God selects one from amongst mankind and adorns him with princely skills, and entrusts him with the affairs of the world and the comfort of the subjects."⁵⁰ This is the remarkably simplified hypothesis of his theory of kingship; he does not argue to prove it, but simply states it as a self-evident truth.

This proposition, as advanced by Nizam al-Mulk, suffers theological weakness common to all the expositions of the divine right theory which set out this hypothesis as a *fait accompli*, to be simply accepted rather than to

be argued. It is indeed a dogmatic belief rather than a rational proposition. It is, however, important for our purpose, because it serves to explain how Nizam al-Mulk comes to expound a political theory which is out and out a vindication of autocracy, and how he is led from the outset to reject the democratic principles and enunciated by the advocates of the Caliphate.

After explaining the nature of the king's appointment, Nizam al-Mulk discusses the purposes of kingship in a political community. He argues the *raison d'être* of this institution, and throws more light on its divine nature. The essential function which the king has to fulfil in human society is to bring order of chaos, and to maintain peace and justice. This is what he means when he says, "If the people show any sign of disobedience or contempt towards the Shari'ah (the Canon-Law), or if they fail to obey God and to comply with His commands, then he intends to inflict punishment on them for their conduct...Due to their sin they bring this wrath upon themselves.

Benevolent kinds disappear from amongst them. Swords are drawn and blood-shed follows, and whosoever is powerful does as he pleases, until the sinners to one of the people whom God by His grace blesses with success according to his worth, and endows with wisdom and knowledge.⁵¹

Then Nizam al-Mulk goes on to say that the ultimate object to which the king should direct his efforts is to create and maintain wholesome conditions so "that the people may live with comfort under the shadow of his justice."⁵²

It amounts to a sort of "mystical" interpretation of historical changes, bringing about the rise and fall of rulers. The king has been represented here as an instrument of God's will, fulfilling a divine function in political upheavals. It is the punishment for their disobedience that people are first deprived by the Almighty of the benevolent king. Then His wrath takes the shape of calamities and upheavals. And it is again by His mercy that a man rises to the position of a sovereign and brings about peace and order. Thus, in this divine order of political society all things proceed from God's will, and it is from His supreme authority that the king derives his powers.

While speaking of the monarch who succeeds in establishing his rule by subduing the warring elements and in executing God's will by bringing peace and tranquility to the people, Nizam al-Mulk is not unmindful of the victorious career of the Saljuq dynasty, which had risen to sovereign position by its own strength and successfully established an orderly government. This becomes clear when he says that it is by divine providence that his Saljuq master has been destined to rule his subjects.⁵³

This implies that the king's authority rests, in the first place, on direct authorization from God and, in the second place, on his own ability to gain political power in which he is helped by God the Almighty. He is equally emphatic on the principle of hereditary kingship, which is always an essential part of the divine right doctrine. According to him, the kingly office is essentially of divine origin as well as hereditary, and should pass, like the kingship in ancient Persia, from father to son.⁵⁴ And it is according to this principle that his Saljuq prince, he claims, has inherited this dignified office from his great ancestors.⁵⁵

Nizam al-Mulk's vindication of the claims of the king to sovereign powers is based on a three-fold justification, namely, the divine sanction, the conquest of power, and the hereditary succession. He later states this more clearly in an anecdote in which Nushirwan, the Persian King, has been shown as asserting his eligibility to the throne in a royal speech addressed to his feudatories, "First, this kingship has been bestowed upon me by God the Almighty, secondly, I have inherited it from my father, thirdly,...I have recaptured the kingdom by the sword."⁵⁶

It is obvious now that in explaining the nature of the supreme authority in the political community, he takes the position of a legitimist" who believes not in human choice, but in divine appointment and hereditary succession.

This exposition of kingship is significant from yet another point of view. There is more in it than the mere explanation of the divine origin of the king's powers. It may be regarded as an effort of Nizam al-Mulk to seek moral justification for the passive obedience which the monarch has the right to demand from his subjects, and also for his unlimited authority to control the administration and political life of the people. The two are correlative to each other and follow as corollaries from this legitimist doctrine. This helps us to understand the relation between ruler and subjects as envisaged in his political theory.

He lays great emphasis on obedience as the most essential duty of the people towards the ruler, since he brings to them peace and prosperity after they have been deprived of it as a punishment for their disobedience to God. This has been stated more explicitly in another work, the *Wasaya*, in which he discusses the question of obedience to royal authority. "No doubt," he says, "it is but obligatory to worship the Almighty, and to obey the king. The common people generally, and the royal favourites and courtiers particularly are under the obligation of such obedience, and more especially one who has been entrusted with authority in the matters of administration and finance."⁵⁷

The king is entitled to receive obedience from his subjects as a divinely appointed authority. Nizam al-Mulk asserts that the very fact that the king succeeds in establishing his rule is sufficient to make us regard his authority as resting on the divine sanction. Without the aid of God Almighty," he argues, "an individual can never become a ruler, nor can he bring the world into the bondage of subjugation. Though there might be several causes of his rise to political power, they all refer undoubtedly to the same divine help."⁵⁸

The gist of this remarkably simplified contention is that it is the duty of the people to obey the prince without questioning the validity of his authority: it is valid as *de facto*. A *de facto* ruler may be unjust and may put the country into disorder, but Nizam al-Mulk, like a true legitimist, is careful to avoid this question as it ultimately involves the right of the people to resist a ruler who is doing wrong to them. If confusion and disorder ever take place in a political society, he attempts to interpret it as resulting not from the misrule of the monarch but from the sinful acts of the people themselves.

It is, therefore, by remaining obedient to the king that they can enjoy peace and prosperity which is restored to them under his rule. The king can rightly inflict punishment upon those who, “not realizing the value of security and comfort,” might revolt against his authority.⁵⁹ There is no doubt that Nizam al-Mulk believes in the principle of passive and unconditional obedience on the part of the people, and leaves them without any moral right to resist the royal authority.

A political theory like this, with the belief in the divine appointment of the king, coupled with the principle of passive obedience by the people, can result only in the advocacy of absolute monarchy. The prince of whom Nizam al-Mulk is speaking here is surely an absolute monarch in that his powers are unrestricted by any human power. The only authority which could claim, at least in theory, a certain amount of legal right to impose any obligations on a Muslim prince as the ‘Abbasid Caliph, to whom, we have seen Nizam al-Mulk avoids making any reference in this respect.

It is obvious from his attempt to explain the administrative system with constant reference to the royal office that the monarch is the sovereign authority in his realm, and, as such, is the source of all political power, all are sub-ordinate to him, and are endowed by him with powers and privileges according to their capability. In spite of representing the king as directly responsible for the welfare of the whole country, Nizam al-Mulk does not regard him as accountable to the people for his political conduct. On the question of the kings’ responsibility in public affairs he seems to take again the position of the people, but before God. That, however, has not been laid down expressly, and has to be concluded only indirectly from the statements in which, for example, he says that on the Day of Judgment the king will be summoned before God to answer for his conduct towards his subjects,⁶⁰ and that the government officials are accountable to the king, and the king in his turn is responsible to the Almighty.⁶¹

What Nizam al-Mulk is attempting to set out here is indeed the concept of absolute monarchy. At this point he comes much nearer to the Persian idea of kingship and the Shi’ite doctrine of imamah (the leadership of political community), both founded on the divine right of the Head of the State, than to the constitutional theory of the Sunni Arab jurists, which was based on democratic principles. An absolute monarch claiming direct authorization from God to manage the affairs of a political society was an idea quite foreign to Arab thinkers. The Khalifah had always been regarded by them, at least in theory, as an elected functionary⁶² to whom powers were delegated, not directly by God, but by the electors. They, therefore, held that the Khalifah was subject to certain legal restrictions. This democratic idea of Caliphate is in striking contrast with the Persian notion of absolute monarchy revived in Nizam al-Mulk’s political theory.

It would not be wrong to suppose that this concept of a divinely appointed ruler came to him mainly from the political system of ancient Persia, and not from the contemporary Shi’ite doctrine,⁶³ which, as systematically evolved under the Fatimid rule in Egypt, was definitely a much later development in comparison with the Persian concept. This is obvious from his repeated references to the political principle on which the

monarchical constitution in ancient Persia was based, but he makes no such references to the political ideas of the Shi'ites, of whose political activities in the form of Batini movement he is, on the contrary, vehemently critical.⁶⁴ But it must be admitted at the same time that his exposition of divine right is lacking both in philosophical depth and systematic treatment with which this doctrine was set out in the Fatimid dogmatics.

The reason for imitating the Persian model of kingship is to be sought in his contemporary historical conditions. On the one hand, he is expressing, as pointed out before, the popular idea of kingship prevailing in the territories conquered by the Saljuqs, and, on the other hand, he is seeking to replace the Turkish concept of tribal leadership by the Persian ideal of absolute monarchy.

The peculiar conditions under which he had to work out his political theory, made the adoption of autocratic rule inevitable. The institution of Khanat, that is, the tribal leadership among the Saljuqs, had largely become inconsistent with the stage of political power under tribal customs, their Khan was far from having any territorial basis for his authority, with the result that their tribal system of government was found inadequate to cope with the problems of the large territorial empire which they had come to rule. The Empire they had inherited from the Ghaznawids and the Buwaihids was far vaster than the territory hitherto known to them, and more advanced in political principles as compared with their own tribal customs. Despite the large powers that were conferred upon the Khan by the tribal system, he was regarded much more the leader of a large tribe, than as a sovereign in the proper sense.

There were other "minor leaders" of small groups of families who, at least in the early stage of their political career, could lay claim to political power derived not from the "major" tribal leader but from the tribal customary law. It was not until the reign of Malik shah, the third ruler of the great Saljuq dynasty, that the Saljuq prince could become a real autocratic mind⁶⁵ in all State affairs throughout the reign of Alp Arslan and Malik shah, who was mainly responsible for altering their nomadic tribal political organization to harmonize with the requirements of a territorial empire. He converted their power into a centralized autocratic authority essential for successful government in his time.

What he is attempting now in his writings by theorizing about kingship and its institutional organization is to provide the Saljuq monarchy with a theoretical basis. He is seeking, moreover, to shape it on the model of Persian kingship about which he had read in the "works of the ancients" (kutub-i pishinagan),⁶⁶ and had seen revived in the monarchical constitution of the Ghaznawids. To him this Persian monarchy, with its autocratic principles, was more adaptable to the new circumstances than any other type of institution which was founded on democratic principles.

Only an absolute monarchy, he thinks, can vigorously deal with the nomad Turkumans and the petit leaders of the Ghuzz tribes in subduing their power to a centralized authority. Therefore, he advises his prince that "God Almighty has created the king most powerful of all people, and all are sub-ordinate to him. It is from that they take their subsistence money and

their position. He should treat them in such a way that they always realize their position, and may not throw off the bondage of allegiance, and, moreover, they should not be allowed to do whatever they like; they should do only what they have been ordered to do.”⁶⁷ His aim in stressing the absolute superiority of the king is to introduce a central authority with autocratic powers in the political system of the Saljuqs, the majority of whom were not yet fully accustomed to this principle of government and administration.

To imitate the Persian absolute monarchy was also useful in tackling the problems of the growing “feudal system” in the Saljuq Empire. The Persian institution of kingship had a record of feudal traditions, and could furnish the Saljuqs with the laws applicable in many respects to their relation with the feudatories and the subjects.

The system of land assignment - what Nizam al-Mulk calls the *iqta‘ dari*⁶⁸ - may be regarded undoubtedly as the Eastern form of feudalism as against the feudalism of medieval Europe. To a great extent, Nizam al-Mulk may be considered responsible for developing, if not for introducing, it on systematic lines within the political structure of the Saljuq Empire. It was due to the military organization of the Saljuqs, on which their political structure ultimately came to rest, together with the problems of revenue administration, that the practice of assigning fiefs (*iqta‘ s*) to the military chiefs, soldiers, and to other private persons was adopted. There were also the *dihqans*, the old Persian land-owners, who continued to exercise proprietary rights as before. This system, in brief, was designed as a means of paying the soldiers and of collecting revenues.

The principles on which Nizam al-Mulk suggests that the *iqta‘ dari* should be based develop it into a feudal system very different from the Western feudalism, both in character and in social and political consequences. It is basically different in the tenure of the feudatories, in their legal rights over the land and the *ra‘iyyah* (vassals) as well as in the relation of the king as the over-lord with the *muqta‘ s* (feudatories), on the one hand, and with the subjects, on the other, and with the subjects, strictly hereditary as a general rule. There is nothing in his writing to suggest that he is in favour of assigning lands to an individual with a specified legal right to transmit it by inheritance.

On the other hand, in his system the feudatories come to occupy a position more akin to that of the tax-collectors with large administrative powers than that of the “feudal lords,” in the medieval sense. In their relations with the vassals they are like the *shihnahs* (guards, and in case a feudatory fails to treat them well, “the fief, it is suggested, must be withdrawn from him.”⁶⁹ Besides, “the officials and the feudatories must be changed every two to three years so that they may not get strong enough in their fortifications.”⁷⁰

It appears that side by side with developing the *iqta‘* system, Nizam al-Mulk attempts to enlarge the powers of the king as a means of checking the centrifugal tendencies which tend to appear in feudalism. This leads him to put forward a theory of land ownership which goes well with his idea of absolute monarchy. He holds that “the feudatories who hold the fiefs must

know that civility and courtesy the lawful amount which has been assigned to them, i.e., to the feudatories, and when that has been taken, the subjects shall be secure in their persons, property, wives, and children, and in their goods and estates....They must know that the land and the subjects all belong to the king, and the feudatories and the governors (walis), set over their head, are like the guards to the subjects, as the king is to others.”⁷¹

In entertaining such a view regarding land ownership, Nizam al-Mulk departs from what may be regarded as the Islamic theory, which attributes the absolute ownership of land, not to the Head of the State, but to the State itself, as entrusted to by God. It is also a clear departure from the traditional concept of the Ghuzz tribes, who looked upon the land that they would come to occupy as the common property of their families. It was this tribal concept of land ownership of Nizam al-Mulk was seeking to modify basically, as it was out of tune with the administrative principle of a centralized empire which had now passed into their hands. To him it was essential to bring both the land and the subjects under the central authority of the king.

A good deal of his theory, it appears, has come to him from the old feudal Persia. This is evident from his attempt to explain this principle by an anecdote from Persian history in which the famous vizier Buzurjmihr has been represented as advising Nushirwan that “the kingdom (wilayah) belongs to the king (malik), and the king has entrusted the dominion, and not the subjects, to the military. When the military is not well wishing unto the kingdom, and kind to the people...and takes the power to arrest and imprison...and to appoint and dismiss, what difference then remains between the king and the military, for that power really belongs to the king, and not to the military.”⁷² On another occasion Nushirwan exhorts his feudatories to treat the people well, and only to take from them what is due and just, and he stresses the fact that the dominion belongs to him, and it is by him that the estates have been assigned to them.⁷³

Nizam al-Mulk’s feudal theory takes away much of the powers from the hands of feudal lords which they enjoyed, for instance, in Western feudalism. It leaves them with limited power to collect the revenues, and to have only “a fixed amount in their hands.”⁷⁴ Moreover, it removes them from the position of being the sole intermediaries between the king and the subjects, preventing the latter from getting into direct contact with him.⁷⁵ In his system, the direct responsibility for the well-being of the subjects rests not with the feudatories, but with the king, and, therefore, he suggests that the king should send spies (jasusan) and special confidants (khwās)⁷⁶ to inquire secretly about administration in the fiefs in order to get reliable information about the condition of the subjects, and urges him to dismiss a feudatory who forbids subjects to represent their cases to the king in order to seek redress for grievances.⁷⁷

All this results in the concentration of all the political administrative powers, as sought by Nizam al-Mulk, in the central authority of the king which was once enjoyed by the Persian autocrat.

Though his idea of kingship is in essence of Persian origin, it differs in certain respects from the Old Persian prototype, and has been refashioned in

other respects under the influence of Muslim political theory and practice. It is, on the whole, an attempt to readjust the Persian model with the contemporary social and political structure.

The most important point of difference is that Nizam al-Mulk is not an incarnationist. Unlike the ancients who could look upon their Persian monarch as the incarnation of Divinity,⁷⁸ he treats his ruler as a simple human being. In spite of once calling the prince the “shadow of God on earth” (zill Allah fi al-ard) in the Wasaya⁷⁹ - a phrase which does not occur at all in the Siyasat Nameh - he does not go the extent of clothing him with divine attributes so as to make him appear an embodiment of Divinity. The phrase is devoid here of any mystical meanings, and has been used in the ordinary sense of a metaphor, to mean that the exalted office of the king is like a shadow provided by God on earth under which mankind may find peace and security. No doubt, he speaks of this monarch as “adorned with the virtues and excellences which were lacking by kings all over the world,”⁸⁰ yet there is in him no tendency to regard the king as a super-human being in any metaphysical sense. Among those excellent virtues with which his prince is adorned, he counts, for example, good appearance, justice, courage, generosity, etc.⁸¹ but they are all divinely gifted qualities, not divine attributes. Therefore, his prince is by no means an incarnation of God.

Far from attaching any “mystical” or metaphysical sense to the concept of kingship, he believes that “the king is endowed by God with wisdom and knowledge so that he can treat each of his subjects according to his worth and can give each a position according to his value,”⁸² and, again, “His (i.e. the king’s) wisdom is just like a lamp that gives off abundant light. People can find their way in its light and can come out of darkness,⁸³ and he does not need himself to be guided by others.” We can see his prince bearing a small resemblance both to the philosopher-king⁸⁴ and to the Shi‘ite teacher-Imam,⁸⁵ but suffering from an innate inability to become the true image of either. This seems mainly due to the fact that Nizam al-Mulk is by temperament much more a matter-of-fact exponent of popular ideas than a real philosopher, unable to develop his thoughts into philosophical concepts. He may be taken as possibly expressing a general belief about kingship prevailing in his days, in which the old Persian idea of the divinely-appointed monarch in its moderate form - and not the concept of divine monarch - was superficially inter-mingled with the Neo-Platonic interpretation of the philosopher-king as an embodiment of perfect wisdom. His concept of the king is that of a statesman who is primarily concerned with general beliefs rather than with philosophical generalizations.

His Persian ideal is modified also in another respect, obviously under the direct influence of Muslim thought. Though he treats his prince as a divinely-appointed ruler, invested with unlimited powers, he does not regard him by any means as a law-giver. A human authority with absolute legislative powers has never existed in Muslim polity, because legislation in the proper sense of the term has never been recognized as a human function in the Muslim legal theory. According to this theory, there does already exist a divine Law (Shari‘ah) supreme, eternal, and perfect, which is

theoretically as binding on the ruler himself, however autocratic he may be in practice, as on his subjects. This is what seems to have prevented Nizam al-Mulk from attributing any legislative power to his prince. His king, on the other hand, is subject to the supreme Law of God, and, is, moreover, an instrument for enforcing that law, and for making people abide by it. He emphasizes that it is obligatory for the king to seek knowledge of religion matters and to comply with, and make arrangements to carry out the commands of God and the traditions of the Prophet, and to pay respect to religious scholars.”⁸⁶ Therefore, it is the duty of the ruler to appoint judges (qadis) to execute the Shari‘ah as his deputies (na‘ibin).

This discussion of the ruler’s responsibility in enforcing the Shari‘ah, apart from explaining a principle of Muslim policy, is also interesting for its historical significance in respect of the Saljuqs. This shows Nizam al-Mulk’s attempt to teach the Saljuqs the principles of the Muslim legal system and to familiarize them with the law of the more civilized people of whom they had become the rulers. But his royal masters were altogether strangers to all culture,⁸⁷ and there is no reliable information to prove that they could even read and write. Therefore, books, as the direct source of knowledge of religious Law, were out of their reach. This seems to be the reason why Nizam al-Mulk advises his prince to get himself acquainted with the teachings of religion through the debates of the scholars (‘ulama’) which he should caused to be held occasionally in his presence, once or twice a week. “Thus, one day he will become conversant with most of the laws of the Shari‘ah, the commentary of the Qur’an and the traditions of the Prophet and, thus, the methods of dealing with temporal and religious affairs would become easy for him.”⁸⁸

This discussion leads us at this point to another important question, namely, the place that religion must have, according to Nizam al-Mulk, both in the conduct of a ruler and in the political life of a people, where we can see again that his concept of kingship is modified by the influence of Muslim thought. In spite of his love for the political principles for pre-Islamic Persia, he is essentially a religious-minded man who can believe only in the religious values of social life and enunciated by Islam, and can look upon a political community as dedicated out and out to religious ends. His political theory is made up of reconciliation between the Old Persian ideals and the Muslim political ideology.

To him, in the first place, religion and politics are inseparably joined together and, as such are complementary to each other. “The State (and kingship) and religion,” he believes, “are like two brothers.”⁸⁹ And throughout his writings, the two have been treated in the same spirit. In dealing with them, he closely follows the spirit of Muslim polity which is largely based on the concept of the indivisible unity of religion and politics.

The principles of conduct which he lays down for his king under the influence of this religious trend are in striking contrast with those prescribed by Machiavelli for his prince. Unlike the Machiavellian prince who is advised to handle religion merely as a useful instrument for achieving political ends, and who is taught to appear rather than become religious,⁹⁰ Nizam al-Mulk’s prince is taught to believe sincerely in religious truths, and

to exercise political power as an essential means of attaining them. According to him, both the State and religion are dependent upon each other for their existence; therefore, the king must treat them both alike. “Whenever there is any disorder in the state,” says Nizam al-Mulk, “there is confusion in the religion of its people also, and the heretics and mischief-makers make their appearance. And whenever religious affairs are disturbed, the State is thrown into disorder, the mischief makers grow strong, and heresy makes itself manifest.”⁹¹ He believes that “the most virtuous thing for the king is to uphold the right faith.”⁹² To him a wise and just ruler is one who follows the tenets of religion faithfully, and eradicates heresy from his realm.⁹³

It is obvious that the concern of his prince with religion is not mere politics; it is rather a matter of genuine faith in the religious values of social life. It is an instrument to preserve the State as well as a means of salvation in the life to come.⁹⁴ “The ruler who strives to uphold the faith successfully is entrusted by God with temporal and religious affairs, and his wishes are granted in both worlds.”⁹⁵

This shows how Nizam al-Mulk is at pains to make his prince a religious as well as mundane authority. It is, however, no artificiality with him to blend the religious and temporal powers in one and the same office. With a religious man like him, looking to faith for guidance in the spiritual as well as in the worldly affairs, it is more natural to combine them than to treat them as separate. Besides his own outlook about the relation of religion and politics, which led him to attribute religious function to kingship, there arose a historical situation in which the king came to be regarded not only as a temporal authority but also as a religious functionary. The age of the Caliph, when he was the undisputed leader of the Muslim community, had practically come to a close by this time, giving rise to the power of the independent autocratic monarch to whom the people now looked for leadership, there arose a historical situation in which the king came to be regarded not only as a temporal authority but also as a religious functionary.

The age of the Caliph, when he was the undisputed leader of the Muslim community, had practically come to a close by this time, giving rise to the power of the independent autocratic monarch to whom the people now looked for leadership in all temporal and religious affairs. It will not help much towards appreciating the role this autocrat came to play in the social life of the Muslim people, to suppose about this historical change that, “politically, the Khalifah gave place to the Sultan, that is, a religious executive was replaced by and explicitly independent mundane power.”⁹⁶ It must be admitted that the Muslim world, far from thinking in terms of the separation of State and religion, was definitely at a stage of political development in which, as we have seen, it could still easily believe in their ultimate oneness. The Caliph, therefore, was not held to be simply a religious executive; he was a temporal authority as well, and both functions were intricately inter-woven in his office.

The autocratic prince, who came to fill the void left by the Caliph in the Muslim life with the latter’s downfall, was his heir in both capacities. He was a replica of the Caliph, in almost every respect, save that, like the

Caliph, he was not an elected functionary, and therefore, unlike him, he was in practice an absolute sovereign with no constitutional limitations on his authority, and under no constitutional obligation even in fulfilling his religious functions. Had he been regarded as simply a mundane power, the Muslims living under his rule would have been left without a leader to organize their religious life, especially after the Caliph had practically been removed as a real force from the scene of their spiritual and political life.

It is this practical necessity that has led Nizam al-Mulk to insist on the essentially religious character of the king's authority. This special emphasis on the religious character is also important on account of the fact that it tones down the autocratic temper of his monarch. The moral obligations he sets on the absolute authority of the king prevent it from growing into an oppressive despotism. His is basically the idea of a paternalistic State in which the king is held responsible for the security and well-being of all subjects. The first and foremost moral obligation of the king towards his subjects is to do justice. He believes it to be a religious duty, for it has been ordained by God.

Justice, as a principle of good government, occupies a pre-dominant place in his concept of kingship, and time and again he lays emphasis on its importance for State and society. But, in spite of all its significance, he does not attempt to formulate any systematic theory of justice, nor does he make any effort to define it exactly. This much, however, can be concluded from his statement that, like almost all his ideas, justice, too, is a practical maxim or a social rule rather than a social philosophy. Everyone should be given what is due to him, or what has been legally recognized as his right in a given social order. To him justice is a moral principle which is also usable as an effective means to preserve a political society and to promote peace and prosperity among the people. "The kings should strive," he says, "to seek the favour of God, which can be attained through the kindness with which they treat the people and through justice which they administer to them. When the people pray to the welfare of the king, his State grows stable and prospers ever day."⁹⁷

To stress its significance for the prosperity of the State he quotes the saying that "a State can continue to exist notwithstanding impiety, but it cannot exist with tyranny."⁹⁸ Therefore, he believes that an auspicious age is one in which a prince comes to rule.⁹⁹ He quotes several anecdotes from history to demonstrate the material advantages of justice, and to show that justice is the outstanding moral virtue of a king. He lays equal emphasis on its moral and material aspects as inseparably joined together, and stresses the point that as justice brings prosperity and good reputation in this world, it helps a ruler "to attain salvation in the next world."¹⁰⁰

In his notion of justice he is influenced again both by Islam and by Persia. It is under the Islamic influence that he comes to realize the religious and moral significance of justice, and goes to the extent of linking its worldly aspect with the deliverance of the soul and eternity. To illustrate this point he quotes from the Holy Qur'an,¹⁰¹ the Tradition¹⁰² of the Prophet, and statements about the practice of the pious Muslim rulers, and says that the worthiest prince is one "whose heart is the seat of justice."¹⁰³

From ancient Persia he learns the methods of the administration of justice and principle of direct responsibility of the king in matters relating to it. He is so impressed by the Persian standard of justice that he believes that “the Sassanian kings, especially Nushirwan the Just, have surpassed all other monarchs in justice, generosity, and courage.”¹⁰⁴ He says that the Persian kings used to strive so honestly to live up to the principle of impartiality in justice that they could even allow themselves to appear as respondents before the Chief Justice who heard complaints against their royal person.¹⁰⁵ They held it as their personal duty to see that the others also treated the people with the same impartiality and justice, and, in order to hear the complaints personally, they used to hold public audience twice a year, to which everyone was allowed free access, and whoever prevented anyone from going to the king to obtain redress for grievances was sentenced to death.”¹⁰⁶

Besides justice, which is essential for good government, there are some other moral duties, which, as Nizam al-Mulk says a ruler has to perform for the well-being of his subjects. His idea of benevolent despotism involves the notion that a good monarch must rule, not for his own good, but for the good of the whole country. He is responsible for the welfare of his subjects and is personally accountable to God, not only for his own conduct, but also for the conduct of his officials towards the people.¹⁰⁷ It is therefore, an essential part of his duty that he should appoint as government officers only those who are God-fearing, learned, pious, and righteous,¹⁰⁸ and should instruct them to treat the people well,¹⁰⁹ because as justice brings prosperity, oppression leads to the devastation of a country.

This autocratic but benevolent sovereign, depicted for the first time in the writings of Nizam al-Mulk, is a typical Muslim prince who came into existence with the downfall of the Caliphate and continued to live for centuries in the Muslim polity. Equally typical is his vizier, who stands next to him in rank and power in the political hierarch of the kingdom.¹¹⁰ Like the king, he is also of Persian origin; he is, in fact, the Muslim heir of the pre-Islamic Persian grand vizier, called the wazurg-farmdhar, who made his way into the constitutional system of the Caliphate¹¹¹ “when the ‘Abbasids came to copy the administration of Sassanian Empire.”¹¹² This grand vizier was next to the king, and what he was in his relation to the Persian king, the Muslim vizier was to the Caliph.¹¹³

For Nizam al-Mulk, himself a Persian and Grand Vizier, it is quite natural to aspire to model this institution as closely as possible on the traditional line of the Persian vizierate, which had once worked so successfully under the Sassanian rule. But he is not the first writer to speak of this institution, for Mawardi and others had already discussed it in some detail. There is, however, a sharp distinction between the theory, for example, of Mawardi and that of Nizam al-Mulk. What Mawardi speaks of is, in fact, the constitutional position of the vizier in his relation to the caliph, and, therefore, it is what may be called the constitutional theory of vizierate.

With this aspect of the vizierate, Nizam al-Mulk is less concerned, and he seldom refers to it. What really interests him more, or rather exclusively, is

the political and moral aspect of this institution. There is yet another difference: unlike Mawardi, who is primarily concerned with discussing the question what the vizier's functions are in a constitutional set-up, Nizam al-Mulk attempts to show what he ought to be in order to attain perfection in ministerial ethics. He deals with the vizierate on a plane of thought which is nearer to that of the Qabas Nameh of Amir Kaika'us (412/1021 - 475/1082).¹¹⁴ Indeed, his field of study is the art of minister ship, but, compared with Amir Kaiks'us, he treats it on a wider scale and with a touch of personal experience which obviously could not be claimed by the Amir.

To Nizam al-Mulk the vizierate is the most important and the most exalted office, next only to the Sultanate.¹¹⁵ Though this glorification of the ministerial office is not without a tinge of exaggeration, it serves to give an idea of the importance the vizier once had in the Eastern monarchical States, including the Saljuq Empire, in which he played a significant part in politics, and actually shared a good deal of power with the king. In most of the achievements which were attributed to the royal person he had a real hand. Therefore, there is a certain basis of truth in regarding the vizierate as "an institution on which depends the State and the people, the religion and the kingdom."¹¹⁶ This indicates Nizam al-Mulk's belief about the vizierate as an indispensable part in the machinery of a monarchical government. He is also conscious of the historical role it played in bringing so much credit to the kingship in the long course of its career. "All the kings," he says, "who have left their good names on the pages of time, owe it to the felicity of the righteous vizier,"¹¹⁷ and again, "...a good minister brings to the king a good name and leads him to adopt a good conduct. All the princes who had been great, and whose name shall be held in honour until the Day of Judgment, where those who had good ministers."¹¹⁸ Throughout his arguments about the importance of minister ship, he is insistent on the point that the welfare of both the king and the kingdom depends upon the sagacity of the vizier, and that a bad vizier always leads them to destruction.¹¹⁹

What Nizam al-Mulk is attempting here by stressing the importance of the vizierate is not to represent the vizier as a mere intermediary between the king and his subjects, but to show them as the representative of the king and actually responsible to him for the whole administration. That is to say, the vizier, as conceived by him, is in a sense a share in the king's real powers. This was actually the position which Nizam al-Mulk had himself enjoyed in his own life-time as the vizier of the Saljuqs. That in elevating this office to such an exalted position he is mainly encouraged by the Persian tradition, is evident from statement in which he asserts that since the origin of the State up to the days of Yazdigird all administrative affairs had been exclusively in the hands of the viziers. The vizier was the counter-part and deputy of the king.¹²⁰ He is influenced again by the Persian forerunners, the Barmakids, were the first exponents in Islam. To him it seems most desirable that both the kingship and the vizierate should be hereditary, as was the regular practice in ancient Persia from the days of Ardashir, the son of Babekan, to the reign of Yazdigird.¹²¹ He regrets that "when the kingship came to an end in Persia the vizierate also departed from the house of the viziers."¹²²

Nizam al-Mulk presents a picture of the typical minister serving at the Court of an Oriental monarch, when he comes to enumerate the dangers with which this important office was fraught, and the noble qualities which were supposed to be the pre-requisites of the vizierate. He gives a detailed account of them, supported by his personal experiences, or by illustrations taken from contemporary history. It gives an idea of the state of politics and administration in the medieval Orient in which a vizier had to discharge his duties with so many powers to conduct the government, and, at the same time, with so many risks of being suddenly overthrown from office for any mistake.

The dangers in accepting his office, as he enumerates are:

- a) The minister may do injustice to the people as he has to issue numerous orders every day,¹²³
- b) may please one man and displease thousands of others, high and low, rich and poor,¹²⁴
- c) he may displease the princes of the royal household by his acts and may consequently incur the displeasure of the king,¹²⁵
- d) he has to always deal with the nobles and grandees of the empire whose hostility and hate might turn the king against him,¹²⁶ and
- e) there is a large number of officials of high and low ranks upon whom he has to depend in discharging his duties, and their displeasure and conspiracy may undermine his reputation and career.¹²⁷

All this renders the office of the vizier a difficult one, requiring a man of sharp intellect and outstanding abilities. Nizam al-Mulk attempts to lay down at length the essential conditions of this office which were regarded in his days as the qualities of an ideal vizier. The duties of the vizier, he says,¹²⁸ are determined by his four-fold relations: First, he is under the obligation of obedience to God, secondly, he owes allegiance to the royal master, thirdly, he has to care for the favourites of the king, and fourthly, he is concerned with the common people.

One cannot fail to note that his whole discussion of the institution of vizierate, like that of the office of kingship, is pervaded again by a religious and moral outlook, arising out of his sincere regard for religion. In the office of vizierate, as he treats it, diplomacy and morality have been blended together, but emphasis is altogether on its moral ends. To acquire merely worldly pomp and power, he says, should not be the ultimate end of the vizier, what really befits this exalted office is to seek real prestige and a good name in religious and worldly matters.¹²⁹ This can be achieved through upholding the right faith and following the dictates of God faithfully.¹³⁰ It is the duty of the minister that he should strive hard to revive and propagate the faith of Islam and try to attain the excellent moral virtues without which divine favour is impossible. He comes to preach to the vizier a sort of Sufi-like attitude towards political life when he says that he should believe in the divine providence, and should regard his success not as the fruit of his own efforts but as the result of the divine will.¹³¹

Then comes the king who is, according to Nizam al-Mulk, a divinely-appointed authority. He is at pains to make him a point of focus for the loyal sentiments of the whole political society and especially of the official

community among whom the vizier has a greater obligation to pay homage to the king than anyone else.¹³² In order to prove himself a truly obedient servant of his master, he says, the vizier must refrain from seeking any sort of worldly pleasure, because the greatest pleasure for a minister really consists, not in satisfying his own desires, but in pleasing his royal master.¹³³ Therefore, he should direct all his efforts towards reforming the affairs of the kingdom¹³⁴ and increasing the wealth of the State,¹³⁵ which is the only way to please the king.

Finally, he advises the minister to have special regard for the companions, courtiers, and other favourites of the king and the nobles and high officials of the kingdom.¹³⁶ They are always influential figures in a feudal society headed by an absolute monarchy, and have an important role in its politics. As their friendliness has great advantages for the vizier, their antagonism may turn all against him;¹³⁷ therefore, he advises the vizier to be careful in handling them. It is, however, remarkable about Nizam al-Mulk that, in spite of dealing with the problems of an office of a diplomatic nature within the framework of feudalism, which is always tainted with conspiracies, he does not induce the vizier to follow cunning methods. Instead, he believes in the moral standards of political conduct and insists that the vizier “should steadily follow the path of truth and righteousness in State affairs,” and this would serve to protect him from the enmity of his foes and would ultimately convince them of his integrity.¹³⁸

Nizam al-Mulk’s importance as a political thinker must rest, not on the practical suggestions he offered to improve the conditions of a particular State, but on his theories of monarchy and minister ship. He was the first to discover the moral and political principles of kingship and vizierate and wherever the two institutions came into existence in the Muslim world, his ideas served as their theoretical foundations. It is evident from the references to his works in the writings of the succeeding generations, that he was generally studied. Even the contents of *Wasaya* ‘were known far and wide,’¹³⁹ long before they came to be compiled in the form of a treatise in the ninth/15th century. The vast literature on political ethics produced in later days, especially the treatises written for the guidance of Muslim princes, contain a good deal of the political principles which are enunciated for the first time by Nizam al-Mulk. This may be considered to be his direct influence on the later development of Muslim political thought.

Chapter 39: Al-Ghazali

The structures of political authority in Islam are by no means as simple as it seems at first glance. In the legalistic theory of the caliphate expounded by the Sunni jurists the Shari'ah is quite obviously the source of all authority, including political authority as well. As a body of more or less concrete law, the Shari'ah itself must be authorized from some source, which is presumably qualified to judge right from wrong.

Theoretically, the Shari'ah is changeable from time to time, i.e. from prophet to prophet, but the Shari'ah of a prophet is the best law for the time for which it is laid down. It is claimed that the Islamic law is laid down for all times to come. It is elastic only in the sense that some parts of one of its sources (the Qur'an) are given in such general terms as are capable of different interpretations at different times, and the validity of some parts of another source (Hadith) depends upon historical authenticity. Human beings may not change the laws laid down by the Shari'ah but they may know them or not know them, interpret them or not interpret them, obey them or disobey them. The pre-requisite for the knowledge of the Shari'ah is acknowledgement of the established sources of the Shari'ah, i.e. usul al-din. The pre-requisite for obedience is belief.

The ultimate source of authority is God. It is only the good that God commands and only the evil that He forbids. The principal difference between the Sunni and later Shi'ite persuasions is the Sunni doctrine that the last and definitive revelation is the Qur'an, and Mohammad is the last human being to be endorsed with revealed knowledge of right and wrong. The successors of Mohammad may only know the Shari'ah by reference to the Qur'an, to the behaviour of Mohammad, and, wherever these sources are not explicit, to the consensus of Muslims - or indeed by reference to analogical judgment. Thus, the proximate sources of authority are the Qur'an, the Sunnah, Ijma' and qiyas.

The immediate source of authority is somewhat more difficult to ascertain. Learning, or 'ilm, is necessary for the discovery of what the Shari'ah is, and this qualification is the source of the title 'ulama'. The Sunni 'ulama' are distinguished from others by their acknowledgement of the "canonical" sources of the Shari'ah. However, since there is no priesthood in Islam, the 'ulama' form an undefined and unwieldy body. The business of discovering the law is at times very much like legislation, but the non-officialised body of the 'ulama' tend to convert their function to that of a huge, unwieldy board of judicial review.

Obviously such action as might be undertaken by such a group must come after the political fact, and because of the nature of the institution the time-lapse between deed and decision might be generations. It would be wrong to deny the 'ulama' any authority at all, for the 'Abbasid dynasty went to great lengths to secure the support of the 'ulama' and to display respect for their judgments. The pattern of political behaviour thus was carried on by subsequent Islamic rulers. Nevertheless, it was characteristic of the Caliphs to claim the more remote authority for their government.

In a sense the Muslim community, because of its intimate connection with the principle of ijma', may be reckoned a source of authority.

However, since ijma' is a source of the Shari'ah, and since it is a process rather than an institution, it cannot satisfy the requirement of an immediate source of authority. As a source of the Shari'ah it is theoretically anterior to it, and, thus, a more remote source of authority. In any case, it is still subject to "discovery" and interpretation by the 'ulama'. As a process, its legislative efficacy is similar to that of custom in Roman and Canon Law, so the time-lapse is necessarily great.

The Muslim community is not only the Islamic Church, but it is also the personal sphere of validity of Islamic government. Membership in the community is the result of belief, and belief is the basis of obedience to the Shari'ah. The purpose of Islamic government is to see to it that the Shari'ah is obeyed. In other words, the part the community plays in political affairs is primarily passive, although Islamic government is clearly established for the benefit of the Muslims.

Regardless of the degree and kind of authority attributed to the 'ulama' and the community, neither group ever wielded real political power to transform their political function to that of an institution authorizing the day-to-day acts of government. Theoretically, the Muslim system all but disregards the question of power, practically, it is another question. Ibn Khaldun is the most outstanding Islamic theorist of those few who dealt with the problem of power. He asserts that power and authority were joined in the Orthodox Caliphate.¹ Ideally, of course, power should reside with the immediate source of authority in the community.

The relation of the caliphate to the Shari'ah is more difficult to define than that of the 'ulama' or the community. During the whole of the Umayyad and the early part of the 'Abbasid Caliphate, the Caliph is much more the exponent of power than of authority. In the last centuries of the 'Abbasid Caliphate the Caliph could hardly be considered the exponent of power either. Was he then the most immediate representative of authority?

With the exception of the Qur'anic Law, the caliphate and the Shari'ah developed pari passu. The Sunnah of the Prophet did not become constitutive until treated as such by the successors of the Prophet. Ijma' and qiyas are certainly later accretions. This historical fact has tended to complicate the relationship of the Caliph and the Shari'ah. In the main, the Caliph is the executive of the Shari'ah, the commander-in-chief of the Muslim army, and the leader in formal religious observances prescribed by the Shari'ah.

Above all, the Caliph is the head of the religious institution in Islam, only of the formalized part of it. Since religion was an all-inclusive concept, he was also the political institution. The sub-ordination of the Caliph to the Shari'ah was most clearly expressed as a by-product of early political controversy in the attacks on the piety and personal behaviour of the Umayyad Caliphs.² That the political behaviour of the caliph must be in accordance with the Shari'ah, was implicit in 'Abbasid religious policy. The theoretical implications of this policy were limited only to the function of the Caliph once appointed and as a consequence fail to define the authority for the appointment of a particular Caliph, or the authority for the institution itself.

The circumstantial authority arising out of the contention that the Caliphs were properly executing the function of the Caliphate did not exhaust the 'Abbasid theory. Their personal claim to the office itself was based both on agnate descent from the Prophet and the action of divine Providence. This theory of constitutive authority was never denied by Sunni theorists, but it was certainly omitted in the heavy casuistical overlay which attempted to camouflage the fact of dynastic succession.

In time the Sunni theory of the constitutional process came to be a composite of the actual circumstances of the historical appointment of various Caliphs. These various circumstances were codified in detail, and with some juridical expansion by al-Mawardi,³ but the Shari'ah nature of the constitutional process had already been established.

Thus, the Shari'ah was recognized as authority for the acts of the caliph and for the manner of appointment of a particular Caliph, but there remains the problem of the authority for the institution itself. Al-Baghdadi's answer that the Caliphate is required because there are certain explicit Shar'i duties incumbent upon the Caliph merely begs the question.⁴ We must be satisfied then with the conclusion that the authority of the Caliph is primarily circumstantial, i.e. he has authority for what he does rather than for what he is.

What the Caliph is depends rather upon historical events, and this is not surprising since the institution developed along with the Shari'ah. History has a legislative character in Sunni Islam, and the Caliphate is the prime example of the legislative efficacy of history. On the other hand, the effect of historical legislation is primarily retrospective. As a result, we are told what the Caliph was and what he should not be. Clearly, Sunni theories of the Caliphate are not slavish descriptions of the obtaining conditions, but in so far as they deviate from the merely descriptive, they also concentrate on the function rather than the institution of the Caliphate.

So long as sufficient measure of power was attached to the Caliphate, this question did not agitate Muslim theorists. We might say the institution of the Caliphate was almost taken for granted. However, when the Caliphs lost control of affairs, circumstantial authority had no longer applied to the Caliphate. Al-Mawardi was very much aware of this problem, but his treatment of it was entirely inadequate. He insists on the legitimacy of the Caliph who is constrained by one of his military sides, even though he expressly states that the "obligatory" character of the Caliphate is derived from the Caliph's duties as executor of the Shari'ah.⁵ Nevertheless, al-Mawardi has not necessarily contradicted himself - he has simply failed to state explicitly the source of Caliphal authority.

It was this omission which permitted theorists of the post-'Abbasid period to apply the criteria of circumstantial authority to the actual but "unconstitutional" holders of power. The inevitable corollary was the establishment of power as the constitutive authority of the Caliph. Regarding the theory of al-Mawardi, our inference is that he considered the constrained Caliph legitimate because of the validity of the constitutional process by which he was appointed. The resulting situation is pure anomaly, the authority of the Caliph is his "constitutionality," while the authority of

his constrainer is circumstantial (derived from his ruling in accordance with the Shari‘ah), and the sum total is legitimate government.

Al-Ghazālī’s attempt to solve this problem is much more serious than that of the preceding theorists. In many important respects his theory departs from the well-established pattern of Sunni theory. On the other hand, these divergences are carefully couched in terms calculated to maintain the essentials of traditional Sunni theory. While remembering that the classification of authority as functional, constitutional, and institutional is only an analytical construction, which finds no place in Islamic theory, we may find his classification helpful in analyzing al-Ghazālī’s theory.⁶

In referring to Islamic government al-Ghazālī uses the same term as his predecessors. However, it is almost immediately clear that he has something else in mind, and not the traditional Caliphate of even al-Mawardi. He follows the prejudice in favour of a one-man government, but his implication is clearly that of a multi-lateral rather a unitary government. Most important of all is his association of the Caliph with the Sultan. We shall return to this problem, but it is necessary to realize that he assumes the co-operation of the Caliph and the actual holder of power in his discussion of the obligatory character of the Caliphate.

In keeping with the then traditional treatment of the question of the obligatory character of the Caliphate, al-Ghazālī first directs his argument against those who deny the Caliphate, and then against those who deny its obligations altogether.⁷ The first argument is a positive one, and concerns the institutional authority for the Caliphate. The second is a negative argument, and sheds light on the nature of the Caliphate and the duties attached thereto. After dealing with these two arguments we shall discuss his treatment of the constitutive process with special reference to the qualifications of the Caliph and the constituent power.

The Mu‘tazilah asserted that the obligatory character of the Caliphate was based on “reason” and not upon the Shari‘ah. The Sunni jurists insisted upon the Shari‘ah as the basis of the Caliphate. Al-Ghazālī follows the accepted Sunni line, but he develops his argument in a more logical fashion, adding new elements. First, he states that the Caliphate does indeed have utility, but he traces the proof of the Shar‘i obligation of appointing an Imam first to ijma‘ and, second and more importantly, to the deduced will of the Prophet. He contends that the will of the Prophet was the source of the consensus of the community. His argument is that the prophet’s purpose was the formal establishment of the religion of Islam. To secure this end both life and livelihood must be protected. The appointment of an imam is, therefore, obligatory. He also indicates that only through the performance of formal religious observances may the bliss of the hereafter be achieved.

We have found the usual Sunni insistence upon the Shar‘i character of the Caliphate inadequate for the definition of the institutional authority of that office. In supporting this view, the Sunni theorists point to no specific provisions of the Shari‘ah. Instead, they reason from the prescribed duties, deducing the executive institution.⁸ The weakness of their argument is manifest, for as we have seen, the Caliphate existed in fact before any of its duties were defined. By the addition of new elements to this argument, al-

Ghazālī goes much further towards a definition of the institutional authority of the Caliphate. The most important innovation is his reference to the consensus of the community, which is no less than the historical practice of the community. Evidently, this is historically legislation.

Technically, the consensus by which the community has authorized the institution of the Caliphate has reference to the consent of the Companions of the Prophet to the establishment of the Orthodox Caliphate. The phrase “consensus of the community” is sufficiently vague to include the consensus of other generations as well. However, the consensus of the community is not actually a legislative process, but merely evidence of the fact that what has been approved by the community is actually provided for in the Shari‘ah. Despite this legal detail, we must conclude that the authority for the institution of the Caliphate is derived from the community of the Muslims.

By the time al-Ghazālī wrote, the consensus of the community had become a source of the Shari‘ah in its own right. The community at large has been endowed by the grace of God with a special character, summed up in the words of the Prophet, “My community will never agree in error.” The important thing to note is the consensus implies unanimity, or very nearly that. The community as a source of authority is then considered collectively. Ijma‘ is, as has been said, primarily a conservative principle, tending to approve and perpetuate existing phenomena. But it is correlatively a dynamic principle, expressing in a way the historical continuity of the Islamic community. The institution of the Caliphate is intimately bound up with the collective unity of the community, as well as with its historical continuity.

Al-Ghazālī’s logical bent of mind will not allow to be satisfied with the mere evidential fact of ijma‘. Clearly, ijma‘ itself contains no logic, while al-Ghazālī’s intention is to frame the requirements of the Shari‘ah in a manner best calculated to convince the protagonists of reason. Therefore, he goes back to the source of the ijma‘ which is, he says, the intention of the Prophet to organize the establishment of Islam.⁹ Primarily, he is referring to the establishment of external observances of the religion such as prayer, fasting, and pilgrimage, the execution of the hudud punishments for such transgressions as drinking and adultery, the maintenance of the Shari‘ah Law in such matters as marriage and inheritance, and the administration of Islamic justice by means of the Qadis.

Under these headings come the collection of taxes and the government administration, for these are included either directly or indirectly in the Shar‘i requirements concerning them. The Prophet may have desired to accomplish other, less concrete things as well, but here the main point is his purpose of organizing the administration of the (Sunni) religion. Although it is here presented in slightly different terms, this is the same old argument leading to the functional or circumstantial authority of the Caliphate. Al-Ghazālī’s argument goes on to show that the requirements of the Shari‘ah imply the requirement of an institution of some sort to execute them. That institution, the form of which has been authorized by the consensus of the community, is the Caliphate.

Though al-Ghazālī rejected the argument of the Mu‘tazilah that the obligatory character of the Caliphate is based upon reason, he agrees with them that it does have utility. Utility is a concept with a minimum of religious connotation. We have seen that the Shari‘ah contains very many material provisions, but none of these could be classified by a Muslim as merely utilitarian. Obviously, al-Ghazālī is referring to governmental functions common to all centralized coercive orders, such as the maintenance of order and the security of life and property. This utility can only exist where power is present.

The subject of utilitarian power comes into al-Ghazālī’s argument again when he attempts to prove that the Imamate is necessary for the realization of the Prophet’s goal. It enters when he says that material security is a prerequisite for the carrying out of the Shari‘ah.¹⁰ The concrete character of so many of the Shari‘ah provisions necessitates, in the establishment of the Shari‘ah in the setting of a civic religious institution.

Obviously, this implies the existence of a favourable disposed political power. This is provided by the Sultanate. His conclusion is that the Caliphate (execution of the Shari‘ah because of its relationship with the Sultanate (coercive power) is required as a result of the objective of the Prophet (the establishment and institutionalization of the Shari‘ah). In the progress of this argument the Sultanate is brought in without any explanation of the relationship of the bearer of power to the Caliph; we only know that the function of the Sultanate is an essential element of the authorized Caliphate.

In a later argument al-Ghazālī opposes those who deny the obligatory character of the Caliphate altogether. Here we get into some confusion of terms. The contention of al-Ghazālī’s opponents is that the Caliphate has lapsed because there is no qualified person to serve in that capacity.¹¹ The implication of their statement is that the Caliphate is not, therefore, a rigid requirement of the Shari‘ah. At least this is in some measure the way in which al-Ghazālī chooses to understand their argument. In his own approach al-Ghazālī definitely confuses the terms obligatory (moral) and necessary (natural).

The argument is simple: there ought to be a Caliph, therefore, there must be a Caliph, therefore, there is a Caliph. From this we are probably justified in deducing that the opposing argument runs, there is no Caliph, therefore, there need not be a Caliph, and therefore there is no obligation to appoint a Caliph.

Al-Ghazālī’s final argument on this question is his asking what would become of all those religious, social, economic, and political phenomena which are regulated by the Shari‘ah if there were no Caliph.¹² He contends that without the existence of the Caliphate no judgment of a Qadi, no contract, no testament would be valid. In other words, the power of all Qadis and government officials is derived from the Caliph. In theory, Islamic government is perfectly centralized. The authority which any individual Qadi has is completely derived from the Caliph, and not from the task he performs, as is the case of the Caliph’s own authority. It is inconsistent, but there is no circumstantial authority for sub-ordinate

officials, their authority is only constitutive (derived from the manner in which they were appointed). Thus, the absence of the Caliphate would turn every normal human relationship into sin, and lead to disorder and strife. He does not say what effect such social disintegration might have on the chances of the individual Muslim for salvation, but from other indications we may conclude that they would be considerably reduced.

We are not much clearer on the nature of the Caliphate in al-Ghazālī's theory: (a) The Caliphate comprehends the necessary power to accomplish the maintenance of order. (b) It represents or symbolizes the collective unity of the Muslim community and its historical continuity. (c) Deriving its functional and institutional authority from the Shari'ah in the community as well as the symbol of the divine guidance of the Sunni community by virtue of its obedience to the Shari'ah. It is not coincidental that these three aspects of the Caliphate correspond to al-Ghazālī's three sources for the obligatory character of the Caliphate: (a) utility, (b) ijma', and (c) the objective of the Prophet.

So much for the Caliphate, what about the Caliph himself? Al-Ghazālī joins the earlier theorists in giving a long list of qualifications required of for the office. Ideally, al-Ghazālī's qualifications are the same as those of al-Mawardi's. The Caliph must be without physical as well as mental defects. He must be honourable, courageous, wise, and so on. It must not be thought that these qualifications are mere words. They do not represent abstract qualities, but rather their concrete equivalents. Thus, he must be able to defend the Muslims against their enemies and maintain internal order. He must be able to make judgments in accordance with the Shari'ah. He must be able to administer the affairs of the State. Finally, he must be of Quraishite descent. Al-Ghazālī adds that he must be an 'Abbasid.¹³

These requirements are very great, and it is not surprising that they were, in reality, never completely fulfilled. The only stipulation which had been fulfilled was that the Quraishite lineage, and for 300 and more years before al-Ghazālī, the Quraishite Caliph, had been an 'Abbasid. This fact, more than anything else, represented the unity and historical continuity of the Sunni community.

The inconsistency in al-Mawardi's theory stems from the fact that he insisted upon these qualifications in the Caliph, while permitting the Caliph to be inactive. On the Caliph's inactivity he clearly contradicts his own words. At one point, al-Mawardi insists on the personal activity of the Caliph, while at another he validates his being constrained by one of his military sides. The reasons which might have justified al-Mawardi's equivocation were no longer effective in al-Ghazālī's time. We find al-Ghazālī facing the problem of the inactivity of the Caliph, and the related problem of his qualifications.¹⁴

To understand al-Ghazālī's treatment of this problem we must bear in mind his insistence upon the obligatory, even necessary, character of the Imamate. We are not concerned with "an irresistible force" and an "immovable object." Al-Ghazālī tells us frankly that the necessity of having an Imam is so great that it compels the alteration of the qualifications when there is no other way out.¹⁵ The licence of duress had, indeed, been applied

previously by al-Mawardi to validate the rule of “Amirs by Conquest,”¹⁶ but he does not seem to have been able to bring himself to do the same for the constrainer of the Caliph.

At any rate, al-Mawardi did not permit, even in a case of duress, the lowering of the qualifications of the Imamate. Perhaps al-Mustazhir was obviously unqualified, or it might be that al-Ghazālī was more honest than al-Mawardi; anyway al-Ghazālī is willing to concede many of the qualifications in order to maintain the Caliphate. About the only concrete thing that he insists upon is that the Caliph be of Quraishite lineage. As a result, the personal qualifications of the Caliph are hardly applicable to the nature of the Caliphate. On the other hand, the symbolic character of the Caliph could not be more sharply drawn. In other words, the Caliph himself represents only one of the three major aspects of the Caliphate.

The qualifications of the Caliph are probably the well-developed part of the constitutive process in the hands of Islamic theorists. But they are very vague in their description of the constituent power. Al-Ghazālī says there are three ways in which one of those who is qualified for the Caliphate may be chosen: by designation of the Prophet, by designation of the ruling Caliph or by designation of the holder of actual power. Al-Ghazālī tells us that only the last alternative applies to his time.¹⁷ Designation alone is not sufficient for appointment, for there must be the bai‘ah as well. The bai‘ah must be performed by the great man and the people of “loosening and binding” (ahl al-hall w-al-‘aqd).¹⁸

It is not easy to ascertain who these people are, but we take the great men to be those with some measure of power; and the people of loosening and binding to be the ‘ulama’; in concrete terms, this means that the most powerful Saljuq leader appoints the Caliph, then the appointee is recognized by the less Saljuqs, local princes, and the chiefs of the bureaucracy, and finally the appointment receives the consent of the ‘ulama’. There is probably a fourth stage in which the appointment is announced in the mosques, and the people accept the decision handed down from above. In view of al-Ghazālī’s statement to the effect we must look upon the holder of power, or the Sultan, as the constituent power. The whole of the constitutive process beyond the bare fact of appointment by the Sultan is a formality.

Al-Ghazālī’s treatment of the constitutive process by no means contravenes the accepted requirements of the Shari‘ah in this matter. It is true that al-Mawardi sets up special qualifications for those who choose the Caliph, as Mawardi sets up special qualifications for those who choose the Caliph, as well as for the Caliph himself. But, generally speaking, the Sunni theorists are sufficiently vague about the question of selectors to allow al-Ghazālī’s theory to meet their standards, particularly since some of them at least insist that their need not be more than one selector.

On the other hand, it is quite possible that he belittles the importance of the bai‘ah of the ‘ulama’ too much. His reason for this is probably that the important question for him was whether or not the Sultan would choose anyone at all. But, of course, the Sultan’s primary concern was that his choice should be acceptable to the ‘ulama’ and the people. Were he not concerned with the attitude of these groups, and perhaps his own salvation,

the Sultan might dispense with choosing a Caliph altogether. Having chosen a Caliph, he has gone so far towards preserving law and order and the “establishment of Islam” that al-Ghazālī cannot conceive the repudiation of his choice by the ‘uluma’ or the people.

The constitutive process is, then, loosely speaking, a Shar‘i process, but the constituent power is the Sultan. The limitations upon the Sultan’s choice are real, as is the importance of the general bai‘ih , but since these have much greater reference to the functional and institutional authority of the Caliphate, we shall do no more than make a mental note of them here. Our conclusion is that the constituent authority for the appointment of the Caliph is the Sultan.

There is no contradiction between this conclusion and our previous statement that the source of all authority in Islam is the Shari‘ah, for the Shari‘ah has a tendency to recognize existing power in the constitutive process. Besides, as long as the Caliph had no power to do anything, the most important aspect of Shari‘ah authority, i.e., functional authority, does not become operative. As a result, the constituent authority of the Sultan is the critical political factor. One might argue that the Sultan derives this authority from the Shari‘ah, but that would not be what al-Ghazālī himself has argued.

From the foregoing, we can see that the Caliph is different from the Caliphate, and that the authority for one differs from the authority for the other. We must now examine the relationship of the Caliph to the Caliphate, and of the Sultan to them both.

If the Caliph does not satisfy all the requirements of the Caliphate in him, it is at least clear that he is its principal personal representative. We have already established that the Caliph has a special connection with the authoritative source of ijma‘. On the other hand, we know that he cannot possibly be the personal subject of functional authority, since he has no power. Contrarily, no governmental act, unless performed directly or indirectly by the Caliph, has any validity.

We have already seen the Sultan is, in some measure, the authority for the Caliphate. However, the actual government in the world of Islam is carried out by the Sultan. Circumstantial authority is not considered sufficient to legitimize the government of the Sultan even if it is not a conformity with the Shari‘ah.¹⁹ The only way in which the government of the Sultan is valid and authorized is through its recognition of the Caliph. As we have already stated, no government, other than that of the Caliph, is valid under the Shari‘ah, and sub-ordinate officials have only delegated authority, not functional. Thus, the validity of the government of the Sultan is established only upon the Sultan’s oath of allegiance to the Caliph, and the Caliph’s appointment of the Sultan. By his exercise of the constitutive authority, the Sultan recognizes the Islamic Sunni community, and in theory, the functional authority which rests with the Shari‘ah proper.

The fact that al-Ghazālī accepts this compromise sheds some light on the political objectives of Sunni theorists. The total achievement of this arrangement is the recognition by the holder of power that the Shari‘ah is the organizing principle of the Sunni community, and, in more concrete

fashion, the establishment of Sunni Islam. The element of compromise enters when al-Ghazālī argues for the legitimacy of this arrangement, even though the Sultan actually ignores many provisions of the Shari‘ah. Recognition of the Shari‘ah by the Sultan with obedience to its provisions is form without content. This leads us to the second objective of the Sunni theorists, that is, the establishment of order and maintenance of discipline.

The governmental scope of the Sultanate included very few of the interests which concern modern governments. By the establishment of order and the maintenance of discipline the Sultanate merely provided a favourable field for the activity of the established Islamic institution. Al-Ghazālī, therefore, felt justified in validating the government of such a Sultan. He was willing to make concessions regarding a limited number of Shari‘ah regulations in order to preserve the religious life of the community.

Just as the Caliphate comprehends the function of the Sultan, so does it also comprehend the religious and legal duties imposed by the Shari‘ah. As we have said, the Caliphate is a religious as well as a political institution of Islam. We have also seen that al-Ghazālī does not insist upon the qualifications which the Caliph must have in order to carry out his religious duties. If necessary, the Caliph may enlist the aid of the most outstanding learned people of the day.²⁰ The principal political function of the ‘ulama’ is the interpretation of the Shari‘ah in terms of the problems facing the community. In short, by their approval of the Sultan’s choices of the Caliph (bai‘ah) and by their fatwas, the ‘ulama’ express the functional authority of the Shari‘ah.

The term caliphate stands for the whole of Islamic government. Although al-Ghazālī seems to follow the traditional prejudices in favour of autocracy, it is obvious that his is a multi-lateral conception of the caliphate. In it there are three main elements: the Caliph, the Sultan and the ‘ulama’, each corresponding in some aspect of the authority behind Islamic government and each performing a function required by the authority. The greatest virtue of al-Ghazālī’s theory is its political realism, and yet he has maintained the essentials of the traditional theory. Each of the parts of the Caliphate represents not only an aspect of authority and a function of Islamic government, but also one of the major elements of political power in the Sunni community.

Was al-Ghazālī’s theory an accurate description of the government of his time? Such a development of the caliphate was the result of many diverse and fortuitous events. Nevertheless, the roots of this development may be traced back to the calculated policy of the early ‘Abbasids. The early ‘Abbasids based their government upon the power of troops imported from Khurasan, and not upon local Iraqi levies. They asserted their own legitimacy upon the circumstantial fact, that they were ruling in accordance with the Shari‘ah. They went out of their way to honour the ‘ulama’ and give them a place at Court.

Ultimately, the success of the system depended upon the maintenance of delicate balance of power, and upon the continued co-operation of those forces. The fact of the matter was that when the relative power of each element of the government changed it was not supported by the others. Al-

Ghazālī argued for the independence of the 'ulama' and he urged them to resist the blandishments of the Sultan. When the Sultan was powerful he interfered with the succession to the Caliphate in a manner calculated to lower the influence and prestige of that office. When the Sultan grew somewhat weaker, the Caliph was eager to exercise local power himself. Al-Ghazālī's theory notwithstanding, the existence of the Caliph alongside the Caliphate was an ever-present temptation to re-establish the old order.

The multi-lateral conception of the Caliphate was not opposed to al-Mawardi's ideal construction. Al-Ghazālī did not reject the traditional Sunni theory. In fact, al-Ghazālī sought only to explain the political conditions of his own time in terms acceptable to traditional Sunni thought. If he ground any axe at all, it was for the Sunni 'ulama', who were certainly a most conservative body. Nevertheless, once the Caliphate could be resolved into its component parts, it became possible for the rest of the parts to hobble along without the Caliph himself. In this sense al-Ghazālī paved the way for the post-'Abbasid development of the Sunni political theory.

The original inspiration for al-Ghazālī's theory of the Caliphate seems to have come from his interest in Hellenistic thought. We find an interesting statement of the same principle in no less an exponent of the opposing "philosopher-king" theory than Nasir al-Din al-Tusi. Al-Tusi says that the second possible variation of the supreme government of the Virtuous City arises when all the qualities required of a philosopher-king do not exist in one man, but are produced in several men collectively.²¹

More significant than the parallel passage in Akhlaq-i Nasiri is the reflection of al-Ghazālī's theory in the writings of ibn Taimiyyah. If anything, ibn Taimiyyah was more enamoured of the past than al-Mawardi, but by the time he wrote the 'Abbasid Caliphate was no more. Ibn Taimiyyah argued that legitimate Islamic government in his days was composed of the Amirs and the 'ulama' acting in co-operation with one another. Ibn Taimiyyah's principle of "co-operation" leads him to repeat al-Ghazālī's theory of divided authority in accordance with the qualifications of various persons in opposition to the theory which accorded complete authority to the ruling war-lord.²²

The origin and development of this principle present many difficulties, but Laoust tells that ibn Taimiyyah was influenced rather by the Arab Neo-Platonists, such as the Ikhwan al-Safa, than by al-Ghazālī.²³ It is unlikely that the idea itself originated with al-Ghazālī who was himself deeply influenced in his youth by the Hellenistic movement in Islam. Nevertheless, his application of it to the Sunni caliphate was certainly an innovation, and all the more noteworthy for its reappearance two centuries later in the works of ibn Taimiyyah. It need hardly be added that the 'ulama' did in fact assume a special position of political authority as well as a part of the "original" Caliphal functions in the ottoman State, and to a lesser extent, perhaps, in the Mughul Empire in India.

Notes

1. Ibn Khaldun, Muqaddimah, Beirut, 1900, pp. 2-3ff.
2. Goldziher has set forth the arguments of the early political factions in Volume 2 of his Mohammedanische Studien.
3. Al-Mawardi, al-Ahkam al-Sultaniyyah, Cairo, 1909, Chapter 1.
4. 'Abd al-Qahir ibn Tahir al-Baghdadi, Usul al-Din, Istanbul, 1928, p. 272.
5. Al-Mawardi, op. cit., p. 16
6. Functional authority is that which authorizes each separate act of the Caliph, without regard to the manner of his appointment. Institutional authority is that which provides that there shall be such an institution as the Caliphate. Logically, institutional authority must precede functional authority, though the office and its duties are conceptually joined. Constitutional authority provides for the manner in which a Caliph should be appointed. It will usually be found that the question of legitimacy in Islamic political theory relates to the constitutive process, while functional lapses are regarded as disqualifying and not illegitimizing.

16. Al-Mawardi, op. cit., Chapter 3, pp. 27 - 28.
17. Ihya', loc.cit.
18. Iqtisad, p. 107. The bai'ah is important, even essential, but not constitutive. Thus, according to al-Ghazālī, it a qualified Qurayshite is an actual holder of power, he may be appointed himself as Imam. (This denied by al-Baqillani, al-Tamhid, p.180, and so may not be taken as a generally accepted Sunni theory). Nevertheless, the bai''h remains necessary, having only a declarative effect.

A History of Muslim Philosophy

A Compendium of articles on the History of Muslim Philosophy. In this book: Pre-Islamic Philosophical Thought

Publisher(s): Pakistan Philosophical Congress

Miscellaneous information:

With short accounts of other Disciplines and the Modern Renaissance in the Muslim Lands Edited and Introduced by M. M. SHARIF Director of the Institute of Islamic Culture, Lahore Pakistan. Published by Pakistan Philosophical Congress <http://www.muslimphilosophy.com/hmp/index.html>

The Setting of Volumes and Books with the Name of Writers of each Chapters and ... is as following:

Volume 1

Book One Pre-Islamic Philosophical thought

Part 1

Chapter 1: Pre-Islamic Indian Thought, by: C. A. Qadir

Chapter 2: Pre-Islamic Chinese Thought, by: Howard F. Didsbury

Chapter 3: Pre-Islamic Iranian Thought, by: Alessandro Bausani

Chapter 4: Greek Thought by M. M. Sharif

Chapter 5: Alexandrio-Syriac Thought by C. A. Qadir

Part 2

Chapter 6: Pre-Islamic Arabian Thought by: Shaikh Inayatullah

Book Two Advent of Islam

Fundamental Teachings of the Qur'an

Chapter 7: Philosophical Teachings of the Qur'an by M. M. Sharif

Chapter 8: Ethical Teachings of the Qur'an by B. A. Dar

Chapter 9: Economic and Political Teachings of the Qur'an by Abul Ala Maudoodi

Book Three

Early Centuries (From the First/Seventh Century to the fall of Baghdad)

Part 1: Theologico-Philosophical Movements

Chapter 10: Mu'tazilism by Mir Valiuddin

Chapter 11: Ash'arism by M. Abdul Hye

Chapter 12: Tahawism by A. K. M. Ayyub Ali

Chapter 13: Maturdism by A. K. M. Ayyub Ali

Chapter 14: Zahirism by Omar A. Farrukh

Chapter 15: Ikhawan al-Safa by Omar A. Farrukh

Part 2: The Sufis

Chapter 16: Early Sufis: Doctrine by M. Hamiduddin

Chapter 17: Early Sufis: (Continued):

Sufis before Hallaj by B. A. Dar

Al-Hallaj by Louis Massignon

Chapter 18: 'Abd al-Qadir Jilani and Shihab al-Din Suhrawardi by B. A.

Dar

Chapter 19: Shihab al-Din Suhrawardi al-Maqtul by Seyyed Hossein Nasr

Chapter 20: Ibn 'Arabi by A. E. Affifi

Part 3: The "Philosophers"

Chapter 21: Al-Kindi by Ahmed Fouad El-Ehwany

Chapter 22: Muhammad ibn Zakariya al-Razi by Abdurrahman Badawi

Chapter 23: Al-Farabi by Ibrahim Madkour
Chapter 24: Miskawaih by Abdurrahman Badawi
Chapter 25: Ibn Sina by Fazulr Rahman
Chapter 26: Ibn Bajjah by Muhammad Saghir Hasan al-Ma'sumi
Chapter 27: Ibn Tufail by Bakhtyar Husain Siddiqi
Chapter 28: Ibn Rushd by Ahmed Fouad El-Ehwany
Chapter 29: Nasir al-Din Tusi by Bakhtyar Husain Siddiqi
Part 4: The Middle-Roaders
Chapter 30: Al-Ghazali: Metaphysics by: M. Saeed Sheikh
Chapter 31: Al-Ghazali: (continued
Mysticism by: M. Saeed Sheikh
Ethics by Abdul Khaliq
Influence by: M. Saeed Sheikh
Chapter 32: Fakhr al-Din Razi by Seyyed Hossein Nasr
Part 5: Political thinkers
Chapter 33: Political Thought in Early Islam by Abul Ala Maudoodi
Chapter 34: Abu Hanifah and Abu Yusuf by Abul Ala Maudoodi
Chapter 35: Al-Farabi by Muhammad Saghir Hasan al-Ma'sumi
Chapter 36: Al-Mawardi by Muhammad Qamaruddin Khan
Chapter 37: Political Theory of the Shi'ties by Syed Abid Ali Abid
Chapter 38: Nizam al-Mulk Tusi by M. Rukunuddin Hassan
Chapter 39: Al-Ghazali by Leonard binder

Volume 2

Book Four

LATER CENTURIES (From the Fall of Baghdad[656/1258] TO 1111/1700)

Part 1: The FALL OF BAGHDAD

Chapter 40: Fall of the 'Abbasid Caliphate by Abdul Shakoor Ahsan

Part 2: ThEOLOGICO-PHILOSOPHICAL THOUGHT

Chapter 41: Ibn Taimiyah by Serajul Haque

Part 3: The SUFIS

Chapter 42: Jalal al-Din Rumi by Khalifah Abdul Hakim

Chapter 43: Mahmud Shabistari, al-Jili and Jami by B. A. Dar

Chapter 44: Shaikh Ahmad Sirhindi by Muhammad Farman

Part 4: The "PHILOSOPHERS"

Chapter 45: Jalal al-Din Dawwani by Bakhtyar Husain Siddiqi

Chapter 46: Ibn Khaldun by Muhsin Mahdi

Part 5: The MIDDLE-ROADERS

Chapter 47: The School of Ispahan by Seyyed Hossein Nasr

Chapter 48: Sadr al-Din Shirazi (Mulla Sadra) by Seyyed Hossein Nasr

Part 6: POLITICAL THOUGHT

Chapter 49: Ibn Khaldun by Muhsin Mahdi

Book Five

OTHER DISCIPLINES (Covering both the Early and the Later Centuries)

Part 1: LANGUAGE AND LITERATURE

Chapter 50: Arabic Literature: Poetic and Prose Forms by S. M. Yusuf

Chapter 51: Arabic Literature: Grammar and Lexicography by S. M. Yusuf

Chapter 52: Arabic Literature: Theories of Literary Criticism by M. Khalaf-allah

Chapter 53: Persian Literature by Sa'id Naficy

Chapter 54: Turkish literature by Meedut Mansuroglu

Part 2: FINE ARTS

Chapter 55: Architecture:

The First Three Centuries of Muslim Architecture by K. A. C. Creswell

Muslim Architecture in Later Centuries by S. Sibte Hasan and M. Abdullah Chaghatai

Chapter 56: Painting by M. Ajmal

Chapter 57: Music by H. G. Farmer

Chapter 58: Music (Continued) by H. G. Farmer

Chapter 59: Minor Arts by Syed Abid Ali Abid

Part 3: SOCIAL STUDIES

Chapter 60: Historiography by I. H. Qureshi

Chapter 61: Jurisprudence by M. Hamidullah

Part 4: THE SCIENCES:

Chapter 62: Geography by Nafis Ahmad

Chapter 63: Mathematics and Astronomy by M. R. Siddiqi

Chapter 64: Physics and Mineralogy by Muhammad Abdur Rahman Khan

Chapter 65: Chemistry by Salimuzzaman Siddiqi and S. Mahdihassan

Chapter 66: Natural History by Seyyed Hossein Nasr

Chapter 67: Medicine by K. S. Shah

Book Six

INFLUENCE OF MUSLIM THOUGHT

Chapter 68: Influence of Muslim Thought on the West:

Western Thinkers on Islam in General

Theological Influence

Philosophical Influence before Descartes by H. Z. Ulken

Philosophical Influence from Descartes to Kant by M. M. Sharif

Philosophical Influence in the Post Kantian period by H. Z. Ulken

Chapter 69: Influence of Muslim Thought on the East by C. A. Qadir

Book Seven

THE DARK AGE: (1111/1700-1266/1850)

Chapter 70: Decline in the Muslim World by C. A. Qadir

Chapter 71: The Silver Lining: Development of the Urdu Language, Grammar, and Literature by S. M. Abdullah

Book Eight

Modern Renaissance (Covering both the Early and the Later Centuries)

Part 1: renaissance in the near and middle east

Chapter 72: Renaissance in Arabia, Yemen, Iraq, Syria and Lebanon: Muhammad Bin 'Abd al-Wahhab and His Movement by Abdul Hamid Siddiqi

Chapter 73: Renaissance in North Africa: The Sanusiyah Movement by Muhammad Khalil

Chapter 74: Jamal al-Din al-Afghani by Osman Amin

Chapter 75: Renaissance in Egypt: Muhammad Abdu and His School by Osman Amin

Chapter 76: Renaissance in Turkey: Zia Gokalp and His School by Niazie Berkes

Chapter 77: Renaissance in Iran: General by Abdul Shakoor Ahsan

Chapter 78: Renaissance in Iran: (Continued) Haji Mulla Hadi Sabziwari by Seyyed Hossein Nasr

Part 2: renaissance in south and south-east asia

Chapter 79: Renaissance in Indo-Pakistan: Shah Wali Allah Dihlawi by Abdul Hamid Siddiqi

Chapter 80: Renaissance in Indo-Pakistan (Continued): Sir Sayyid Ahmad Khan as a Politician, Historian and Reformist by Abdul Hamid

Chapter 81: Renaissance in Indo-Pakistan (Continued): Sir Sayyid Ahmad Khan as a Religio-Philosophical Thinker by B. A. Dar

Chapter 82: Renaissance in Indo-Pakistan (Continued): Iqbal by Khalifah Abdul Hakim

Chapter 83: Renaissance in Indonesia by Shaikh Abdur Rashid

CONCLUSION by the Editor, M. M. Sharif

Table of Contents

**A History of Muslim Philosophy Volume 2, Book 4: Later Centuries
(From the Fall of Baghdad [656/1258] TO 1111/1700)..... 19**

Part 1. The Fall of Baghdad 20

Chapter 40: Fall of The ‘Abbasid Caliphate 21

 Bibliography 25

 Notes 26

Part 2. Theologico-Philosophical Thought 28

Chapter 41: Ibn Taimiyyah 29

 A. Life and Works 29

 B. Attitude towards Theology and the Theologians..... 31

 Ibn Taimiyyah’s Anthropomorphism..... 33

 Al-Qur’an Kalam Allah Ghair Makhluq..... 34

 C. Attitude towards Philosophy..... 35

 Theory of the Atom 42

 Theory of the Body 42

 Theory of the Similarities of Bodies..... 42

 Theory of Motion 43

 Theories of Harakat al-Falak, Namus, and Mumkin 44

 Notes 48

Part 3: The Sufis 51

Chapter 42: Jalal al-Din Rumi..... 52

 A. Life 52

 B. Beliefs and Philosophy 57

 C. The Nature of Existence and Evolution 58

 D. Love..... 62

 Bibliography 70

 Notes 70

Chapter 43: Mahmud Shabistari, Al-Jili, and Jami 71

 A. Mahmud Shabistari 71

 B. Al-Jili..... 74

 Essence, Attributes, and Names 74

 1. Life 78

 2. Knowledge 79

 3. Will 80

 4. Power 80

 5. Speech (Kalam) 81

 6. Hearing is Divine Epiphany..... 82

 7. Sight 82

 8. Beauty 82

 9. Majesty is Beauty in its Intense Form 82

 10. Perfection is the name of Divine Essence which is perfectly
 unknowable 82

 Self-revelations of the One 82

 Ascent of the Soul..... 84

**A History of Muslim Philosophy Volume 2, Book 4:
Later Centuries (From the Fall of Baghdad
[656/1258] TO 1111/1700)**

Part 1. The Fall of Baghdad

Chapter 40: Fall of The ‘Abbasid Caliphate

Chapter 40: Fall of The ‘Abbasid Caliphate

The Mongol invasion, which shook the world of Islam to its very foundations in the seventh/13th century was an unprecedented phenomenon in the history of mankind. A people, hitherto unknown even to their neighbours, poured forth from the bare and bleak plateau of Karakorum (Mongolia) and with lightning speed overran the Asian and European continents from China to Hungary and East Prussia, and built up the largest empire know to man. These people were the Mongols¹ or Tartars as called by their contemporaries. Their invasion inflicted more suffering on the human race than any other incident recorded in history. They lived in a wild and primitive state of society. “They are,” says Matthew Paris, “inhuman and beastly, rather monsters than men, thirsty for and drinking blood, tearing and devouring the flesh of dogs and men...They are without human laws.”²

The Mongol storm burst on the Muslim world in two separate waves. The first dates back to 616/1219 when Chingiz Khan³ (550/1155 - 625/1227), who first as the leader of a band of adventurers and later installed as their ruler in 603/1206 welded these barbarians into a strong and well-disciplined military force, attacked the Empire of the Khwarizm Shahs (470/1077 - 629/1231) which at the height of its power stretched from the Ural Mountains to the Persian Gulf and from the Euphrates to the Indus excluding the two Iranian provinces of Khuzistan and Fars. The second wave broke on Khurasan in 654/1256 when Chingiz Khan’s grandson, Hulagu Khan (614/1217 - 664/1265), was selected by his brother, Emperor Mangu Khan (649/1251 - 655/1257), and the great quriltay, i.e. the Mongol assembly, held in 649/1251, to annihilate the ‘Abbasid Caliphate of Baghdad and the Isma‘ilis of Alamut and Quhistan in North Iran.

The first invasion, which probably could not have been averted, was provoked by a further incident in which the Governor of Utrar,⁴ a frontier town in Khwarizm, murdered a number of Mongol tradesmen alleged to have been spies. Thereupon Chingiz Khan despatched an embassy consisting of two Mongols and one Turk to the Court of ‘Ala al-Din Mohammad Khwarizm Shah (596/1199 – 617/1220) to protest against this violation of the laws of hospitality and demanded that he should hand over the Governor to them or prepare for war. In reply Khwarizm Shah behaved in a queer fashion which was both foolish and arrogant. He killed the Turk and turned back the two Mongols with their beards shaved off. Upon this the Mongols held a quriltay and decided to attack Khwarizm.

This was not the only evidence of Khwarizm Shah’s suicidal policy. According to the contemporary historian, ibn Athir (d. 632/1234), ‘Ala al-Din Mohammad had already destroyed or weakened the neighbouring Muslim States in order to build up an unstable, sprawling empire, so that in the dark hour of trial when, instead of showing any signs of resistance, he adopted the ignominious course of continued retreat, and left his unfortunate subjects at the mercy of the relentless enemy, there was no Muslim power left to protect or defend them. His gallant son, Jalal al-Din Mankoburni (617/1220 - 629/1231), however, put up stiff resistance against the full might of the Mongol attack and for years continued to show acts of great

heroism in unequal battles until, unaided and deserted, he met his tragic end. By his desperate and indomitable courage against the Mongol blast of death, the dauntless prince has left a permanent mark of gallantry in the annals of Muslim history.

A big factor which hastened the Muslim downfall was the atmosphere of intrigue prevailing in the Muslim world on the eve of the Mongol invasion. According to ibn Athir and al-Maqrizi (766/1180 - 846/1442), the 'Abbasid Caliph al-Nasir (576/1180 - 622/1225) actually encouraged the Mongols to attack Khwarizm, little knowing that his own house was destined to perish at the hands of the same irresistible foe.

The storm burst in 616/1219 and soon engulfed Transoxiana, Khwarizm, Khurasan, the territories lying north of the river Indus, and North Iran, until, instead of turning south or west, it swept across the Caucasus into South Russia, finally to advance as far away as the Baltic and the Adriatic.

The second wave of invasion struck Khurasan at the beginning of 654/1256; the Caliphate of Baghdad was destroyed in 656/1258 by Hulagu Khan who had earlier wiped out the Isma'ili stronghold at Alamut in North Iran in 654/1256. The Mongol army advanced further into Syria, sacked Aleppo, and threatened Damascus into surrender in 659/1260. It was at 'Ain Jalut (Goliath's Spring) near Nazareth, however, that the Mongol tide was firmly stemmed by the gallant Mamluks of Egypt who gave them a crushing defeat in 659/1260. After the death of Jalal al-Din Mankoburni this was the first Muslim victory in 30 years and it broke the spell of the Mongol invincibility.

The Mongols were essentially an engine of destruction. They mowed down all resistance and their opponents "feel to the right and left like the leaves down winter." They have been described by Sir Henry Howorth as one of those races "which are sent periodically to destroy the luxurious and the wealthy, to lay in ashes the parts and culture which grow under the shelter of wealth and easy circumstances."⁵ According to 'Ata Malik Juwaini, Hulagu Khan's secretary, who was appointed Governor of Baghdad after the destruction of the 'Abbasid Caliphate, Chingiz Khan described himself at Bukhara as the "scourge of God" sent to men as a punishment for their great sins.⁶

The bewildering extent of the blood-thirsty ferocity, insatiable thirst for massacre, and devastating destruction which brought unprecedented suffering for the greater portion of the civilized world, would be just impossible to believe, had the facts not been confirmed from different sources, both Eastern and Western.

All historians agree that wherever the Mongols went they exterminated populations, pillaged towns and cities, wreaked special vengeance upon those who dared to resist them, converted rich and smiling fields into deserts, and left behind the smoke of burning towns. In the words of Chingiz Khan himself, quoted by Rashid al-Din Fadh'l Allah, the famous Prime Minister of the Mongol period in Iran and the author of *Jami al-Tawarikh*,⁷ "the greatest joy is to conquer one's enemies, to pursue them, to see their families in tears, to ride their horses and to possess their daughters and wives." In old Mongol traditions there is a story that the future world

conqueror was born with a piece of clotted blood in his hands.⁸ The senseless destruction, cruelty, outrage, spoliation, and the lightning speed of the Mongol attack have been described by Juwaini in the pithy sentence uttered by a fugitive from Merv, “They came and uprooted, they burned, they slew, they carried off, and they departed.”⁹

To have an idea of the brutal lust of conquest and ruthless ferocity shown by the Mongol hordes it would suffice to trace the wonton disregard of human life shown by them in some of the many prosperous cities and towns they ravaged. They reduced to ashes the city of Bukhara which was known for its magnificent palaces, gardens and parks stretching for miles on the banks of the river Sughd, put one million people to the sword in Samarqand, and brutally massacred all the inhabitants of Tirmidh and Sabziwar. Khwarizm suffered an equally tragic fate. According to Juwaini, 1,200,000 people were killed in the city. Amongst the scholars and saints who perished was the famous Shaikh Najm al-Din Kubra (d. 618/1221).

In Balkh the Mongol army came back a few days after the city’s destruction to kill the poor wretches who might have survived the first holocaust, and, having dragged them out of the hiding places, butchered them in the true Mongol fashion. Bamiyan, where a Mongol prince lost his life, was wiped out of existence and orders were issued not leave even babies alive in their wombs. This kind of sadism was not a stray incident, for ibn Athir characterizes the Mongols as a people who “spared none, slaying women, men and children, ripping open pregnant women and killing unborn babies.”¹⁰ At Nasa they made a hecatomb of over 70,000 people. Merv, which was at the height of its glory, suffered, according to ibn Athir, a loss of 700,000 people, but Juwaini puts the figure at 1,300,000, excluding those bodies that were hidden at obscure retreats. The survivors were traced out, as in Balkh and mercilessly killed.

Nishapur, which was like the bright Venus in the galaxy of cities,¹¹ was completely razed to the ground and every living thing, including animals, was massacred. Pyramids of skulls were built as a mark of this ghastly feat of military “triumph.” According to Mirkhwand, 1,047,000 men were butchered in the city in addition to an unknown number of women and children.¹² He adds, however, that 40 artisans and craftsmen were given shelter and transported to Mongolia. In Herat these barbarian hordes set up a new record by putting 1,600,000 men to the sword.

These figures give an idea of the cold-blooded, passionless cruelty of the invaders who, in the words of Matthew Paris, “spared neither age, nor sex, nor condition.”¹³ Juwaini mourns the loss of life in Khurasan in the following words, “Not one-thousandth of the population escaped...if from now to the Day of Judgment nothing hinders the growth of population in Khurasan and ‘Iraq-I ‘Ajam, it cannot reach one-tenth of the figure at which it stood before.”

With the destruction of the scores of cities of fame also perished the priceless treasures of art and literature. The letter of ibn Khallikan (608/1211 - 681/1282) which he wrote from Mosul after his flight from Merv to al-Qadi al-Akram Jamal al-Din Abu al-Hassan ‘Ali, vizier of the King of Aleppo, pathetically describes the nature of the Mongol cataclysm.

In this letter, written in 617/1220, the author pays his last tribute to the libraries of Merv which had made him forget his dear ones, his home, and country, and to the advanced state of civilization in Khurasan which, according to him, “in a word, and without exaggeration, was a copy of paradise.”

He proceeds to laud the achievements of its doctors, saints, scholars, the monuments of science, and the virtues of the authors of this region and then laments the tragedy of Merv in these words, “Those palaces were effaced from the earth...in those places the screech owls answer each others’ cries and in those halls the winds moan responsive to the simoom.” Ibn Athir describes the loss of life and culture in the same strain, “Those Tartars conquered...the best, the most flourishing and the most populous part thereof (the habitable globe), and that whereof the inhabitants were the most advanced in character and conduct.”¹⁴

The reckless assassination of thousands of scholars, poets, and writers, and the destruction of libraries and colleges wrought irreparable disaster upon the Muslim civilization which had flourished for centuries with such remarkable vitality. Transoxiana and Khurasan were the worst sufferers. Fertile plains and valleys in these regions were turned into wilderness. The great highways of Central Asia on which passed the merchandise of China to Western Asia and Europe also lay deserted.

For 20 years after the death of Chingiz Khan in 625/1227, the Mongols continued to pillage Kurdistan, Adharbaijan, and regions to the west of Iran, at times marauding right up to Aleppo. But the Caliphate of Baghdad had survived. The inevitable occurred in 656/1258 when Hulagu Khan stormed Baghdad after he had extirpated the Isma‘ili power at Alamut in 654/1256. The city which been the metropolis of Islam for more than five centuries (632/749 - 656/1258) was given over to plunder and flame. The massacre, according to Diyarbakri (d. 982/1574) in his *Tarikh al-Khamis*, continued for 34 days during which 1,800,000 people were put to the sword. For days blood ran freely in the streets of Baghdad and the water of Tigris was dyed red for miles. According to Wassaf, the sack of Baghdad lasted 40 days.¹⁵ To quote *Kitab al-Fakhri*, “Then there took place such wholesale slaughter and unrestrained looting and excessive torture and mutilation as it is hard to be spoken of even generally; how think you, then, its details?” Al-Must‘asim bi Allah (640/1242 - 656/1258) who was destined to be the last Caliph of this renowned dynasty was beaten to death, and, according to another version, trampled on by horses.

The sack of Baghdad was a supreme catastrophe of the world of Islam and of the Arabo-Persian civilization which had flourished so richly for many hundreds of years. Its magnitude surpassed the devastation of other cities, because the political and psychological implications of this tragedy had a far greater import. The Caliph was regarded as the spiritual and temporal head of the Muslim world and even in its days of decline the caliphate of Baghdad had retained the semblance of Muslim unity and homogeneity. Baghdad, therefore, was more than a city. It was a symbol. With the end of the Caliphate this symbol also vanished. It was also the centre of the most advanced civilization of the time and from it emanated

the rays of knowledge which illuminated the world. The destruction of Baghdad, therefore, meant the extinction of learning.

With it were destroyed the great libraries and unique treasures of art, philosophy, and science, accumulated through hundreds of years. Books were consumed to ashes or thrown into the river. Mosques, colleges, hospitals, and palaces were put to fire. The awful nature of the cataclysm, which completely blocked the advancement of knowledge of Muslim lands, and thus, indirectly the whole world, is, in the words of Percy Sykes, "difficult to realize and impossible to exaggerate."¹⁶ No wonder the great Sa'di (580/1184 - 691/1291) was moved to write in far-off Shiraz an elegy on the destruction of Baghdad and the fall of the caliphate, which has gone down in Persian poetry as one of the most pathetic poems of all times.

What deepened the sombre effects of this tragedy was the fact that, with the extermination of men of learning and the total destruction of Muslim society, the spirit of inquiry and original research so distinctly associated with Arabic learning was practically destroyed. Western Asia was no plunged into darkness as earlier Khurasan and Transoxiana had been wrapped in gloom. The two races - Arabs and Iranians - which together had contributed to the medieval world the highest literary and scientific culture parted ways. For centuries Arabic had been the language of religion, science, and philosophy in Iran, and all thinkers and scientists had chosen Arabic as the vehicle of expressing their thoughts. But henceforth Arabic lost its position of privilege and its use was restricted mostly to the field of theology and scholastic learning. The Arabs themselves lost even the shadow of a major role in Islamic history. The fall of Baghdad, therefore, was also an ominous sign of the loss of Arab hegemony.

The Mongol invasion by its accumulated horror and scant respect for human life and moral values produced an attitude of self negation and renunciation in general and in Persian poetry in particular. The pantheistic philosophy of ibn 'Arabi henceforth made a strong appeal to the minds of subsequent mystics such as Auhhadi Kirmini, Auhadi of Maraghah, and Jami.

The infinite havoc caused by this cataclysm constitutes a melancholy chapter in the history of Muslim civilization. What Juwaini had called the famine of science and virtue in Khurasan¹⁷ came true of all lands stretching from Transoxiana to the shores of the Mediterranean. Never, perhaps, had such a great and glorious civilization been doomed to such a tragic fall. This tragic fall was not, however, a tragic end, for this civilization rose again and produced within two and half centuries three of the greatest empires of the world, and though the main current of its thought changed its course, even before, and long before, its political recovery, it produced the world's first destroyer of Aristotle's logic in ibn Taimiyyah and the first sociologist and philosopher of history in ibn Khaldun.

Notes

1. The word is derived from the root mong which means brave.
2. E. G. Browne, A Literary History of Persia, vol. 3, p. 7.
3. His actual name was Temuchin. The title of Chingiz or Zingis Khan was presented to him by his people in recognition of his rising power. The word zin means great, gis is the superlative termination.
4. Also known as Farab.
5. Henry Howorth, History of Mongols Part 1, P. 10
6. ‘Ata Malik Juwaini, Tarikh-i Jahankusha, Vol. 1, ed. Mohammad ‘Abd al-Wahab Qazwini, Leiden, 1329/1911. p 81. ‘Ala al-Din ‘Ata Malik Juwaini (d. 682/1283) who belonged to a distinguished family of ministers and administrators was one of those Iranian officers whom the Mongols found indispensable in the civil service. He was Hulagu Khan’s secretary and had served him throughout his campaign. He was appointed Governor of Baghdad by Hulagu Khan a year after the conquest of the city and held this office position for 24 years. His famous book which was completed in 658/1260 contains a first-hand account of Hulagu Khan’s military exploits and is one of the most authentic books on the history of this period. It deals with the Mongols, the Khwarizm Shahs, and the Isma‘ili sect and ends with the events of the year 655/1257.
7. Rashid al-Din Fadl Allah (645/1247 - 718/1318), the renowned scholar-administrator of the Il-Khuni (Mongol) period of the history of Iran, served as Prime Minister under three Muslim Mongol rulers, namely, Ghazan (694/1294 - 703/1303) who, along with 10,000 Mongols, embraced Islam on Sha‘ban 4, 694 A. H. and by declaring it the State religion restored its supremacy in Iran; Uljaitu Khuda-bandeh (703/1303 - 716/1316). In spite of his pre-occupation as the Prime Minister of a great empire, Rashid al-Din found time to pursue research and write books, both in Arabic and Persian. Of these his Jami‘ al-Tawarikh, which, in the words of Quatremere, the French editor of portions of this work, “offered for the first time to the people of Asia a complete course of universal history and geography,” is the most celebrated. Though it is a general history of the world, yet it contains a detailed and highly authentic account of the Mongol Emperors from the time of Chingiz Khan to the death of Sultan Ghazan.

Part 2. Theologico-Philosophical Thought
Chapter 41: Ibn Taimiyyah

Chapter 41: Ibn Taimiyyah

A. Life and Works

After having seen the rise and development of theological and philosophical movement in Islam and the contributions made by the theologians and philosophers before the sack of Baghdad, we have now come to a point which may be called the pre-renaissance period in the history of Islam. By ibn Taimiyyah's time theology, philosophy, and jurisprudence had made remarkable progress and given rise to different schools of thought. But, unfortunately, political dissensions and doctrinal differences sapped the unity of the Muslims and made their countries easy prey to Mongol invasions in the seventh/13th century. It was at this critical juncture that Imam ibn Taimiyyah appeared as a mujtahid (one qualified to form an independent opinion in Muslim Law) and called upon the people to go back to the original teachings of Islam as they are found in the Qur'an and the Sunnah of the Prophet.

He had little respect for theology (Kalam) or philosophy and he could not be called a theologian or a philosopher in the truest sense of the terms, though he himself acted as a great theologian and a great philosopher. The excellence of Imam ibn Taimiyyah as an original thinker and a critic has been widely accepted, and he is generally considered to be the forerunner of Wahhabism, Sanusism, and similar other reform movements in the Muslim world.

Taqi al-Din Abu al-'Abbas Ahmad ibn 'Abd al-Halim, commonly known as ibn Taimiyyah, was born in Harran,¹ a city near Damascus, on Monday, the 10th of Rabi' I 861/22nd January 1263.

During the year 667/1269 when ibn Taimiyyah approached the age of seven, the Mongols ravaged the city of Harran, and his father 'Abd al-Halim went to Damascus with all the members of his family and settled there. Here ibn Taimiyyah received an excellent education under his father who was a great scholar of the Hanbalite School. He also studied under 'Ali ibn 'Abd al-Qawi and mastered the Arabic grammar of Sibawaihi. He studied Hadith with more than 200 Sheikhs.² It is noteworthy that among the teachers, whom ibn Taimiyyah mentions in his Arba'un, were four ladies.³

It is difficult to say whether ibn Taimiyyah was influenced by any of his predecessors in his extra-ordinary enthusiasm for introducing social and religious reforms in the Muslim community and for his unsympathetic attitude towards the theologians, the philosophers, and the Sufis. A close examination of his works suggests that he followed none but the early pious Muslims (salaf al-salihun) in formulating his scheme of reform. This is why his movement is often called the Salafi movement. His motto was, "Go back to the Qur'an and the Sunnah of the Prophet." He protested vehemently against all sorts of innovations (bid'ah). He believed that Islam was corrupted by Sufism, pantheism, theology (Kalam), philosophy, and by all sorts of superstitious beliefs. He aimed at purging the Muslim society of practices resulting in undue homage to the tombs of prophets and saints. During his stay in Syria from 692/1292 to 705/1305, ibn Taimiyyah, therefore, wrote books and treatises against the Sufis, the Mutakallimun, and the Aristotelian philosophers.

It was during the early part of this period that he personally took part in the war against the tartars and the Nusairis. In 702/1302, he participated in the battle of Shaqhab (a place near Damascus) where he met Caliph al-Malik al-Nasir, Mohammad ibn Qalawun, the Mamluk Sultan and other notables, and urged them all to join the holy war. Towards the end of 704/1304, he led an army against the people of Jabal Khusruwan in Syria and inflicted a crushing defeat on them. Hence, ibn Taimiyyah can also be called a mujahid (fighter for the cause of Islam). In 705/1305, ibn Taimiyyah faced the criticism of his antagonists in open meetings in the presence of the Deputy of Mamluk Sultan, al-Malik al-Nasir, and defeated them by his clear and cogent arguments. In this very year he proceeded to Cairo and faced a munazarah (legal debate) in which an Indian scholar named Sheikh Safi al-Din al-Hindi played an important part.

It was on the suggestion of this Sheikh that ibn Taimiyyah was ordered to be imprisoned in the dungeon of the mountain citadel with his two brothers for a year and a half.⁴ He also suffered imprisonment at different places for his fatwas (legal decisions) and rasa'il (treatises) against certain social and religious practices; these excited the indignation of the scholars of his time, until at last he was interned in the citadel of Damascus on Sha'ban 726/July 1326. Here his brother Zain al-Din was permitted to stay with him, while ibn Taimiyyah's student ibn Qayyim al-Jauziyyah was retained in the same prison for his support. In this prison, ibn Taimiyyah wrote books and pamphlets defending his own view, and it is said that here he prepared a commentary on the Holy Qur'an in 40 volumes called al-Bahr al-Muhit. Some of these books fell into the hands of his enemies and he was most ruthlessly deprived of his books, and pen and ink, after which he wrote with charcoal. Having been left alone in prison, he passed his time in devotion to God until his death on Monday, the 20th of Dhu'l Qa'dah 728/ 27 September 1328.⁵

Ibn Taimiyyah was a prolific writer. Nobody could give a definite number of his works though al-Kutubi tried to enumerate them under different heads.⁶ He left innumerable books, religious decisions, letters, and notes, most of which he composed while he was in prison. Al-Dhahabi gives the number to be approximately 500.

In his Rihlah, ibn Battutah says that he himself happened to be in Damascus at the time of the last imprisonment of ibn Taimiyyah, and that the Sultan al-Malik al-Nasir released ibn Taimiyyah after the completion of al-Bahr al-Muhit, but on a Friday, while he was delivering the Jum'ah sermon on the pulpit of the city mosque, he uttered the following words, "Verily, Allah comes down to the sky over our heads in the same fashion as I make this descent," and he stepped down one step of the pulpit. This was vehemently opposed by a faqih (jurist), but ibn Taimiyyah had his supporters who attacked the fiqih and beat him severely with fists and shoes, causing his turban to fall down to the ground and making his silken shashia (cap) visible on his head.

People objected to his wearing the silken cap and brought him to the house of the Hanbalite Qadi 'Izz al-Din ibn Muslim, who ordered him to be imprisoned and put to torture. But the Maliki and the Shaf'i doctors

disapproved of this judgment, and brought the case to the notice of Saif al-Din Tankiz, one of the best and most pious nobles of Damascus, who forwarded the matter to al-Malik al-Nasir along with some other charges against ibn Taimiyyah, such as his decision (fatwa) that a woman divorced by triple repudiation in one utterance will receive one talaq only and that one taking the journey to the tomb of the Prophet should not shorten his prayers. The Sultan, convinced of these charges, disapproved of ibn Taimiyyah's standpoint and ordered him to be thrown into the dungeon again.⁷ This report of ibn Battutah is not chronologically sound. It will be discussed again in connection with the charge of anthropomorphism against ibn Taimiyyah.

Though ibn Taimiyyah was not successful in his mission during his lifetime, it became clear at his funeral that he exercised a great influence upon the public. It is said that more than two lacs of men and women attended his funeral ceremony. Except three persons who were afraid of being stoned to death for their hostility towards him, all attended his funeral and the military had to be called in to guard the crowd.⁸

B. Attitude towards Theology and the Theologians

Ibn Taimiyyah has left us a number of books and treatises on theology, but in none of them is he systematic in his treatment of the subject. Problems of theology and philosophy are scattered throughout his writings, and, according to al-Kutubi's enumeration, many of them have not yet seen the light of day.⁹ A number of manuscripts left by ibn Taimiyyah on theology are also available in England and Germany among which are his *Mas'alat al-'Uluw*, *al-Kalam*, *'ala Haqiqat al-Islam*, *Su'al li ibn Taimiyyah*,¹⁰ etc., etc.

In his *Minhaj*¹¹ as well as other books, ibn Taimiyyah boldly declares that theology and philosophy have no place in Islam, and that theologians like al-Juwaini,¹² al-Ghazālī, and al-Shahrastani¹³ who devoted their lives to these sciences, ultimately understood their defects and returned to the Qur'an and the Sunnah. Shahrastani, he adds, confessed that it was folly to discuss theology, al-Razi, in his opinion, contradicts himself in matters of theology and admitted his perplexity.

In the *Minhaj*¹⁴ as well as in his *Majmu'at al-Tafsir*,¹⁵ ibn Taimiyyah cites the opinion of Imam Ahmad and Abu Yusuf who said that he who would seek knowledge by the help of scholastic theology (Kalam) would turn into an atheist. He also mentions the opinion of Imam Shafi'i that theologians should be beaten with shoes and palm-branches, and paraded through the city so that people may know the consequence of the study of theology.

In his *Tafsir Surat al-Ikhlās*,¹⁶ he tells us that the early leaders (aslaf) tabooed theology since it was vanity, falsehood and saying unfitting things about God.

Among the later thinkers Imam Ash'ari (d. 330/941) defended theology in his *Risalah fi Istihsan al-Khaud fi al-Kalam*. In it, he supported the theories of *harakah* (motion), *sukun* (rest), *jism* (body), *'ard* (accident), *ijtima'* (union), *iftiraq* (separation), etc., by the help of the Qur'an. In his opinion, all religious orders, be they relating to action or belief, have been

based on rational arguments and, thus, it is not unlawful to enter into discussion with them.¹⁷ But ibn Taimiyyah considered the above theories to be Hellenistic and against the Qur'an and the Sunnah.

About the Jahmites,¹⁸ ibn Taimiyyah quotes the views of Imam Ahmad who said that they told lies about God when they denied attributes to Him, and spoke about Him through ignorance. Abu al-'Abbas ibn Suraij, he adds, disapproved of the theories of atoms and accidents. Once, in answer to a questions raised in Kalam, he said, "The doctrine of the unity of God to the vain of the people is to enter into discussion of atoms and accidents (jawahir wa a'rad)." These terms did not exist in Islam during the time of the Prophet. It was the Jahmites and the Mu'tazilites who first invented them; Ja'd ibn Dirham¹⁹ was mainly responsible for this invention. This Ja'd was executed by ibn 'Abd Allah ibn al-Qasri²⁰ at Wasit on account of Kalam (theology). The story goes that before executing Ja'd, ibn 'Abd Allah stood on a pulpit (minbar) and addressed the people saying, "Oh men, offer your sacrifice to God. Surely I am offering my victim in the person of Ja'd who says that God did not take Abraham as His friend, nor did He speak to Moses. God is far above what Ja'd attributes to Him." He then got down from the pulpit and cut off Ja'd's head.²¹

Ibn Taimiyyah refutes the view of al-Imam Hilli who expressed in his Minhaj al-Karamah²² that Hadrat 'Ali was the originator of theology. Ibn Taimiyyah opposes this theory as 'Ali could not go against the Qur'an and the Sunnah, and none among the Companions (Sahabah) or their followers (Tabi'un) ever discussed the phenomenal nature of the world as derived from the origination of bodies (huduth al-ajsam). He repeats that theology came into existence at the end of the first/seventh century. It was Ja'd ibn Dirham and Jahm ibn Safwan who introduced it, and eventually the students of 'Amr ibn 'Ubaid like Abu al-Hudhail al-'Allaf and others carried it on. The object of 'Amr and Wasil in propagating the above theory was to introduce into Islam the idea that God's power is not unlimited and that sinners will abide in hell forever.²³

From the foregoing statements, it is evident that ibn Taimiyyah generally uses Kalam in its pre-Ash'arite sense of Mu'tazilite theology, though later he does not spare the Ash'rite views either.

Let us now discuss the divine attributes with reference to ibn Taimiyyah's refutation of the Jahmite and the Mu'tazilite views.

According to ibn Taimiyyah, it was Ja'd ibn Dirham, a Jahmite, who first professed that "God is not seated on His Throne, "and that istiwa' means istaula," that is, God is the master of His Throne and not that "He is settled on it." This idea was then taken up by Jahm ibn Safwan (d. 128/745). Consequently, a new system of scriptural interpretation became popular at the close of the second/eighth century at the hand of Bishr ibn Ghiyath al-Marisi (d. 218 or 219/833 or 834) and his followers.²⁴ The Mu'tazilite doctrine of divine attributes was publicly preached during the last part of the third/ninth century²⁵ and then the Shi'ite doctors, Mufid,²⁶ Musawi,²⁷ and Tusi²⁸ adopted it.

The beliefs that God is eternal and that "He exists without His attributes" are dogmas of the Jahmites and the Mu'tazilites. In regard to God's

knowledge, power, seeing, hearing, etc. the older ultra-Imami sect was downright anthropomorphist, while subsequent generations went further and denied the existence of all divine attributes.²⁹ The Karramites,³⁰ in his opinion, were anthropomorphises. The Sunnites were unanimous in declaring that God was totally unlike men in His essence, qualities, and actions. The traditionists, the hermeneutists, the Sufis, the four jurists and their followers, never believed in anthropomorphism. The accusation that has been levelled at jurists like Malik, Shafi‘i, Ahmad and their followers, is based on sheer misunderstanding. These jurists in affirming the divine attributes never maintained that these attributes resembled bodily forms.³¹

Ibn Taimiyyah further maintains that the word qadim (eternal) relating to God, on which the Jahmites and their followers base their arguments, has not received a place among His asma’ al-husna (beautiful names) though the word awwal (first) is one of them. Awwal does not signify that God alone exists without His attributes from eternity and pre-existence. The attributes that are always associated with God’s eternity needs some additional eternal essence. The statement that the divine attributes are additional to His essence (dhat) is to be taken in the sense that they are additional to the concept of the essence held by the nufat (deniers of God’s qualities) and not in the sense that there is in God an essence denuded of attributes and the attributes are separate from and additional to the essence.³² For example, whenever an attribute is attached to a locus (mahall), its relation is established with the object itself and not with anything else.

When a thing is associated with blackness and whiteness, is set in motion, it is sure to move with those qualities alone and not with anything else. God, to who are attributed speech, volition, love, anger, and pleasure, must actually be associated with all of them without any additional qualities that have not been ascribed to Him. One who is speechless, motionless or inactive cannot be called speaker (mutakallim), mover (mutaharrik), or doer (fa‘il). So to attribute life, power, knowledge, etc., to God without associating them with His essence, as the Jahmites and their followers do, indicates that God lives without life, is powerful without power, and knows without knowledge, while the Qur’an and the Sunna abound with proofs that God is associated with His attributes.³³

Ibn Taimiyyah’s Anthropomorphism

From the above discussions and the similar contents of his al-‘Aqidat al-Mamawiyyat al-Kubra,³⁴ people misunderstood ibn Taimiyyah and suspected him to be an anthropomorphist. They thought that he taught, according to the literal meaning of the Qur’an and the Sunnah, that God has hands, feet, face, etc., and that He is settled on His Throne. The objection of the theologians was that if God possessed limbs and sat on the Throne, then He must be possessed of spatial character (tahayyuz) and subject to division (inqisam). Ibn Taimiyyah refused to admit that “spatial character” and “divisibility” are the essence of bodies (ajsam). Ibn Battutah’s statement that in Damascus he heard ibn Taimiyyah addressing the people saying, “Verily, God descends to the sky over our world (from heaven) in the same way as I make this descent,” while he stepped down one step of the pulpit, is nothing but a canard.

This story, as we have noticed,³⁵ has been so skilfully concocted that it appears to be a real occurrence. But when we examine this report, we cannot believe that such a thing could have happened during the visit of ibn Battutah to Damascus. Ibn Battutah, as we understand from his own description, entered Damascus on the 19th of Ramadan 726/23 August 1326, whereas ibn Taimiyyah had been imprisoned more than a month earlier (on the 26th of Sha‘ban of the same year) without being allowed to come out before his death in 726/1328.³⁶ In his *al-Aqidat al-Tadmuriyyah*,³⁷ ibn Taimiyyah clearly states, “Whoever considers God to be similar to the body of men or an originated thing to be similar to Him, is telling a lie about God. He who maintains that God is not a body and means by it that no originated thing is similar to Him is right, though the word body (*jism*) is applied here is an innovation (*bid‘ah*).”

He further says that we should say of God what He has said of Himself or what the Prophet has said about Him, and declares that the early Muslims ascribed to God attributes “without asking how” (*bila kaif*), and without drawing analogy (*tamthil*), or making alterations (*tahrif*), or divesting Him of His attributes (*ta‘til*).³⁸ Ibn Taimiyyah believes in “God’s settling Himself on His Throne, as it befits Him, without any resemblance to human action. He quotes the opinion of the early Muslims who stood between *ta‘til* and *tamthil*.³⁹

The above evidence clearly shows that in his interpretation of the divine attributes, ibn Taimiyyah attempted rather to guard himself against the charge of anthropomorphism. While refuting the Jahmite and the Mu‘tazilite conception of the divine attributes, he vehemently opposed their views which divested God of the Qur’anic expressions of face, hands, etc, as understood by the Arabs and attempted to substitute the usual meanings of these expressions by metaphorical interpretations. In his opinion, it would be absurd to suppose that the later generations should have a deeper insight into a better understanding of the divine attributes than the Prophet and his Companions who never attempted to explain them in terms of philosophy. It is for this reason that he attacked the theologians who attached the highest value to human reason as a criterion for understanding the divine attributes. Unlike other European scholars, H. Laoust is also of the opinion that the charge of anthropomorphism against ibn Taimiyyah is incompatible with his methodology and with “the positive content of his theodicy.”⁴⁰

Al-Qur’an Kalam Allah Ghair Makhluq

Al-Qur’an Kalam Allah Ghair Makhluq (The Holy Qur’an is the Uncreated Word of God)

With regard to this problem, ibn Taimiyyah not only accuses a section of people of maintaining that the Qur’an is created, but goes a step further and interprets words *ghair mukhluq* (uncreated) as eternal (*qadim*). He considers this an innovation (*bid‘ah*) which resulted from their controversies with the Mu‘tazilites and Kullabites in defining the uncreatedness of the Qur’an. Such a theory was unknown to the early Muslims. It was Ja‘d ibn Dirham along with Jahm ibn Safwan who first introduced the heretical theory that the Qur’an is created, whereas it is the Word of God, and so uncreated.⁴¹

Wahi (Revelation)

Ibn Taimiyyah admits the commonly accepted view as to the three forms of revelation received by the Prophet: received (1) in waking state as well as in dreams, (2) from behind a veil, and (3) through an angel.⁴² But to these he adds a fourth, namely, revelation common to all (al-wahi al-musharak), prophets and others. This he derives from a saying of ‘Ubadah ibn Samit and from the verses in the Qur’an which speak of revelation to people other than prophets;⁴³ for example, God speaks with His servants in their dreams. It is this common revelation which the philosophers like ibn Sina and others are said to have gained.

But he emphatically denies that Aristotle had any share in prophecy. His contemporaries were worshippers of planets and were unaware of the prophets like Abraham or Moses. Unlike Empedocles, Pythagoras, Socrates, and Plato who believe at least in the origination (huduth) of the celestial spheres, Aristotle professed “the doctrine of the eternity of the heavens,” which, according to ibn Taimiyyah, clearly shows that he had no share of wahi al-mushtarak, mentioned above.⁴⁴

C. Attitude towards Philosophy

In his refutation of Aristotelian metaphysics and logic, ibn Taimiyyah left the following independent books in addition to what he wrote against them in many other writings:

1. Kitab al-Radd ‘ala al-Montiyyin, edited by ‘Abd al-Samad Sharaf al-Din al-Kutubi, Bombay, 1949.
2. Bayan Muwafiqat Sarih al-Ma‘qul li Sahih al-Manqul on the margin of Minhaj al-Sunnah, four volumes, Cairo, 1321/1903.
3. Naqd al-Montiz, edited by Sheikh Mohammad Hamid al-Faqqi, Cairo, 1370/1951.⁴⁵
4. Al-Radd ‘ala Falsulafat-i ibn Rushd published at the end of Fasl al-Makal and al-Kashf of ibn Rashd, Cairo, n.d.
5. Kitab al-‘Aql w-al-Naql on the margin of his Minhaj al-Sunnah, Cairo, 1321 - 23/1903 - 05.

His Tafsir Surat al-Ikhlās (Cairo, 1323/1905) also sheds sufficient light on his views on philosophy and theology.

Ibn Taimiyyah is not the first man to speak against the unsoundness of Aristotelian philosophy. In his Kitab ‘ala al-Montiyyin, ibn Taimiyyah mentions that Hassan ibn Musa al-Naubakhti, under whom Thabit ibn Qurrah and others translated Greek sciences, had written his Kitab al-Ara’ w-al-Diyanah pointing out the fallacies of Aristotle. Moreover, Hibat Allah ibn ‘Ali Abu Barakat, a courtier of Mustanjid bi Allah, left a book on the refutation of Aristotle’s philosophy.⁴⁶ The famous Muslim physician and philosopher Abu Zakariyah al-Razi (d.c. 313/925) was a great opponent of Aristotle’s philosophy and supported Pythagoras. In his opinion, Aristotle “had not only ruined philosophy but had also perverted its very principles.” Ibn Hazm of Andalus (d. 456/1063) and the Mu’tazilite al-Nazzam (d. 231/845) were also against the philosophy of Aristotle. Abu ‘Ali al-Jubbai’i (d.303/915) left a book in refutation of Aristotle’s book De generatione et de corruptione.⁴⁷

In his Kitab al-‘Aql w-al-Naql, ibn Taimiyyah says, “Look at the followers of Aristotle! They are following him blindly, while many of them

know full well that their master's theories are wrong. Still it is their pious belief which prevents them from refuting them in spite of the fact that many wise men have proved that there are undeniable and indubitable errors in his logical system, and they support them only for the reason that they are associated with his name. In metaphysics also Aristotle and his followers have committed blunders.”⁴⁸

In his Kitab al-Radd ‘ala al-Mantiqiyyin,⁴⁹ ibn Taimiyyah says that, according to Aristotelian logic, knowledge is of two kinds, namely, based on concept (tasawwar) and that on judgment (tasdiq), both of which are either immediate (badihi) or mediate (nazari). It is evident that all kinds of knowledge cannot be immediate or self-evident. Similarly, all kinds of knowledge cannot be mediate or acquired as in that case, to gain the knowledge of a mediate concept; one would have to depend on another mediate concept leading to a circle (daur) or endless chain (tasalsul) both of which are logically impossible. Logicians further hold that the concepts and judgments which are mediate (nazari) require some means to reach them, and, therefore, the way through which concepts are reached, is called hadd (definition), and the way through which judgments are arrived at is called qiyas (syllogism). Hence hadd and qiyas are the two fundamental bases on which the whole structure of Aristotelian logic stands. In order to refute the Aristotelian logic, ibn Taimiyyah endeavoured to demolish the fundamental bases at four points which serve as the four main chapters of his Kitab al-Radd ‘ala al-Mantiqiyyin:

1. The desired concept cannot be obtained except by means of definition (hadd).
2. Definition gives the knowledge of concepts.
3. The desired judgment cannot be obtained except by means of syllogism.
4. Syllogism or ratiocination gives the knowledge of judgment.

It may be noted here that of the above propositions the first and the third are negative, while the second and the fourth are affirmative. The main targets of ibn Taimiyyah's refutation were the “definition” and “syllogism” of Aristotelian logic.

1. The first basic proposition of the logicians that concepts cannot be obtained except by means of definition has been refuted by ibn Taimiyyah on the following grounds:⁵⁰

A. It is a negative proposition for which the logicians have not advanced any proof (dalil). Such a negative proposition cannot be accepted as the basis of positive knowledge. Therefore, the very first proposition of Aristotelian logic is based on a wrong foundation. Hence, such logic cannot be treated as a science which, according to the logicians, only protects human understanding from committing mistakes.

B. When the definition is the word of the definer, the definer will understand the thing defined either with the help of a (previous) definition or without any definition. Now, if he understands the thing defined by a previous definition, then his words in the second definition will be as good as his words in the first definition which will necessarily lead to a circle (daur) or endless chain (tasalsul) in the reasoning process, both of which are

impossible. If he understands the object defined without any definition, then the assertion in the proposition that “concepts cannot be obtained except with the help of definition” stands refuted.

C. People of different branches of learning and professions know their affairs well without taking recourse to definition.

D. No definition universally agreed upon has yet been found. For instance, nobody has so far been able to offer any definition of the two famous terms “man” and “sun” on which all could agree. In philosophy, theology, medicine, grammar, etc. many contradictory definitions have, thus, come down to us.

Now, the logicians maintain that concept is dependent on definition, but as no agreed definition of anything has yet been made, ibn Taimiyyah declares that no concept in the proper sense of the term has yet been formed. Similarly, the logicians believe that judgment is dependent on concept (tasawwur), but since concept has not yet been obtained (in the proper sense of the term), judgment also has not yet been arrived at. The result, in the opinion of ibn Taimiyyah, is the worst type of sophistication.⁵¹

E. Logicians say that the concept of quiddity (mahiyyah) can only be arrived at by definitions which are composed of genus (jins) and differentia (fasl). The logicians themselves have admitted that this sort of definition is either impossible or rarely found. But ibn Taimiyyah opines that the true significance of things may be achieved by men without definition and, therefore, concepts are not dependent on definitions.

F. To the logicians correct definitions are the combination of genus and differentia, but that which is simple and unitary, like each of the “intellects” (‘uql), has no definition; still they define it and hold it to be a concept. This shows that sometimes concepts do not need definition. If this is possible, then the species which are nearer to perception and are visible can be conceived in a way which is surer and better than the type of knowledge which is derived from the combination of genus and differentia.

G. The definition of a thing consists of several terms each of which indicates a definite meaning. Unless a man knows the terms and their meaning beforehand, it is not possible for him to understand the definition itself. For instance, a man who does not know what bread is cannot know it by its definition. Here ibn Taimiyyah makes a distinction between conception (taswir) and differentiation (tamiz) and sides with the Mutakallimun (scholastic theologians) who hold things are actually known by differentiation and not by definition.

H. When the definition is the word of the definer, the definer must have the knowledge of the object defined before defining it. It is, therefore, wrong to say that the conception of a thing depends on definition.

I. Concepts of existing things are derived either through external senses or through internal senses, none of which stands in need of any definition. Here ibn Taimiyyah observes that whatever cannot be known through the senses can be known through valid inference but not through definition.

J. Logicians say that a definition should be rejected by means of refutation and contradiction. Ibn Taimiyyah argues that refutation or contradiction is possible only when one has already formed a conception of

the object defined. So it is proved that concepts may be formed without the help of definition.

K. Knowledge of a particular thing may be self-evident to some, but acquired by others. Similarly, things which are not self-evident to some may be self-evident to others who would, therefore, need no definition for their knowledge of them. Hence it is wrong to say that knowledge depends on definition.

2. The refutation of the second proposition of the logicians, that definition gives the knowledge of concept, forms the second chapter of ibn Taimiyyah's Kitab al-Radd.⁵² In the opinion of ibn Taimiyyah, logicians and scholastic theologians gave different interpretations of definition. Greek logicians and their Muslim and non-Muslim followers claimed that definition contained the description of the object defined, while the prominent scientists held that definition served as a distinction between the object defined and the object not defined. Therefore, definition cannot give the knowledge of a concept. That definition offers true significance of the object defined and gives the knowledge of concept, has been refuted by ibn Taimiyyah on the following grounds.

A. Definition is a mere statement of the definer. For example, when man is defined as "rational animal," it is a statement that may be right or wrong. It is a mere assertion without any proof. The listener may understand it with or without its definition. In the former case, he knows it without proof which may or may be correct, while in the latter case the definition serves no purpose.

B. Logicians say that definition neither rejects the proof nor needs it. Unlike syllogism (qiyas), definition can be rejected by refutation or contradiction. To this ibn Taimiyyah replies that when the definer fails to advance any proof in favour of the correctness of the definition, the listener cannot understand the object defined by a mere definition which may or may not be correct.

C. If the conception of the object defined is attained by the definition, then it is obtained before one has known the correctness of the definition, since the knowledge of the correctness of the definition is not attained except after one has known the object defined.

D. The knowledge of the object defined depends on the knowledge of the thing (named) and of its attributes which the logicians call essential attributes (al-sifut al-dhatiyyah) and names as "the parts of definition," "parts of quiddity," etc., etc. If the listener does not know that the object defined is attributed with those attributes, he cannot conceive it. If he knows that the thing is attributed with those qualities, he has known them without any definition.⁵³

Ibn Taimiyyah then advances four similar arguments and proves that definitions do not offer true significance of the objects defined.⁵⁴

3. The third proposition of the logicians, that judgments cannot be attained except by means of syllogism, has been refuted by our author on the following grounds:⁵⁵

A. It is an uncertain claim and a negative proposition in favour of which they have not advanced any proof. According to ibn Taimiyyah, both the

self-evident (badihi) and the acquired (nazari) forms of knowledge are relative. If some people failed to attain judgments without the help of syllogism, it does not mean that nobody from among the children of Adam knows the judgments without syllogism.

B. Knowledge of a thing does not depend on a particular syllogistic process of thinking. Khabar al-mutawatir (universally accepted traditions and experiences) gives the knowledge of judgments, while syllogism does not. To one a premise is perceptible, while to another it is not. Therefore, its conclusion (natijah) is undependable.⁵⁶ Ibn Taimiyyah admits that when the premises are correct, the conclusions are also correct, but then he does not admit that knowledge depends on syllogism.⁵⁷

C. According to the logicians, the syllogistic process of gaining knowledge requires two premises, but ibn Taimiyyah says that such knowledge may be attained by one, two, three, or even more premises according to the needs and requirements of an argument. Some persons, he adds, may not require any premise at all, since they know the matter by some other source (e.g. intuition). The saying of the Prophet, “Every intoxicating thing is wine, and all kinds of wine are unlawful,” does not, in any way, support the syllogistic process of thinking in Islam. The prophet never adopted such a process in gaining knowledge of a thing. Every Muslim knows that wine (khamr) is unlawful, and he does not stand in need of two premises to prove that all intoxicating drinks are unlawful.⁵⁸ The very first figure of syllogism, therefore, says ibn Taimiyyah, does not require the roundabout way of inference for obtaining the conclusion.⁵⁹

The logicians claim that ratiocination gives the benefit of perfect knowledge, and that it deals with the knowledge of “universals,” the best of which are the ten intellects (al-‘uqul al-‘ashrah) which do not accept any change or alteration and through which the soul (al-nafs) attains perfection. The “universals” are attained by intellectual propositions which are necessary such as “All men are animals,” and “Every existing thing is either necessary or possible,” and the like which do not accept any change. Ibn Taimiyyah opposes this claim on the following grounds:⁶⁰

A. According to the logicians, since ratiocination deals with intellectual matters having no connection with the physical world, it gives no knowledge of existing things. We may, therefore, consider it useless for all practical purposes.

B. Ratiocination does not help us in understanding the Necessary Existent (wajib al-wujud), the ten intellects (al-‘uqul al-‘ashrah), the heavens (al-aflak), the elements (‘anasir arba‘ah), or the created things (muwalladat) in the animal, vegetable, and mineral kingdoms.

C. The science of divinity to the logicians is not the knowledge of the Creator nor that of the created. They call it metaphysics (‘ilmu ma ba’d al-tabi‘ah), but some name it as “the science of divinity,” the subject-matter of which is the “simple universals” which they divide into “necessary, possible, eternal, accidental, essence, accident,” all of which have no existence in the physical world.⁶¹

Ibn Taimiyyah then traces the origin of logic to geometry. He, therefore, says that:

D. Logicians gave the geometrical forms of argumentation in their logic and called them “terms” (hudud) like those of Euclid’s geometry in order to transfer this method from the physical object to the intellectual one. This is due to the bankruptcy of their intellect and their inability to derive knowledge through a direct process. But Allah has given the Muslims more knowledge and perspicuity of expression combined with good action and faith than to all classes of people.⁶²

The logicians admit that divine knowledge is not objective. It follows that it has no existence either in the intellectual or in the physical world. It is a “universal knowledge” which does not exist except in the imagination. Therefore, there is nothing in this knowledge for the perfection of the soul.

E. Perfection of the soul depends on both knowledge of God and virtuous action (‘amal salih), and not on philosophy. Knowledge alone cannot elevate the soul. Good action must be there, because the soul has two functions, one theoretical and the other practical. Service to God consists of knowledge of God and love for Him, and God sent the prophets to call people to worship Him. Similarly, faith (iman) in God does not mean knowledge of God only, as the Jahmites believe. It consists of both knowledge and practice.⁶³

F. The fourth proposition of the logicians, that syllogism or ratiocination gives the knowledge of judgments (tasdiqat), has been refuted by ibn Taimiyyah in the fourth section of his book where he discusses the topic elaborately in about 300 pages.⁶⁴ In this section, the author seeks to prove the futility of syllogism in attaining knowledge, and often ridicules the renowned logicians by citing their alleged death-bed recantations.⁶⁵ Here he repeats in a new way almost all that he has said in the previous chapters about definition and syllogism of Aristotelian logic and brings in many irrelevant topics in favour of his arguments. He considers that syllogistic process of thinking artificial and useless. In his opinion, God has endowed human beings with “necessary knowledge” to understand their Creator and His attributes. But men invented, from very early times, various sciences which the Shari‘ah of Islam does not require for the guidance of mankind.⁶⁶

Syllogism, as has been said before, does not give us the knowledge of existing things even when it is apparently correct. Sure knowledge or judgment may be attained even by a single premise without undergoing the syllogistic process. Here, ibn Taimiyyah blames the philosophers who, from differences in the movements of the stars, inferred that there are nine heavens and that the eighth and ninth heavens are the kursi (Chair) and ‘arsh (Throne) of God, respectively. He hates Aristotle and his followers for believing in the eternity of the world (qidam al-‘alam), though most of the philosophers were against this view. They put forward further different theories regarding the life-span of this world based on the calculations of the movements of the heavens. Some said that the world would be destroyed after 12,000 years, while others held that it would last up to 36,000 years, and so on. To ibn Taimiyyah, these inferences were baseless and unfruitful.⁶⁷

Ibn Taimiyyah considers Aristotle to be ignorant of the science of divinity, and accuses ibn Sina of having adulterated it with heretical views

of the Batiniyyah who interpreted Islamic Shari‘ah according to their whims and false ratiocination. Some of them, according to our author, said that the Prophet was the greatest philosopher, while others went so far as to say that the philosophers were greater than the prophets. Sufis like ibn ‘Arabi, ibn Sab‘in, al-Qunawi, Tilimsani, etc. followed these heretical views of the Batiniyyah and used Islamic terms in naming their theories. Some of these Sufis, namely, ibn Sab‘in and his followers, did not distinguish between Islam and other religions like Christianity and Judaism. Followers of any religion could approach them and become their disciples without changing their faith.⁶⁸

To ibn Taimiyyah, knowledge of the particular is surer than knowledge of the universal. Therefore, there is not much benefit in the study of inductive logic in which knowledge of the individuals leads to knowledge of the universal. Moreover, knowledge of the individual is derived more quickly than knowledge of the universal which is often gained (by common sense or intuition) without undergoing any syllogistic process.⁶⁹

Ibn Taimiyyah opines that in syllogism (qiyasw) conclusion may be drawn out of one term only, and that it does not require *sughra* and *kubra* (minor and major) terms for drawing conclusions, because he who knows the universal quality is available in every individual.⁷⁰ Ibn Taimiyyah further believes that the teachings of the prophets include all the scriptural and the rational proofs. In support of his view, he cites a number of Qur’anic verses, e.g.:

“Lo, those who wrangle concerning the revelation of Allah without a warrant having come unto them, there is naught else in their breasts but (the quest of) greatness, which they shall never attain to.”⁷¹

“And when their messengers brought them clear proofs (of Allah’s sovereignty), they exalted in the knowledge they (themselves) possessed and that which they were wont to mock befell them.”⁷²

Keeping in view the real existence of concepts, ibn Taimiyyah adds that the philosophers divided knowledge of things into three classes: physical, mathematical, and philosophical. Of these, philosophical knowledge deals with some theoretical problems relating to the existence of simple universals.⁷³ It has nothing to do with practical purposes and is, therefore, useless.

Ratiocination, in the opinion of our author, does not prove the existence of the Creator. The Universals, according to the logicians, have no independent external existence of a definite being distinguishable from the rest of existence.⁷⁴ Moreover, in syllogism a complete conception of the middle term saves us from logical inference. Because a person, who knows that wine is forbidden and every intoxicating (drink) is wine, certainly knows already that every intoxicating (drink) is forbidden (without going through the syllogistic process of thinking).⁷⁵

Such are the arguments of ibn Taimiyyah in proving his assertion that syllogism does not give us the benefit of a new judgment.

Now, let us see how ibn Taimiyyah refutes the views of the scholastic philosophers by tackling the theories of atom, body, similarity of bodies

(tamathul al-ajsam) etc. and declares that all these are innovations in Islam, and that scholars have failed to come to any agreement about them.

Theory of the Atom

This theory was held by most of the scholastic theologians including the Jahmites, the Mu'tazilites, and the Ash'arites. Some of these atomists held that bodies were combinations of atoms existing by themselves, and that God does not destroy any of them. He destroys only the accidents (a'rad), namely, their union (ijtima'), their separation (iftiraq), their motion (harakah), and their rest (sukun). Others maintained that atoms are phenomenal: God created them ex nihilo, and once they come into existence they are never destroyed, though accidents may be destroyed. This view was held by most of the Jahmites, the Mu'tazilites, and the Ash'arites. Most of them, further, believed that it was supported even by ijma' (consensus). Ibn Taimiyyah rejects this theory on the ground that it is an innovation and that early Muslims knew nothing about it. Further, the theologians are not unanimous; some of them totally deny the existence of atoms and the composition of bodies from them.⁷⁶

Theory of the Body

Some opine that a thing which is definite or which has dimensions is called a body, while others say that it is a combination of two atoms, whereas some people maintain that it is a combination of four atoms or make up to 32. Besides these, a class of philosophers holds that bodies are formed not of atoms but of matter and form, while many other scholastics and non-scholastics profess that bodies are neither a combination of atoms nor of matter and form. Even Imam al-Haramain al-Juwaini (d. 478/1085), the teacher of Imam al-Ghazālī, doubted the combination of matter and form, though it is reported that he himself transmitted this as a view accepted by ijma' (consensus).⁷⁷

Theory of the Similarities of Bodies

This theory is popular among some Muslim philosophers. The upholders of this theory profess that bodies of all kinds are at bottom alike, because they are the combinations of atoms which are themselves like one another. The difference between one body and another is the difference of accidents (a'rad). Ibn Taimiyyah rejects this theory, first, on the ground that it has been refuted by Razi and Amidi along with many other philosophers. Secondly, because al-Ash'ari also rejects it in his Kitab al-Ibanah for being a theory of the Mu'tazilites. Thirdly, because the upholders of this theory, in accordance with the principles of the Jahmites and the Qadarites, maintain that each individual body God gives accidents (a'rad) peculiar to itself. According to them, the species (ajnas) cannot change from one into another. A body does neither turn into accidents nor one species of accidents into another.

If it is argued against them (the philosophers) that since all bodies are phenomenal and all phenomenal things turn from one to another, it necessarily proves the change of species, they would say in reply that matter (maddah) in all kinds of creation is the same. It is the qualities (sifat) that change due to union (ijtima'), separation (iftiraq), motion (harakah), and rest

(sukun), while matter (maddah) remains unchanged at all stages of creation. To ibn Taimiyyah, this argument is a mere assumption of the philosophers who have observed only the phenomenal change in things without having any knowledge whatsoever of the essence which they claim remains unchanged. These philosophers, ibn Taimiyyah continues, further assert that all things are combinations of atoms preserved in matter, and then created afresh, while the other maintains that the parts of a body are separated but will again be united in the next world. Unfortunately, the latter have to answer a riddle.

If a man is eaten up by an animal (say a fish) and then the animal is eaten by another man, then how would he be raised on the Day of Resurrection? In reply, some of them say that in the human body there are certain parts that cannot be dissolved and in these parts there is nothing of that animal which has been eaten by the second man. Ibn Taimiyyah objects to this and points out that according to the scientists ('uqala') there is nothing in the human body that cannot be dissolved and that, according to the aslaf (earlier writers), the fuqaha (jurists) and also the people in general, one body (jism) turns into another by losing its identity completely. On the basis of this the jurists discussed the problem whether an impure thing may become pure when it is changed into another. For example, they agreed that if a pig falls into a salt-mine and becomes salt, it will be lawful for a Muslim to eat that salt. Thus, ibn Taimiyyah comes to the conclusion that the arguments in favour of the theory of the similarity of bodies are not sustainable. He believes that bodies are dissimilar and inter-changeable.

Theory of Motion

Philosophers among the Jahmites and the Mu'tazilites have argued about the origination of bodies (huduth al-ajsam) from the story of Abraham, who refused to call the stars, the moon and the sun his lords (rubub).⁷⁸ They hold that Abraham did not worship these heavenly bodies simply on the ground of their motion and shift (al-harakat w-al-intiqal) as suggested by the word uful in the Qur'an.⁷⁹ In other words, they maintained that motion and shift are the distinctive signs origination of bodies.⁸⁰ Ibn Taimiyyah rejects the theory on the following grounds:

1. No such theory was maintained by the Muslim scholars nor is there any indication anywhere that Abraham's people ever thought of it. Why Abraham's people worshipped the heavenly bodies may be attributed to their superstitious beliefs that they would bring them good luck and save them from evil. That is why Abraham said, "Oh my people, I share not with you the guild of joining gods with God."⁸¹

2. To the Arabs the word uful means setting (of the sun, the moon, etc.) and being covered by veils. They did not mean by it "motion" and "shift" as understood by these philosophers.

3. "Motion" and "shift" in the heavenly bodies exist at all times. There was no reason for Abraham to ascribe "motion" and "shift" to the heavenly bodies only at the time of their disappearance. He could recognize them even before they disappeared from the sky. It was on account of such misinterpretations that ibn Sina arrived at the wrong conclusion that

“disappearance is the possibility of existence and everything the existence of which is possible is liable to disappear.”⁸²

The theory of indestructible atoms held by the philosophers goes against the agreement of the learned people (‘uluma’) that one thing may turn into another and that the atoms have no existence, just as the intellectual atoms (al-Jawahir al-‘aqliyyah) of the Peripatetics is mere conjectures.⁸³

The actual cause of the divergence of opinion among the ‘ulama’, as suggested by ibn Taimiyyah, was their invention of certain equivocal terms. For example, what is an indivisible atom? It is obvious that most intelligent people have failed to conceive it. Those who are supposed to have understood it could not prove it, and those who were said to have proved it had to take shelter under long and far-fetched interpretations.⁸⁴ None of the Companions of the Prophet nor their Successors nor anyone prior to them in natural religion (din al-fitrah) ever spoke about indivisible atoms. Naturally, therefore, it cannot be suggested that those people ever had in mind the term “body” and its being an assembly of atoms. No Arab could conceive of the sun, the moon, the sky, the hills, the air, the animals and the vegetables being combinations of atoms. Was it not impossible for them to conceive of an atom without any dimension? The traditionists, the mystics and the jurists never thought of such doctrines.⁸⁵

Theory of the Necessary Cause (Mujib bi Dhat)

Ibn Taimiyyah refutes the philosophical interpretation of the necessary cause. He says that if by “necessary cause” the philosophers mean an existence which has no “will” and no “power,” then such an existence bears no meaning, nor has it any significance externally, much less can it be existing necessarily. Ibn Rushd and other philosophers contradict themselves in their discussion of this problem. They postulate at the outset “a final cause” or ‘illat al-ghayah and then other final causes to assist it in creation (khalq) which needs volition (irudah). And since they interpret the final cause as mere knowledge and “knowledge” as the “knower,” it becomes totally absurd and contradictory, because we know necessarily that volition (iradah) is not identical with knowledge, or knowledge with the knower.

With these philosophers, says ibn Taimiyyah, heterogeneous expressions may have only one meaning, by knowledge they mean power or volition, by attribution they mean attributed, just as by knowledge they mean the knower, by power they mean the powerful, by volition the volent, and by love the lover. Granted that there is a being without “will” and “choice,” it is impossible for such a being to create this universe, because such a necessary cause needs its own causes and they cannot be independent.⁸⁶

Theories of Harakat al-Falak, Namus, and Mumkin

Ibn Sina and his followers, in trying to compromise between prophecy and philosophy, invented the theory of harakat al-falak or movement of the sky. They maintain that the heaven moves in obedience to the “First Cause” (al-‘Illat al-Ula). To these people the word ilah (deity) means a leader in obedience to whom the sky moves, and their highest philosophy is to remain obedient to leader. The “Maqalat al-Lam,” Book 1, in Aristotle’s *Metaphisca* supplies us with such a description.⁸⁷

The philosophers believed in *namus*. By *namus* they meant government of the world run by wise men for the attainment of good and avoidance of oppression. Those amongst them who acknowledged “prophecy” maintained that all religious were of the type of *namus* brought to the world for the common good. Ibn Sina was one of those who held this view. In accordance with their grades of practical philosophy, those people considered the acts of worship (*‘ibaddah*), revealed laws (*Shari‘ah*), and injunctions (*ahkam*) to be moral, domestic, and civil laws respectively. Ibn Taimiyyah strongly opposes the theories of both *harakat al-falak* and *namus*, and condemns the philosophers for their vain attempt. He pronounces them all to be far from the truth and stigmatizes Aristotle, their first teacher, as the most ignorant of men (*ajhal al-nas*), who knew nothing of God though he was well versed in physics.⁸⁸

As for the theory of *mumkin*, the scholastics are of the opinion that every possible thing (*mumkin*) either occupies space (*mutahayyiz*) or exists in that which occupies space (*qa‘im bi al-mutahayyiz*). Ibn Sina and his followers, al-Shahrastani, al-Razi, etc., in affirming an existing thing different from these, postulate humanity, animality, or such other generic concepts. To Ibn Taimiyyah these generic concepts exist only in the mind. He observed that people objected to such theories when the philosopher wanted to prove a thing which was beyond imagination or which existed by itself imperceptibly. He further disapproved of the theory that all existing things must be visible to the eyes or perceptible to the senses.⁸⁹

How far is Ibn Taimiyyah justified in declaring, against the philosophers, that God is above us in the heaven? Can “direction” be applied to God?

According to Aristotle, upward and downward do not signify place, but the predicament “where,” just as “yesterday” and “today” do signify time, but the predicament “when.”⁹⁰ This does not contradict the dialectics of Ibn Taimiyyah who protests against those who say that God cannot be in any direction, because it signifies a place, and one who is in a place must have been created (*hadith*). In his opinion, those who say that God exists in some direction, meaning thereby that He is in some existing place within the universe, are wrong, but if a “direction” they mean some non-existing thing above the universe (*‘alam*), then they are right, because above the universe there is nothing but God.⁹¹ Then the question arises, what is the Throne of God and why do men raise their hands upwards at the time of prayer?

Ibn Taimiyyah says that this is because, according to the Qur’an, God is on His Throne and the angels bear it.⁹² The early philosophers erroneously believed that the Throne meant the ninth heaven (*al-falak al-tasi‘*), because the astronomers could not discover anything beyond it. They further maintained that this ninth heaven was the cause of the movements of the other eight heavens. The ninth heaven was also called by them spirit (*al-ruh*), soul (*al-nafs*), or the Preserved Table (*al-laah al-mahfuz*) as also active intellect (*al-‘aql al-fa‘al*) and so on. They further compared this ninth heaven in its relation to the other heavens with the intellect in human beings in relation to their bodies and their activities.⁹³ All such theories are, in the opinion of Ibn Taimiyyah, mere conjectures without any foundation.⁹⁴ He quotes a tradition in defence of his belief that the *‘arsh* is above all the

heavens which are above the earth and is in the shape of a dome (qubbah).⁹⁵

Granted that the 'arsh is round and it envelops the whole creation, he further argues, it must be on top of all existing things from all directions, and a man will naturally turn his face upwards when asking for God's favour, and not downwards or in any other direction. If one who looks to any of the heavens in any direction other than upward must be counted as a fool, then what is to be said of a man who seeks God's favour but looks in any direction other than upward when upward is nearer to him than any other direction, right, left, front or back? Supposing a man intended to climb the sky or anything that is upward, he must begin from the direction that is over his head; no sensible person will ever advise him to rend the earth and the go downward because that is also possible for him. Similarly, he will not run to his right or left, front or back and then climb, though that is also equally possible for him to do.⁹⁶

By the time ibn Taimiyyah appeared with his polemics against all sciences and religious institutions whose origin could not be traced to early Islam, pantheism occupied the mind of a number of reputed Muslim scholars. Of these he mentions ibn 'Arabi (d. 638/1240), ibn Sab'in (d. 667/1269), ibn al-Farid (d. 577/1181), al-Hallaj (executed in 309/922), and a few others. Pantheism, according to ibn Taimiyyah, is based upon two wrong principles which are against Islam, Christianity, and Judaism and are contradictory to rational and scriptural arguments.⁹⁷

Some pantheists who profess the doctrines of incarnation (hulul), unification (ittihad), or other closely related doctrine like "Unity of Existence," maintain that "existence" is one, though there are two degrees of it. It is (1) necessary in the Creator and (2) contingent in the creation. To this group of pantheists ibn Taimiyyah assigns ibn 'Arabi, ibn Sab'in, ibn al-Farid, Tilimsani, etc. Of these ibn 'Arabi distinguishes between existence (wujud) and affirmation (thubut) saying that "substances" do exist in non-Being ('adam) independent of God, and that the existence of God is the existence of the substance themselves: the Creator needs the substances in bringing them into existence, while the substances need Him for obtaining their existence which is the very existence of Himself.⁹⁸ Al-Qunawi (d. 673/1274) and his followers made a distinction between "the general" and "the particular" (al-itlaq w-al-ta'yin). They maintained that the necessary One is unconditionally identical with the existing things in general. To ibn Taimiyyah these are fantastic imaginings, because what is general in conception must be definite in individuals.⁹⁹

Ibn Sab'in and his followers hold that "the Necessary" and "the contingent" are like "matter" and "form." Ibn Taimiyyah considers this view absurd and self-contradictory. In his opinion, it leads to the theories of incarnation and unity of existence. These people are the pantheists who failed to conceive of the divine attribute called al-mubayanah li al-makhluqat, different from originated things. They knew that God exists and thought that His Being is the same as His existence, just as a man looks to the ray of the sun and calls it the sun itself.¹⁰⁰ Ibn Taimiyyah quotes a saying of Sheikh Junaid Baghdadi, "To believe in the Unity of God is to

separate the quality of origination from that of eternity,” and emphasizes that there must be a distinction between the Creator and the created; they cannot be one and the same.¹⁰¹

According to ibn ‘Arabi, non-existence is a positive thing even in its state of non-being.¹⁰² He further maintains that the existence of such things is the existence of God Himself; they are distinguished by their essential characteristics which persist in the void, and are united with the existence of God, who knows them. Abu ‘Uthaman al-Shahham,¹⁰³ the teacher of al-Jubai’i, was the first to speak about it in Islam. These people argued in favour of their theory that had there been nothing in the void, there would not have been any difference between (1) things known, and (2) things unknown. Distinction, in their opinion, can exist only between positive things. Such a theory is absurd according to ibn Taimiyyah. The Sunnite Mutakallimun called these people heretics.¹⁰⁴ Ibn ‘Arabi’s theories generally revolve around this point. Regarding the above doctrine of ibn ‘Arabi, ibn Taimiyyah remarks that the Jews, the Christians, the Magians and even the heathens never maintained such a belief. He, therefore, calls it a Pharaonic theory which had also been held by the Qarmatians.¹⁰⁵

According to ibn Taimiyyah, ibn ‘Arabi’s theory reveals two things when analyzed: (1) denial of the existence of God, and (2) denial of His creation of creatures.¹⁰⁶ Besides, according to ibn Taimiyyah, ibn ‘Arabi maintains that sainthood (wilayah) is better than prophethood (nubuwwah) and that sainthood will never come to an end, whereas prophecy has already been terminated.¹⁰⁷

Ibn Taimiyyah then gives various explanations of the pantheistic views of ‘Arabi, and declares them absurd. He compares ibn ‘Arabi to the deaf and dumb, and quotes the verse of the Holy Qur’an, “Deaf, dumb and blind, therefore, they shall not retrace their steps from error.”¹⁰⁸ Similar attacks were made also by him against other Muslim philosophers.

We have seen ibn Taimiyyah’s attitude towards theology, logic, and philosophy. He quotes Imam Shafi’i that theologians should be beaten with shoes and palm branches but while replying to theological as well as philosophical questions, he cannot help adopting theological and philosophical argumentation. From his method of discussion it is evident that in theology and philosophy he is able to put forward an argument by referring everything to the Holy Qur’an and the Sunnah declaring the rest to be innovations.

As for his views about Aristotelian logic, he exhibits his power of argumentation in an extra-ordinary way. He is, no doubt, an independent thinker and is free from the fetters of blind following (taqlid) in every matter. He may be called the precursor of the modern trend of anti-Aristotelianism.

Chapter 44: Sheikh Ahmad Sirhindi

Chapter 42: Jalal al-Din Rumi

A. Life

Jalal al-Din Rumi is the greatest mystical poet of Islam. It can be said without fear of contradiction that in the entire range of mystical literature of the whole world there is none to equal him either in depth or in comprehensiveness and extent. There have been mystics both in the East and in the West whose experiences in the realm of the spirit may have equalled the spiritual perceptions of Rumi, but their emotional or intuitional side was not matched by an equally clear and powerful intellect. Rumi's uniqueness lies in the fact that in him reason is wedded to a wide and deep religious experience. The Muslim world has honoured him with the title of Maulawi'i Ma'nawi (the Doctor of Meaning), a religious scholar who is capable of philosophizing, of penetrating into the meaning of physical and spiritual phenomena, and lifting the veil of appearance to peep into the reality behind them.

When he argues he is a match for a superb dialectician of the stature of a Socrates or a Plato, but ever conscious of the fact that logic is a poor substitute for life. He inherited vast and rationalistic outlook of Hellenism sifting the grain from the chaff, separating the kernel from the husk. As a Muslim he has an heir to the spiritual wealth bequeathed to humanity by the glorious line of great prophets from Abraham to Mohammad. We find in him the sturdy ethics of the Israelite prophets, the dynamic view of life of Islam and the all-pervading love of Jesus. He calls his magnum opus the Mathnawi, the "Shop of Unity," wherein the diversities of life are harmonized and apparent contradictions transcended by creative unities. Nothing that is human or divine is alien to him. He expands with great force and conviction the original thesis of Islam, of the fundamental unity of all spiritual religions despite the contradictory dogmas that narrow theologies have formulated.

The windows of his soul are wide open in all directions. Although a believing and practising Muslim, he is temperamentally a non-conformist for he realizes the secondary nature of the form in comparison with the spirit. He is a Protestant of Protestants, never tiring in the exposition of his thesis that in the realm of the spirit mere authority without personal realization is of no avail. Faith in the sense of believing in the unbelievable and indemonstrable realities is repudiated by him in very strong terms. For him, God is a reality to be experienced and apprehended as more real than the objects of sense-experience; similarly, the relation of man to God is not a matter merely to be rationalized and moulded into a dogma but to be realized in the depth of one's own being where the human gets into tune with the divine and the finite is embraced by the infinite. It is impossible to put any label on a genius like him.

During his life rigid orthodoxy was extremely suspicious of his beliefs and averse to some of his practices which were stigmatized as innovations and aberrations. There was sufficient material in his beliefs and utterances to convict him of heresy before a court of inquisition. His biographers have related an incident in his life which throws light on his catholicity. It is said that the chief of orthodox would expose his heresies. At the very outset,

Rumi was asked to declare as to which of the 72 sects he offered allegiance. Rumi gave a very unexpected answer by saying that he believed in all of them, meaning thereby that there is some truth in every sect which has been exaggerated and distorted by the fanatical exuberance of the blind followers of its tenets. The theologian was non-plussed, not knowing how to tackle a man of such an indefinite attitude. Piqued by this disconcerting reply the theologian, in an angry outburst, said that it signified that he was a heretic and an atheist. The reply to this was still more disturbing for the theologian: Rumi said that he endorsed even this judgment about him.

Let us start with a short biographical sketch of this remarkable religious genius to note his background and the influences that moulded him. He was born in 604/1207 during the reign of Mohammad Khwarizm Shah whose empire extended from the Ural Mountains to the Persian Gulf and from the Euphrates to the Indus. The family had been settled there for several generations. As Balkh was in the Persian domain and Rumi wrote in the Persian language, the modern Iranian scholars claim him as belonging to the Iranian nation. On the other hand, the Turks call him a Turk because after his early youth the family settled in Anatolia which was a Turkish province but was formerly a part of the Roman Empire, and hence the great mystic poet is Arab because at the summit of his genealogical table we find the great Caliph Abu Bakr, the first successor of the Prophet.

The spirit of Rumi, the universal mystic, must be smiling at these attempts of racial appropriation. In one of his lyrics he says that heaven is his original homeland, to which he craves to return. In another lyric he asks his fellow Muslims as to what he should say about himself, "As to my homeland it is not Khurasan, nor any other place in the East or the West, and as to my creed I am neither a Jew, nor a Zoroastrian, not even a Muslim as this term is generally understood."

In his ancestry we find great names, great not only as scholars and divines, but also from the mundane point of view. On the maternal side he is a grandson of the great monarch Mohammad Khwarizm Shah who had given his daughter in marriage to the famous mystic Husain Balkhi, Rumi's grandfather. The father of Rumi, Baha' al-Din was famous for learning and piety. He lectured from morning until evening on religious sciences as well as on mystical lore, and delivered sermons on Mondays and Fridays to crowded audiences. Commoners as well as scholars, aristocrats, and royalty gathered to hear him. The monarch held Imam Fakhr al-Din Razi, the commentator of the Qur'an and one of the great dialecticians, in great esteem and sometimes brought him along to hear Baha' al-Din.

Razi was reputed to be imbued with Greek dialectics, and attempted to prove religious truths by logic. Seeing Razi in the audience Baha' al-Din would pour his wrath on these attempts at the Hellenization of Islam, but the presence of the monarch and the prestige of the preacher prevented him from defending himself. Rumi as a young boy must have heard these denunciations from the lips of his learned father. In the Mathnawi, when Rumi takes up the cudgel on behalf of personal experience against mere logic-chopping, he points to Razi as a representative of a class of people

who want to enter the realm of religious truth, walking on the wooden legs of mere argumentation:

“If dialectics alone could reveal the secrets of the spirit, Razi would have certainly reached them, but the feet of the dialectician are wooden and the wooden feet are most shaky.”

It is said that Razi was so jealous of the popularity and prestige of Baha' al-Din that he poisoned the mind of the monarch against him by insinuating that, if the influence of this preacher were allowed to develop indefinitely, he would wield a power that would surpass the power of the sovereign. Autocratic rulers in Christendom as well as in Muslim kingdoms have often shown fearful jealousy of religious leaders, be they popes or priests. There is no wonder that Khwarizm Shah became apprehensive of the growing influence and prestige of Baha' al-Din and his fears were fanned by the latter's rivals in the religious field. It is quite possible that Baha' al-Din left Balkh along with his whole family to forestall an adverse action against him. But there is also another version about his motive to migrate.

Shortly after he left Balkh the Tarter invasion over-whelmed the domains of Khwarizm Shah. It may be that Baha' al-Din had seen that it was imminent and so he decided to move to a safer region. The family moved first to Nishapur and then to Baghdad where Baha' al-Din stay was prolonged because Baghdad was a cultural centre of the Muslim world and attracted scholars from distant Muslim lands. A delegation from the Sultan of Rum, 'Ala al-Din Kaiqubad, happened to visit Baghdad during this period, its members were greatly impressed by Baha' al-Di's lectures and sermons. On their return to Anatolia they spoke to the Sultan about the spiritual eminence of Baha' al-Din and the Sultan persuaded him to come over to his realm. Baha' al-Din travelled from Baghdad to the Hijaz and passing though Syria he stayed for about a year in the town of Aque and then stopped for seven years in Laranda in Zinjan.

Here, in 662/1263, his illustrious son Rumi, now mature in mind and years, was married. It was here that Rumi's son Sultan Walad was born a year later. The Sultan invited the family to settle down in Quniya, capital of his kingdom. The Sultan with his retinue received him at some distance from the town and reaching the city wall he got down from his horse to escort the great divine on foot. Baha' al-Din's family were lodged in a palatial house and the Sultan would visit him on a regular basis.

We see from this family background that Rumi grew up in an atmosphere of religious learning in which religious problems were discussed and controversies entered into with great enthusiasm. Rumi must have learned much from his father and the great scholars who were devoted to him. The most eminent among them was Burhan al-Din Muhaqqiq whose title denotes that he carried on independent research (tahqia). Rumi's father entrusted the education of his promising son to this teacher who inculcated in his student the habit of independent thinking. Rumi's education continued after the death of his father and we find him at the age of 25 travelling in search of knowledge to great centres of learning like Damascus and Halab (Aleppo).

Rumi lived for some time in the hostel of Helariyyah College. There were eminent teachers on the staff of this College, one of whom was Kamal al-Din ibn 'Adim Halabi, who wrote a history of Halab, a fragment of which has been published in Europe. Rumi's education covered the whole curriculum: the Qur'anic commentary, Hadith, jurisprudence, and Arabic language and literature. His Mathnawi bears ample evidence of this vast learning. It is on account of this intellectual and academic training that his mysticism is not merely emotional. At every step we find him intellectualizing his supra-rational spiritual experiences. He spent seven years in the colleges of Damascus and we find him still engaged in academic pursuits even at the age of 40. The Holy Prophet Mohammad had started his mission at that age. In Plato's Republic Socrates proposed a similarly long process of education for those who would be philosophic rulers of his ideal republic.

Although it is stated in the Manaqib al-'Arifin that at the time of the death of Rumi's father his teacher and tutor Burhan al-Din certified his student's thorough attainment in prevalent sciences and then launched him on a long course of mystical practices which continued for nine years, yet we do not find any fruits of these spiritual experiences in the life of Rumi before his encounter with the mystical and mysterious Shams of Tabriz. Rumi now engaged himself in teaching theology and giving sermons as the learned religious teachers of his time and usually did. His verdict or fatwa was sought and quoted about religious questions on which he was held to be an authority. He avoided music as the rigid puritanical orthodoxy of his time did.

There is no doubt that his meeting with Shams was a turning point in his life. As to what happened when Shams and Rumi met for the first time, there exist a number of legends that are inconsistent. According to one version, Rumi, surrounded by books and students, was engaged in teaching when Shams suddenly dropped in and asked him, "What are these books about?" Taking him to be a man without any learning Rumi replied that the questioner could not know what they contained. At this the heap of books burst into flames. Rumi in great consternation asked him the meaning of this miraculous phenomenon. At this Shams said, "This is what you cannot understand." Another version of this legend is that Shams threw the books in a cistern of water and when Rumi became enraged at this Shams brought them out without the water having touched them, they were as dry as before.

Shibili, the eminent modern writer of a book on Rumi, is evidently right in his judgment that these legends are not based on facts because Sipah Salar, who spent 40 years in intimate contact with Rumi, relates his meeting with Shams in a simple story unadorned by any legend. If anything unusual had happened, surely this friend and devotee would not have missed mentioning it. He says that Shams was the son of 'Ala' al-Din and was a descendant of Kaya Buzurg, an Imam of the Isma'ili sect before dissociating himself from it. Shams received his education in Tabriz and then became a disciple of Baba Kamal al-Din Jumdi, who introduced him to the mystic way of life.

He travelled from place to place living in caravanserais, weaving girdles and selling them for bread. He was staying in a serai of Quniyah when Rumi went to see him. The impression of this mystic on Rumi's mind was deep and lasting. Sipah Salar says that the two were closeted together for six months in Salah al-Din Zarkub's room, which none but Zarkub was allowed to enter. Now Rumi left off teaching and preaching and spent days and nights only in the company of Shams. It was rumoured that a magician had bewitched the great divine.

Rumi's sons and disciples turned against Shams whom they considered to be a charlatan and a sorcerer. Under these circumstances Shams left Quniyah suddenly, leaving no clue as to his whereabouts. After a long time Shams wrote to Rumi from Damascus. This letter kindled the flame in Rumi's mind again. In the meantime his disciples whose resentment had driven away Shams had repented of their conduct. Rumi's son Sultan Walad in his Mathnawi has mentioned this incident in detail because he was deputed by his father to go to Damascus accompanied by some other disciples to persuade Shams to return to Quniyah.

The epistle of Rumi written in verse is recorded in the Mathnawi of Sultan Walad. This letter shows how deeply Rumi had felt the pangs of separation from his spiritual guide and in what great esteem he held him. Shams accompanied this delegation and returned to Quniyah where he was received with great honour by Rumi and his disciples. It appears that Shams now meant to stay on, having allayed the suspicions of Rumi's disciples by marrying a maid of Rumi's house whose name is Kimiya. A residential tent was pitched for the wedded couple in front of the family residence of Rumi. Something happened again which turned Rumi's son 'Ala' al-Din Chalpi against Shams and others joined him with the result that Shams disappeared now for good.

Rumi's reliable biographer, Sipah Salar, says only this much, Shams left Quniyah again in indignation and although Rumi sent people to search for him in various places, no one could find him. But other biographers of Rumi are in full accord about the conviction that Shams was assassinated by some of Rumi's disciples, and the author of Nafahat al-Uns mentions the name of Rumi's son, 'Ala' al-Din, as his murderer. The assassination or disappearance of Shams took place in about 645/1247.

It is difficult to assess the mind and character of a man who appeared from nowhere and disappeared without leaving a trace after having influenced so deeply one of the greatest religious geniuses of all times. Could a man of Rumi's mental calibre be the subject of an abiding delusion created by a master hypnotist? The world has valued Rumi as a man of deep spiritual apprehension, a man whose religious life was rooted in a personal experience which could stand the test of reason. We find him acknowledge his debt to Shams in a thousand soul-stirring lyrics. Shams found Rumi an academic theologian and conventional preacher and converted him into an ecstatic mystic in deep personal contact with the ineffable verities of life. The prosaic Rumi over-night was turned into an ecstatic lyricist, who now found poetry and music much better than philosophy and theology as vehicles for the expression of truth.

Rumi identified himself so completely with Shams that the voluminous collection of mystical lyrics is called Diwan-i Shams-i Tabriz. In hundreds of lyrics the inspiration received from this mysterious spiritual guide is acknowledged with vibrating gratitude. The realm of mystical experience is a doubly sealed mystery to be uninitiated, but he has to accept the testimony of Rumi about it, however personal and subjective it may be, when he says with unshakable conviction that in Zarkub's shop, where the guide and the disciple were closeted together in mysterious intimacy, he found a spiritual treasure of indescribable value and ineffable beauty, both of form and meaning.

We can say only this much, Shams must have been a man of extraordinary psychological power capable of influencing the master mind of his age, whose magnum opus of intellectualized and versified religious experience created a monument of mystical poetry in which eternal love and cosmic reason seem to have achieved perfect accord.

Rumi had no intention of either founding a new sect or initiating a new movement; his devotees and disciples, however, did form a distinctive group after his death, but they developed and perpetuated only some external observances and rituals, and degenerated into a community of whirling dervishes. A felt-cap without a seam - the leaders also wrapping a turban round it and wearing voluminous trousers of many folds - became the standard livery of this group which was incapable of comprehending either the depth of Rumi's thought or the spirit of his religious experience. Rumi was bitterly averse to imitation and blind conformity in religious life became a victim, by irony of accompanied by spontaneously gushing forth lyrics was an involuntary expression of a deeply stirred soul.

The imitators of externals adopted it as a regular practice of inducing religious emotion, unconsciously believing, like William James, that the voluntary adoption of the physical expression of an emotion tends to create the emotion itself. The ecstasy-seeking group sits in a circle, while one of them stands up to dance with one hand on the breast and the other arm spread out. In the dance there is no forward or backward movement but that of whirling around with increasing tempo. When accompanied by music, only flutes and drums are used. This a trying process of under-going a discipline of service to others before a candidate for membership could qualify for it. It starts not with the service of men but the service of animals for 40 days, obviously with the idea that if a man can serve animals dutifully with love and consideration he would serve his fellow beings still better. After this he sweeps the floors of the lodgings of poor devotees. It is followed by other terms of service for 40 days each of drawing water and carrying fuel and other general domestic chores. This is considered to be a cure for man's love of power and privilege and class and caste. At the end he is given a bath to symbolize riddance of lower passions. He takes a vow of total abstinence from all forbidden acts and is allowed to wear the garb of the sect.

B. Beliefs and Philosophy

Rumi as a philosopher of religion stands shoulders above all those Muslim thinkers who are called hukama' in the history of Muslim thought.

He compiled no systematic treatise either on philosophy or theology and made no sustained attempt to build a system of either speculative or mystical metaphysics. One cannot put him in the category of philosophers like al-Farabi, ibn Sina (Avicenna), ibn Rushd (Averroes), and even al-Ghazālī. He did not hitch his wagon to these stars with the exception of al-Ghazālī, who attempted a monumental synthesis of orthodox Muslim theology and mysticism attempting to bridge the gulf between the two. He is the heir to the ethical monotheism of the Israelite prophets which culminated in the dispensation of Islam, but by the time this heritage reached him it had already been supplemented by Hellenistic thought. But he deepens and broadens all that he inherits. He belongs to no school or sect. He picks up what he considers to be true and discards whatever he thinks to be false, however time-honoured and orthodox the view or dogma may be.

A patient study of his Mathnawi reveals him not as a mediocre eclectic but a man with a definite view of the nature of existence. He has a deep-rooted feeling about the basic unity of reality and appearance. For a man like him every thesis and anti-thesis is transcended by a higher synthesis wherein contradictions are resolved in the ever-advancing movement of life. He talks of mere dialecticians with disdain but does not shun dialectics to sustain a thesis. You may consider him a free-lance both in philosophy and religion, but his freedom is informed with a basic attitude that never wavers and perpetually returns to itself after numerous digressions and deviations.

While dealing with a genius like Rumi one is always conscious of a feeling of injustice towards him. The best that he has uttered vibrates with life, while an intellectual analysis in relation to life itself is, in the words of Goethe, like grey autumn leaves as compared with the sapful green tree which has dropped them. But this drawback is inherent in all intellectual analysis and theories and one has to regretfully remain contented with it. We will make an attempt to give a brief summary of his beliefs, outlook and metaphysics under a few headings.

C. The Nature of Existence and Evolution

The ground of all existence is spiritual. It is not easy to define the meaning of the term “spiritual,” especially in the world-view of Rumi. For him, the ground of being is akin to what we feel in ourselves as spirit or ego. Infinite number of egos emerging out of the Cosmic Ego constitutes the totality of existence. In this view even matter is spiritual. The thinker nearest to Rumi in this respect is the German philosopher Leibniz, who centuries after Rumi conceived of existence as infinity of egos at different levels of consciousness. As in the metaphysics of Leibniz, Rumi believed God to be a universal cosmic Monad. There is nothing like lifeless matter; matter is also alive though at a lower gradation of being. “Earth and water, fire and air are alive in the view of God, though they appear to be dead to us.”

In all speculative philosophy, the starting point, the point of departure, is an indemonstrable postulate. So is the case in the thought of Rumi. Assuming existence to be spiritual in the process of creation, he starts with a belief in devolution. There is no satisfactory explanation of why the infinite,

self-existent, self-sufficient Spirit should start dropping egos to the lowest level of sentience and consciousness.

Judaism, Christianity, and Islam have inculcated a belief in creation ex nihilo by a voluntary act of the Creator at a particular moment of time. In Rumi's view there is no creation in time because time itself is created and is a category of phenomenal consciousness which views events in serial time, and mystic consciousness diving into the spiritual ground of being apprehends reality as non-spatial and non-temporal. We see here the Neo-Platonic influence replacing the orthodox Islamic concept of creation in time. Instead of creation in time, we have eternal emergence of egos. Rumi has repeated in many places his view of the eternity of spirits. "I existed when there were neither names nor the things that are named.

We see him moving only one step with Plotinus in conceding that there is emanation instead of creation in time, and then he suddenly parts company with him. Starting with initial unexplainable devolution he becomes a creative evolutionist. All beings have emerged from God by a kind of overflow of the divine spirit, but every being or ego is impelled irresistibly by an urge to return to its origin. This urge which Rumi calls love becomes the evolutionary principle of all existence. Existence, viewed phenomenally, is graded, the egos in one grade being superior or inferior in self realization. The essence of all egos or monads is spiritual which may be called divine because they have all emerged from the self-same divine principle.

The doctrine of the fall of Adam is re-interpreted in Rumi's metaphysics. The original state from which the ego fell was not the traditional paradise of gardens and streams but the unitary ground of divinity. The Fall is concerned not only with man or the disobedience of Adam and Eve, but is a universal cosmic phenomenon. One might say metaphorically that monads in the realm of matter and vegetable and animal kingdoms are all fallen angels striving to return to their original divine ground. The principle that everything has a natural tendency to return to its origin holds good in all spheres and applies to every existent.

Previous to Rumi we find among Greek thinkers guesses about the biological evolution of birds and beasts and man having been gradually differentiated and developed from fish due to environmental changes and the needs of adaptation, but this speculation was never developed any further either by materialistic thinkers like Democritus or idealists and realists like Socrates, Plato, and Aristotle.

We find a doctrine of graded existence and a theory of development in Aristotle's concepts of form and matter and entelechies. Inorganic matter is organized into different species of plants because every plant realizes the idea of its species. Every realized form serves as matter for the embodiment of a still higher entelechy until we reach God who is pure idea or self-thinking though unconcerned with the particularities of phenomenal existence and unrelated to creatures contaminated with matter. Matter for Aristotle is a negative end-concept without a shadow of reality because all reality belongs to ideas and matter as such is bereft of any Idea. Aristotle is not a monadologist like Rumi and Leibniz and for him the human ego also has a transitory phenomenal existence; what is real in it belongs to universal

reason and whatever is personal or individual has no abiding value or reality.

After Aristotle the doctrine of Emanation and Return is found in Platonis. In his view also there is a gradation in existence which is a result of more or less distance from the original ineffable One who is devoid of all qualities like the Nirguna Brahman, can rise again to their original ground by discarding material and biological urges. This leads logically to a negativistic, quietistic, and ascetic view of life of which we find no trace in Rumi because of the Islamic ethics of integration and the eternal value of the individual. For Aristotle, the scheme of graded existence was eternally fixed and there was no idea of the evolution of species. In Plotinus, too, there are more of eternally graded devolutionary states of existence than an eternal urge to develop into higher and higher states which is so clearly depicted in the metaphysics of Rumi. Rumi touches Plotinus and Aristotle only tangentially and then develops a thesis of his own, not found before him in any speculative or religious metaphysics except that of the Ikhwan al-Safa and ibn Miskawaih.

In the whole history of philosophy he is one of the outstanding evolutionary thinkers. He is not a mechanical or biological evolutionist like Darwin and Spencer. Bergson's creative evolution comes nearest to Rumi. For Bergson, too, life is creative and evolutionary; however, he believes this creative evolutionary process to be without any goal. But how could one say that life evolves unless there is an implicit idea of a goal towards which it moves? For Rumi God is the ground as well as the goal of all existence, and life everywhere is a goal seeking activity.

Bergson developed no concept of the self, nor is evolution for him a process of self-realization. Rumi tells us why life is creative and evolutionary and defines for us the nature of the creative urge. It was only in the last decade of his life that Bergson in his book *The Two Sources of Morality and Religion* identified the elan vital with love and moved from philosophy to religion by accepting the prophets and the saints as individuals endowed with intuition and saturated with love which is the creative urge of evolutionary life.

Rumi has presented his view in a language which conforms partially even with the view of materialistic and biological evolutionists. Like them he says that life has evolved from matter, but for him matter was from the outset essentially and potentially spiritual. This removes the insoluble problem of lifeless and goalless matter evolving out of itself a germ of life which even in the lowest and initial is adaptive and goal-seeking.

The Odyssey and voyage of the ego's self-discovery and its gradual unfolding are given in Books Three and Four of the *Mathnawi* with great definiteness. "For several epochs I was flying about in space like atoms of dust without a will, after which I entered the inorganic realm of matter. Crossing over to the vegetable kingdom I lost all memory of my struggle on the material plane. From there, I stepped into the animal kingdom, forgetting all my life as a plant, feeling only an instinctive and unconscious urge towards the growth of plants and flowers, particularly during the springtime as suckling babies feel towards the mother that gave them birth.

Rising in the scale of animality I became a man pulled up by the creative urge of the Creator whom one knows. I continued advancing from realm to realm developing my reason and strengthening the organism. There was ground forever getting above the previous types of reason. Even my present rationality is not a culmination of mental evolution. This too has to be transcended, because it is still contaminated with self-seeking, egoistic biological urges. A thousand other types of reason and consciousness shall emerge during the further course of my ascent; a wonder of wonders!"

The same course is traced in Book Three of the Mathnawi hinting at higher stages until the ego reaches back the divinity from which it had emanated, a state which cannot be grasped by our present rationality nor could imagination visualize it. No category of reason or phenomenal existence applies to this state; it is ultra-existential. We must note here that it is not an impersonal existence which goes on moving from phase to phase but selves or egos from the very start which are perpetually engaged in self-realization. Orthodox Islam, like Christianity, believes in the creation of the universe in time.

The souls are believed to be created with the birth of the individuals though after that they are destined to be immortal remaining eternally either in heaven or hell. But, according to Rumi, the category of time does not apply to the realm of the spirit, so the question of the temporal creation of egos is irrelevant. For Rumi as for al-Ghazālī, time and space are categories of phenomenal consciousness only. He says about serial time, "You think in terms of the past and the future, when you get rid of this mode of consciousness, the problem will be solved."

There is also a hint in the verses that follow that our concept of time is inter-linked with space, an idea which has been mathematically and scientifically developed in modern times by Einstein. Rumi says that in the realm of divine light, which is non-spatial, serial time, divisible into past, present, and future, does not exist. Past and future are relative to the individual self. About space there are numerous verses in the Mathnawi and Rumi repeatedly points to his conviction, which may either be the result of spiritual experience or an epistemological thesis, that in the realm of the spirit the category of space does not hold and has no relevance. The Qur'anic verse *wa la gharbiyyah*, supports this view, and Rumi's intellect and experience must have been strengthened by this scriptural corroboration.

As the human spirit, too, is basically divine, as corroborated by the Qur'an, in which it is said that God breathed His own spirit into Adam, man also, diving into his own real self, can realize the non-spatial nature not only of his own reality but also of all existence viewed as noumena and not as phenomena. He exhorts man to realize this basic fact both about himself and the universe. "You live in space but your reality is non-spatial; space is a phenomenal creation of that which in itself is not space." Rumi develops this thesis still further. He says that space is the basis of division and multiplicity, in which the basic unity of the cosmic spirit is infinitely pulverized and atomized.

Human egos are also basically one. It is only material frames in which the selves at the biological level create the illusion of diversity. Here, too, Rumi gets support from the Qur'anic teaching that there is a fundamental unity in the multiplicity of human egos. "It is He who created you of one spirit."¹

Rumi uses similes to make his meaning clear. He says that sunlight entering houses through many windows is split up the spatial barriers but remains essentially the same. In another place he says that lamps lightening a hall may be many but the light that emanates from them and envelops all of them negates the illusion of separateness. It is a common trait of Rumi that he first uses logical and philosophical arguments and then invariably tries to enlighten the mind of the reader by similes and analogies, but at the end finding the intellect incurably bound by spatial visualization and fettered by the logic of identity and contradiction, refers invariably to ultra-rational spiritual experience which realizes reality as unity and conceives diversity as mere phenomenal appearance.

Talking of a group of divinized souls, he says that they feel themselves as the waves of the self-same sea whose diversity is created by wind. He relates a spiritual experience in which the spirit transcends our spatially inter-linked serial time and enters a dimension of Being wherein the mutually exclusive diversity of psychological processes is negated and a man's causal thinking, with the problem that it creates and attempts to solve, exists no more. As it is a spaceless reality that manifests itself into extended and divisible spaces, creating the illusion of separated things and events, so it is a timeless spirit that creates the categories of serial time with the illusory division of past, present, and future. It is possible for the human spirit to enter this non-dimensional dimension of consciousness and reality. Such an experience does not give one knowledge in the ordinary sense; it is a consciousness of wonder.

D. Love

As we have remarked already, two lines of intellectual and moral and spiritual development running their course independently for more than a millennium had converged in Hellenized Christianity, of which the first unmistakable evidence of the Gospel of John which identified Jesus with Logos. But after this amalgamation the distinctive features of the message of Jesus were not lost and remained recognizably different. Jesus identified God with love, while Hellenism had made reason the ground of reality. Islam, too, was an heir to Israelite prophetic outlook and grappled with the Hellenistic thought incorporating some of its elements and repudiating others which were antagonistic to the fundamentals of its ideology.

Islam attempted a synthesis of reason, love, and law, and an integration of the higher and the lower aspects, not sacrificing the lower and annihilating it altogether but transmuting the lower into the higher. It means surrender to the will of God which is not a passive attitude of submission but a continued volitional effort to attune oneself to eternal realities of which the focus is God. Whatever Islam took over as its heritage, it transformed it in the process of synthesis and assimilation, until the product became qualitatively different. In the opening chapter of the Qur'an we find

God neither as the self-thinking thought of Aristotle nor the top point of the Platonic pyramid of ideas but a conscious and eternally creative will.

The basic attributes of God given in this surah are: (1) Rabb al-'alamin (the Nourisher of all realms and beings), (2) Rahman and Rahim (Creative Love and Forgiving Love), and (3) Malik Yaum al-Din (the Master of the Day of Judgment). We see here that love is prior to law and justice and hence is more basic to the nature of God, who is the Ultimate Reality. The Western critics of Islam are wont to take original Islam as concerned more with unconditional obedience to the revealed will of God than with an attitude of love towards Him. They forget that this obedience is to be rendered to a being who is essentially a lover; as Rahman, He creates out of love, as Rabb He sustains out of love, and as Rahim He forgives out of love.

It is a misrepresentation of Islam to assert that the concept of love is foreign to it and was adopted from Christianity and philosophies of Sufis and mystical and metaphysicians. The fact is that what mystics and thinkers like Rumi did was to elaborate the meaning of love, not only making it basic to religious and ethical life but giving it a cosmic significance as a creative, ameliorative, and evolutionary urge in all creatures and all strata of existence.

It is stated in the Qur'an that God had enjoined love (rahmah) on Himself² and that it encompasses everything.³ In another verse the extent of paradise is given as the extent of the heavens and the earth, which means entire existence. The Prophet was asked by a non-Muslim where hell would be located if paradise covered all existence. He said, "Where is the night when the day dawns?" meaning thereby that when the love of God becomes manifest it shall be revealed as covering the entire existence.

The cosmic significance of love could be derived from the Qur'anic teaching but it required acquaintance with other ideologies to help Muslim thought in its elaboration. So far as theories and speculations are concerned, we can discover distinctively pre-Islamic concepts in Rumi. Here a passage may be quoted from Khalifah Abdul Hakim's book, *The Metaphysics of Rumi*, "So far as the theories of love are concerned a part of his arguments and views can be directly traced back to Plato who has had a decisive influence on all mysticism, both Islamic and Christian, by his conception of a super-sensuous Reality, as well as Eros (love) as a cosmical power. Rumi's Love as an experience was not a product of any theory, as something intimately personal; it cannot be a subject of criticism.

But the conceptual apparatus that he employs to philosophize about love requires to be understood in its historical connections. The contents of (Plato's two Dialogues) *Phaedrus* and *Symposium*...were not unknown to the thinkers of Islam. Ibn Sina's *Fragment on Love*⁴ is mostly a reproduction of the dialogue (Plato's) *Symposium*...Love as the movement towards beauty which being identical with Goodness and Truth represents Perfection and the Highest Idea, and Love, as the inherent desire of the individual for immortality;...given by Avicenna is a simple repetition of the Platonic theory of Love. The processes of Assimilation, Growth, (and) Reproduction are so many manifestations of Love. All things are moving

towards Eternal beauty and the worth of a thing is proportionate to its realization (or assimilation) of the beauty.”⁵

Newton explained the movement of heavenly bodies by physical gravitational pull and Kant promulgated the nebular hypothesis to explain the origin of heavenly bodies out of incandescent vapour. Hegel explained the ever-progressing dynamism of Nature and Mind as the dialectical unfolding in time of the Eternal Absolute. Darwin presented a biological view of the creation of higher species by the blind urges of the struggle for existence and life’s adaptation with the environment. Rumi’s evolutionary concept comprehends all these partial and fragmentary theories, taking them up in a grand synthesis.

Similarly, Rumi has an intuition of the gravitational pull of atoms and masses of matter but, instead of explaining it by mechanical dynamics; he resorts to love as the fundamental urge which creates attraction and affinities. “All atoms in the cosmos are attracted to one another like lovers; everyone is drawn towards its mate by the magnetic pull of love. Heavenly bodies draw the earth towards them in a welcoming embrace. It is on account of this cosmic pull of that earth remains suspended in space like a lamp, the forces from all directions pulling it by equilibrated attraction not allowing it to fly away or drop down in space, as if the stellar dome of heaven were a magnetic dome inside which a piece of iron is suspended without visible cord”

According to Rumi, the same force that creates heavenly bodies out of nebulae resulting in stars and planets and systems, proceeds further and generates life because love by its essence is creative. As atoms by their affinities conglomerate in the molecules so in a further evolutionary urge they emerge as life cells which first appear in vegetation and then advance towards animality. Hegel said that creation proceeds through a synthesis of the opposites, but Rumi says that these apparent opposites were already akin by the affinity of love. Love originates in God and moves towards God who is essentially a creator; therefore, love as it advances from phase to phase in the upward movement of creation brings into being new forms of existence at every step.

We have already stated that Rumi is a monadologist and when he talks of atoms and their mutual attractions he is really taking of egos that in the process of realizing their divinely-rotted self-consciousness. It is this urge for self-realization that makes the egos act as they do. As their source is God, so their goal is also God, and the process of moving towards this goal creates new perfections at every stage. Everywhere there is life and life is essentially a goal-seeking activity. The lower merges into the higher; it is not a process of progressive annihilation but assimilation.

Rumi says that the heavenly movements are not blindly mechanical but are waves in an infinite ocean of love. If cosmic love were not there, all existence would get frozen and shrink into nothingness. The inorganic would refuse to merge and emerge into vegetation would not be lifted up into animal life nor would life ascend towards the mind and spirit. The egos like infinite swarms of locusts are flying towards the harvest of life. Without love, nothing would move.

The religion of a mystic philosopher like Rumi is a universal religion which could be enclosed within any orthodox or dogmatic boundaries. His religion is not the creed of any one particular religious community but being the religion of the universe is a universal religion. It is the religion of glowing stars, of flowing streams and of growing trees. Whose belief, intuition, and practice accord with his outlook, he has attained the truth. Religion, if it is genuine is not a blind faith about the understandable unknown; it is an ever-present reality perceived and lived. It is the alchemy of life which though the magic of love transforms the lower into the higher.

We see ourselves that bread is transubstantiated into life and mind. Could any narrow scientific intellect explain this miraculous transmutation? In the Aristotelian logic of identity everything remains what it is, and in mechanistic materialism there is no way of explaining the goal-seeking tendency of life from non-purposive aimless atoms. Life has an infinite assimilative power; there is nothing that could remain eternally foreign to it. As fire burns even a dross and converts it into a pure flame, so every happening in life is capable of being converted into light and life.

The universe, according to Rumi, is a realm of love. In comparison with love, law and reason are secondary phenomena. It is love that creates to fulfil itself and reason steps in later to look at it retrospectively, discovering laws and uniformities to seek the threads of unity in the diversities of manifested life. Language was not created by any pre-conceived grammar, nor do the flowers blossom by any conscious planning or according to the laws of botany or aesthetics. Rational thinking follows creation but does not precede it. Rationalization, being a secondary phenomenon, is not by itself a creative force.

As Hegel has said, philosophy always comes too late only to contemplate retrospectively what the dynamism of history has already created and completed. Cosmic love transcends all creeds and all philosophies and so the religion of love could never be completely identified with any orthodoxy, dogmatism, or speculative theory. Rumi says that there is no contradiction between universal love and universal reason, but when the human intellect narrows itself, it begins to take a part for a whole, making the mistake of identifying a fragmentary phenomenon with the whole of reality.

Human intellect, divorced from universal reason, remains at the biological and utilitarian level, and language which is the outward garb of the intellect possesses no vocabulary for the description of the intuition of cosmic love. Human consciousness remains generally at the biological level and its perceptions, affections, and conations are governed directly or indirectly by biological needs. This biological instrument Rumi calls *khirad* or particular reason (*'aql-i juzwi*) to distinguish it from universal reason, which exultingly calls itself scientific reason, capable of explaining all reality and solving the riddle of the universe, proves to be utterly useless when faced with the intuition of life and love, and, instead of gracefully accepting its inadequacy, begins foolishly to deny the reality that it cannot comprehend.

The deep impress of Rumi which has continued to develop through the centuries in modern times produced a disciple of the intellectual calibre and poetic genius of Iqbal. The reasons for this influence may be briefly summed up as follows. Here was a man who, like the great prophets and saints, did not accept religious faith at second hand; for him it was a personal experience more convincing than either logical argument or sense-perception. But religious experience, if it rests in its subjectivity, cannot be communicated; it cannot induce conviction in others who do not have it.

Rumi deplores the inadequacy of human speech to convey it and also points to the limitations of sense-experience as well as inductive or deductive reasoning of what he calls the particular intellect which deals with reality piecemeal. But side by side with his ultra-sensuous and ultra-rational mystic experience of the all-enveloping spirit in which every ego lives and moves and has its being, he presents himself to us as an acute logician and a skilled metaphysician. When you add his lyrical fervour and poetic genius to his remarkable capacities, he begins to tower above all those who are either mere mystics or mere philosophers or mere poets.

One finds in him anticipations of Kant who tried to prove phenomenality or subjectivity of time, space, and causality; anticipations of Bergson in his criticism of the intellect and in his conception of elan vital creative evolution, and anticipations of Nietzsche in his conviction that present humanity must be superseded in a further advance towards new dimensions of being. He is an idealist and spiritualist of the highest order. He is fundamentally an evolutionary thinker who conceived of existence not in static but dynamic terms.

The unconscious urge to rise to higher levels is implicit in all existence; the inorganic is always ready for being assimilated by the organic. In every entity there is an upward urge from within and a pull from above. The inertia of matter on which Newton based his physics and astronomy is declared to be an illusion, the reality of which is infinite motion or restlessness of what Democritus and the 13th/19th century physicists call atoms but Rumi calls egos. Rumi re-establishes the reality of the world and the dignity of all life, particularly of human life which has become self-conscious and conscious of its divine origin and goal. All movement is from God unto God.

Rumi performs the admirable task of ridding mysticism of quietism and irrationalism. He establishes with all the force of his genius the reality of free-will which is vouchsafed to man to identify it freely with the cosmic will. He has brought out the essence of universal religion as creative love. He preaches the infinite potentialities of life because all egos have their origin in the Infinite Self and are restless and nostalgic in order to realize their infinity. Many creeds and philosophers had declared life to be an illusion, but Rumi declares life at all grades to be Eternal Reality; it is not life but death which is an illusion. The purpose of life is more life, higher and better.

Nietzsche criticizes bitterly all creeds that say "No" to life and says that there are only two kinds of creeds: those that say "Yes" to life and those that say "No" to it. Rumi's is a life embracing creed. Although one of the

greatest mystics of all time, he was not a body-torturing and self-annihilating mystic. In a verse he talks of great souls as great hunters of life trying to capture and assimilate the spirituality of angels, saints, and prophets, finally aiming at capturing the cosmic spirit itself for perpetual and eternal enrichment of the self, actualizing its infinite potentialities. He wants you not to gather your garments to prevent them from getting wet but to plunge a life's challenge, is the way of life that he preaches and practises. Only for a sleeping soul life is an empty dream; creeds of illusion are the products of lovers of sleep and worshippers of the night.

About the infinity of life and its restlessness he says, "Human egos have experienced the shaping of universe after universe, could you say which of them mirrors the essence of yourself? Is it not that the seven heavens are below the empyrean but our flight is beyond the empyrean? Neither the heavens nor the empyrean could be our goal; we have to fly towards the rose-garden of union with the divine."

For Rumi life is an alchemy perpetually engaged in transformation and transubstantiation. You see before your eyes earth, water, light, and air being transformed into plant life, plant life turning into animal life by assimilation, and animal life, ascending to mind; why couldn't mind be transformed into a divinized spirit? "They say, copper turns into gold by alchemy, but the copper of our life converts itself not only into gold but becomes an alchemy itself with the quality of spiritualizing whatever it touches."

The space at our disposal compels us to finish this brief survey of Rumi's outlook on life with two of his lyrics: in one he gives the characteristics of the "Man of God" and in the other depicts a mystic's search for God through the emblems of various creeds, ending in finding God within himself. "The 'Man of God' is intoxicated without wine and full without meat; he is struck with wonder and cares not about food and sleep. He is a king in a dervish's cloak; he is a treasure found in a ruin. The constituents of a man of God are not the four elements - earth, air, water, and fire. He is a boundless ocean of the spirit containing countless pearls.

The heaven within him contains numerous suns and moons. He gains the truth by knowledge is beyond right and wrong. The heaven within him contains numerous suns and moons. He gains the truth by knowledge from God and from books. He stands above creeds and heresies, and he is beyond right and wrong. He has ridden away from Non-Being in glory and majesty. He is hidden, Oh Candle of Faith! Such a 'Man of God' do you seek and find."

Rumi is talking here of the ideal man or the ideal of humanity. He is hidden in the nature of every man. The purpose of life is to reach this perfection. In another verse he has repeated the story of Diogenes moving about in the market-place of Athens with a lamp in his hand in broad daylight seeking Man in a crowd of men who, according to him, were only counterfeiting humanity. When he is told that no such being could be found, he replies, "I am craving to find him who is not found."

Religion has been aptly defined by Hoffding as Faith in the conservation of values. According to Rumi's mystical metaphysics, the spirit is the origin

and locus of all intrinsic and abiding values. The Real which is manifested in the human spirit is eternal and immortal. He exhorts human beings not to lament the transitoriness of phenomenal life because that which is real can never perish. The streams of phenomenal life continue to flow and pass away, lament not their vanishing because inexhaustible eternal source remains undiminished and shall continue to issue in many more streams.

We must note that here we have no blank qualities, no transcendent infinity of a static Absolute, but a perpetually gushing fountain of eternal life, from which all egos quaff as much as they can. Mortality belongs to appearances alone, not life but death is an illusion. Every ego is destined to be immortal by participation in life eternal. The purpose of life is self-perpetuation and self-enrichment not only through the reproduction of the species but by the upward and forward urge of every ego. Life moves by a series of negations and assertions, self-realization cannot proceed without self-abnegation.

Every stage reached by an ego has to be negated and transcended so that “on their dead selves’ stepping stones men may rise to higher things.” Rumi says that from the very outset life has placed a ladder before you so that you may rise step by step. After this he reiterates his fundamental hypothesis that life has advanced from the inorganic to the organic, traversing the vegetable and the animal kingdom, reaching the stage of reason, knowledge and faith, until man, with his body which was only a part of the earth, evolves a mind and spirit and becomes a whole. But even after having become conscious of infinity, the voyage of discovery through the infinite continues. For a long time it was a journey towards God, but now it will be a journey in God’s infinity, from earth to heaven, from humanity to angelhood until the finite embraces the Infinite: man the Son of God becomes one with the Father. It is the bodies that become old and decrepit, life remains eternally youthful.

The Qur’an says about the creation of man’s body was made of clay, but the material frame having been perfected, God breathed from His own spirit into him. Rumi in his discourses collected in *Fihi ma fihi* has quoted a tradition of the Prophet wherein it is said that Adam’s clay was kneaded in 40 days. The Qur’an says that God’s day is an epoch of a hundred thousand years. This mode of expression is not meant to convey an exact mathematical figure but is an idiomatic or rhetorical expression for an immensely long period. Accordingly, God’s 40 days might mean hundreds of millions of years.

Rumi concludes from this that man’s bodily organism too did not come into existence by the creative fiat of God in a moment but is a product of a long process of evolution. It was after the perfecting of the physical organism that the spirit of the Lord became manifest in man awakening the eternal essence of the human ego. With the emergence of this consciousness the human ego realizes that it is not a product of this evolution but, in its essence, is prior to the phenomenal course of the universe. After this realization, the universe with its diversity of objects is viewed not as a cause but as an effect, because the ego pours existence into its own moulds with the categories of time, space and causation.

Rumi says that the body is not the cause of the mind but is created by the mind as its instrument for working on the material or phenomenal plane. What we consider to be the qualities of an independently existing matter exist only in relation to a perceiving mind. In a lyric, Rumi describes his search for God after having realized the nature of his own ego. He moves from creed to creed and dogma to dogma. Not finding Him in temples, institutions, and symbols, he returns unto himself and discovers Him there in the sanctuary of his own heart. He is not satisfied with any creed until God is directly experienced by him. Here is one of the finest mystical lyrics of Rumi:

“I existed at a time when there were neither the names nor the objects of which they were the names; the names and the objects named came into existence in relation to us at a time when egos were not yet individualized and there was not yet any question of ‘I’ and ‘We.’ I searched for God among the Christians and on the Cross but therein found Him not. I went into the ancient temples of idolatry, no trace of Him was there. I entered the mountain cave of Hira (where Arch-angel Gabriel appeared to the Prophet) and then went as far as Qandhar but God found I not, neither in low nor in high places. With a set purpose I fared to the summit of Mount Caucasus and found there only ‘anqa’s habitation. Then I directed my search to the Ka‘bah, the resort of old and young, God was not there even. Turning to philosophy I inquired about Him from ibn Sina but found Him not within his range. I fared then to the scene of the Prophet’s experience of a great divine manifestation only a ‘two bow-lengths’ distance from him’ but God was not there even in that exalted court. Finally, I looked into my heart and there I saw Him, He was nowhere else.”

This is the experience and language of the great mystics of all spiritual religions who were not satisfied with institutional religion, and who based their spiritual life on personal experiences and convictions not derived from theologies and philosophies. These experiences are the common heritage of all great souls and the common ground on which great religions meet, disregarding intellectual formulation of dogmas and diversities of modes of worship which have made religion a dividing instead of a unitive and harmonizing force.

Rumi is one of those rare saints and mystics whose intellectual fibre and creative moral and social effort is not weakened by subjective emotional experiences unrelated to the realities of everyday life. In him spirituality, rationality, and universal morality have found a healthy synthesis. God, universe, and humanity are embraced in a single all-encompassing vision, the vision of creative love. Tennyson ends his “In Memoriam” with a stanza which sums up Rumi’s vision and creed:

“That God, which ever lives and loves,
One God, one law, one element,
And one far off divine event,
To which the whole creation moves.”

His appeal to the philosophers of religion, epistemologists, and metaphysicians is as great as his appeal to the mystics of all religions. Neither modern philosophy nor modern science has left him behind. For

about a century now the entire philosophical and scientific though has been dominated by the concept of evolution, and it is the evolutionary concept that has been mainly responsible for sabotaging ancient theologies and views of creation, resulting in almost universal scepticism and agnosticism. Theology everywhere has been making an attempt to save the abiding realities and values of religion by accepting universal evolution as an indubitable fact and recasting old beliefs and dogmas. Rumi performed this task six centuries ago in a manner that can offer guidance to all who want to reconcile religion with philosophy and science.

Chapter 43: Mahmud Shabistari, Al-Jili, and Jami

A. Mahmud Shabistari

Mahmud Shabistari, so called after the name of Shabistar, a village near Tabiz in Adharbaijan, was born about the middle of the seventh/13th century and died about 720/1320. Little is known of his life. His *Gulshan-i Raz* (The Garden of Mystery) is a poetical exposition of the doctrine of the Unity of Being. It was written in 710/1311 in response to certain questions about mystical philosophy asked by one Amir Husaini from Khurasan.

The exposition of the doctrine of the Unity of Being in the book adds nothing to what had earlier been said by ibn 'Arabi. Mahmud, however, is much clearer and much more precise than his spiritual teacher. Being, by its very definition, he says, is existent, and non-Being, non-existent. There is nothing in existence except the one. The contingent and necessary were never separate; they existed from eternity as one. If you look at one side of One, it is one, and if you see the other side, it becomes many - the only difference being that the aspect of unity is real, while that of plurality is illusory. Reality is one but its names are many, and it is this plurality which becomes the cause of multiplicity.¹

Essence as such is beyond our knowledge or comprehension. But according to Shabistari, this inability on our part to know God's essence arises because of His nearness to us. Essence as absolute light is as invisible to the eye as non-Being which is absolute darkness. Nobody can look at the sun directly. But it can be seen as reflected in water. Relative non-being is like water. It serves as a mirror of the Absolute Light in which is reflected the illumination of Haqq (truth). This relative non-being is the latent reality ('ain al-thabitah) of ibn 'Arabi's system, which reflects the divine light in accordance with its natural propensities. The divine light as pure light was a hidden treasure, but when it was reflected in the mirror, the treasure became manifest. But, in this process, the essence that was One became many.²

Shabistari then describes the process of descent of the one after the manner of ibn 'Arabi. The first manifestation of the essence is the universal reason ('aql al-kulli), the stage of unity (ahadiyyah); the second is the universal soul (nafs al-kulli). Then comes the Throne ('arsh), the heavenly Chair (kursi), seven heavenly spheres, and four elements, the three kingdoms of minerals, vegetables, and animals. The last in the series is man who is the acme of creation. Though temporally last in the series, man is logically first, as tree is potentially prior to the seed. The entire world was created for him while he was created for himself, as the embodiment of God's highest manifestation. But he possesses certain baser elements which, however, are essential for his moral progress. A mirror, to be able to reflect things, must have one side totally blackened. If it were a crystal, it would cease to serve as a mirror.

As man is the final cause of creation, everything is made to obey his command. All things are manifestations of the different names of God, but, being the reflection of the Named, man comprises within himself all the names; therefore, all the creation is within him. He is the most marvellous creation of the Lord and owes everything to Him, his power, knowledge, and will are all God's.

Reason is perfectly useless, according to Shabistari. It's a long, winding, and arduous path. A philosopher is like a cross-eyed man who sees duality everywhere. He starts with the objects of the world conceived as real. On this basis he argues the existence of the Necessary, as distinct from and other than the contingent. Arguing on the basis of a continuous series of causes and effects, Shabistari asserts that the Necessary Being is the Primal Cause of the process of creation. The whole process of reasoning, according to him, is wrong. There is no possibility of the knowledge of God through the category of contingency as the latter does not possess any similarity to the former. "It amounts to discovering the burning sun with the help of the dim light of a tiny candle."

The best method, therefore, is to give up logical reason and enter the valley of gnosis.³ Knowledge gained through discursive reason leads one to sleep, while gnosis awakens one from slumber. Like Abraham, one must go beyond the divinity of the stars, the sun, and the moon which, according to him, represent sense-perception, imagination, and reason, respectively.⁴

In the sixth question of *Gulshan-i Raz* the Sheikh explicitly rejects the usefulness of reason in the mystic search for truth. He holds that there is "a way" beyond reason by which man is able to know the secret of reality. This intuitive power of man is hidden within him as fire is implicit in the stone. When this fire blazes forth, the entire world becomes bright and illumined.

Discussing the value of knowledge in the tenth question he says that by knowledge he does not mean the device by which people gain worldly power and prestige, for that is contrary to the spirit of a true mystic. Knowledge is useful only when it leads one to the right action, action that springs from the heart. Shabistari also suggests a study of both the sources of knowledge mentioned in the Qur'an - the external world (*afaq*) and the internal world of self-consciousness (*anfus*). But in practice the mystics' study of the internal world has always led them to emphasize the illusory character of the external world.

The account of moral qualities given by Shabistari is a mere reproduction of Platonic and Aristotelian theories. Wisdom (*hikmah*), moral purity (*'iflah*), bravery (*shaja'ah*), and justice (*'adalah*) are the main moral qualities. He discusses briefly the Aristotelian principle of the mean. Paradise is the result of following this middle path, while adopting either of the extremes would lead to hell. When moral purification is attained, man is vouchsafed divine light (*tajalli*) which illumines his soul and raises him to the highest level. Saints and prophets are the persons who fall in the category of the illumined souls.

This manifestation (*tajalli*) of God is not only in things that are good but also in things which in common usage, we call evil. As God is the only being and the only cause of everything, so all things without distinction manifest His light. The logical position of pantheism is that good and evil are all alike and, as manifestations of God, stand on an equal footing. But when we come to the ordinary common-sense view, we distinguish between them and attribute good to God and evil to Satan.⁵

Like all other pantheists, Shabistari is completely deterministic. He holds that the so-called sense of freedom possessed by man is due to his

consciousness of selfhood as an entity distinct from God. Man is by nature non-existent and, therefore, it is meaningless to attribute freedom to him. Believers in freedom of choice are Zoroastrians who make a distinction between the god of good and the god of evil. to attribute power, will, and action to man is wrong and in this matter, according to him, both the Mu'tazilites and the Ash'arites have gone astray - the former in saying that man is free in his choice and the latter in making man responsible for his deeds due to the power of "acquisition" attributed to him.

According to Shabistari, man is not created for exercising moral responsibility, but for some other purpose. He does not explain what that other purpose is. His commentator, Lahiji, however, adds that it is to serve as a polished mirror for manifestation of God's essence, attributes and names. Can we ascribe any freedom to the mirror in reflecting objects? For every one of us, actions were pre-determined. God's actions are inscrutable. "Can you explain," he asks, "why one man is born Mohammad and another Abu Jahl?" Man's dignity lies in being under compulsion and not in having a share in free-will.

But, then, why is man held responsible for his deeds? Is it not injustice? The Sheikh thinks that it is not injustice but an argument in favour of God's absolute power and arbitrariness. Again, the object of making man responsible for deeds over which he has no control is to compel him to renounce this world forever, as he is elementally incapable of fulfilling the obligation of following the right path and obeying God's Law, i.e. Shari'ah.⁶

What are the steps by which an individual reaches the stage of perfection? He is born, according to him, as the acme of creation, the purest of the pure, and the highest of the high. But due to illumination which he receives through his intuitive powers or his rational capacity man realizes his weakness and then sets on a journey backward. It is travelling from contingency to necessity from plurality to unity, from evil to good.

There are three stages in this journey. The first is called absorption. Here, the light of God shines through his actions so that the mystic regards the actions of everything as illusory. Nothing besides God possesses any causal power. At the second stage the divine light shines through God's attributes and so the Sufi regards the attributes of everything else as merged in God. The last stage comes when the mystic receives illumination from the very essence and sees the real state of affairs. For him nothing is existent except He and the being of all things is derived solely from Him. When he reaches this stage, he becomes perfect and attains a state of union with his Lord "so much so that neither angels nor prophets can equal him. The whole circle of existence is covered and man reaches the point from where he started."⁷

The religious Law (Shari'ah), the mystic Path (Tariqah), and Truth (Haqiqah) - all go to form the perfect man. Shari'ah, according to the Sheikh, is like the protecting shell of the almond. It is useful to a certain stage. When the stage of perfection is reached, the shell becomes useless and is better thrown away. Nevertheless, a perfect Sufi needs religion - not for himself but for others.

Shabistari follows the general trend of mystic writers in describing the nature of saint ship (wilayah) and prophethood (nubuwaah). Saint ship is a

more general category than prophethood. Saints so called and prophets are all saints in the first instance. In a mystic saint ship is hidden, while in a prophet it is manifest. A saint is a follower of the prophet in Law and in this he attains the highest position and becomes equal to the prophet in realizing union with the Lord. With the death of the Holy Prophet the first cycle of saint ship, a cycle in which prophethood and saint ship were both manifest in the world, came to an end.

After the Final Prophet, saint ship continued and the new cycle began to take its shape. One day the seal of saints will appear, who shall be the acme of saint ship and, with his appearance, the cycle of the two worlds will come to an end. He will be the whole, of which all the previous saints were parts. Like the “Seal of the Prophets,” he shall be a blessing to the whole world. He will succeed in bringing peace and security to man; justice and equity will reign.⁸ The word “seal,” according to ibn ‘Arabi, does not signify a mystic with who saint ship will come to an end, but with Shabistari, the seal of saints, like the “Seal of Prophets,” would terminate saint ship forever. The last of the saints is the “seal” with which the world will come to an end.

This world of matter, however, being the locus of God’s manifestation (tajalli) cannot come to an end at all. There shall be no time when the manifestation of Haqq can be said to have ceased. The present world and the world to come will meet and there is no dividing line between the two. The next world is something ever in the making. What we usually call this world and the next are mere names for what Shabistari, following ibn ‘Arabi, calls the ever-new process of creation, an unending cycle of annihilation and recreation.

The life to come, man would be without body but it would be something subtle and transparent. Our deeds and mental dispositions of the present life would take concrete shape and become materialized in some tangible form. Good disposition will take the shape of light (paradise) and bad the shape of fire (hell).⁹

After the death, the individuality of man shall vanish at last and many shall be dissolved into One.¹⁰ Man shall be vouchsafed the beatific vision, but it will not be something external, it will be a manifestation within him.¹¹

B. Al-Jili

‘Abd al-Karim b. Ibrahim al-Jili was born in 767/1365 and died at about 832/1428. Except for the few references in his book, almost nothing is known about his life. He was the disciple of Sheikh Sharaf al-Din al-Jabarti and lived in Zabid (Yemen). He also visited India during his travels. He claims that he received mystic illumination which led him to write his well-known book, *al-Insan al-Kamil fi Ma‘rifat al-Awakhir w-al-Awa’il*. Its object is to expound and express the truth.

He holds that Absolute being is one and that all multiplicity is illusory. “Absolute Being is the essence (‘ain) of what we call the phenomenal world (khalq) and God (Haqq). The Absolute Being manifests itself in two different realities, khalq and Haqq.”¹²

Essence, Attributes, and Names

Absolute Essence is that to which names and attributes are ascribed. It is a Self (nafs) which exists by itself. It deserves every name which Its perfection demands. No description in words can fully convey Its essence. A thing can be understood by another thing which is related to it positively or negatively, but there is nothing in the universe which is so related to the Absolute. It is Pure Being which is equal to non-Being - a sum of contradictions. "It is two contradictories gathered in a unity and this sum of contradictions is not impossible."¹³ It has two attributes: eternity and everlastingness, two qualities: God (Haqq) and the world (khalq), two descriptions eternity (qidam) and createdness (huduth), two names: Rabb and 'abd (Lord and slave).

It has two faces: outward (visible), i.e. the present world and inward (invisible), i.e. the world to come. It has two predicates: necessity and possibility, two points of view: according to the first, It is non-existent for Itself and existent for others, while, according to the first, It is non-existent for Itself and existent for others, while, according to the second, It is existent for Itself and non-existent for others. Two modes (ma'rafah): according to one, It is positive (wujub) in one plane and negative in the other, while, according to the other, the position is reversed. With regard to Its Self (nafs), It is simple, with regard to Its form, It is compound, with regard to Its essence, It is unique, with regard to Its emanation, It is light, and with regard to its indivisibility, It is darkness, and still It is beyond what we have said about It."¹⁴

It is clear that according to al-Jili reality is one¹⁵ and belongs to divine Substance (jauhar) which has two different aspects: God and the world. Multiplicity is only subjective and relative. "You can say what you like. You are at liberty to say the circle [of reality] is God and its inside is the world or that the circle is the world and its inside is God. It is God as well as the world."¹⁶ "You should know that knowledge of that lofty essence is that you should realize through mystic experience that you are He and He is you. This is neither union (ittihad) nor incarnation (hulul), for the slave is slave and the Lord is Lord: the slave does not become Lord, or the Lord a slave."¹⁷

A true mystic or the perfect man is able to realize in his super-sensuous experience that multiplicity is only a subjective way of look at things; otherwise reality that underlies it is one.¹⁸ What we call the world is nothing but the manifestation of God. In another place, he says, "Just as God was present in eternity in the Dark Mist ('Ama') which is also called Reality or realities, Hidden Treasures and White (Pure) Chrysolite, so is He present now in all the things of the phenomenal world without incarnation (hulul) and mixture (imtizaj). He is manifested in the parts and atoms of the phenomenal world without becoming many."¹⁹

Like ibn 'Arabi, he deals with the problem of transcendence and immanence as differentiating attributes of the essence which correspond to the twin characteristics of God and the world. Immanence (tashbih) is the form of divine beauty which is manifested in all things to the phenomenal world without any distinction.²⁰ The Christians are right when they say that Jesus, Mary, and the Holy Ghost are all manifestations of God, but they are

wrong when they limit this manifestation to three persons only. As a matter of fact, God is immanent in the whole world.²¹ Any belief about reality that ignores any of these two characteristics, transcendence and immanence, is defective and wrong as is the case with Christianity for instance.

Transcendence (tanzih), when applied to God, implies that, in spite of His manifestation in all things, He is above and beyond all of them. But this sort of transcendence, according to al-Jili, is related to immanence and, therefore, does not fully represent the true essence which is characterized by what he calls essential which none claim to understand. He is, therefore, above even the transcendence which is asserted of Him in correlation with His Immanence.²²

Name (ism) is that which specifies the named in the understanding, pictures it in the mind, brings it in imagination, arranges it in thought, preserves it in memory, and presents to the intellect. A man who does not know the named gets its knowledge through the name. The name and the named are related to each other as outside to inside (zahir to batin) but in fact both are identical. There are some names the named of which do not exist in actual reality, as, for instance, 'anqa' which exists only in name. 'Anqa' and Allah stand at opposite poles, while the object of 'anqa' is non-Being, the object of Allah is Absolute Being. We can reach knowledge of God through divine names and attributes or through the name of Allah which comprises in itself all names and attributes. Names are of two kinds: (1) of the essence, e.g. one (ahad), single (wahid), unique (fard), etc., and (2) of the attributes, e.g. knowledge, power, mercy, etc.²³

An attribute of a thing is that which leads one to the knowledge of its state. This distinction between attributes and essence is operative only in the sphere of the phenomenal world. "Everything in the phenomenal world which is qualified by an attribute demands that the attribute should be other than the thing, because it is subject to division and multiplicity. At the same time it demands that the attribute should be identical with it. We say that man is a rational man. It means that animality is a separate entity and so is rationality a thing different from man. But it also means that rationality and animality are both identical with man, because he is composed of both and is nothing beyond them. With regard to division, the attributes of a creature are different from its essence, while with regard to arrangement (tarkib) they are identical with it. But in God, this otherness disappears, for division and multiplicity does not apply to Him. His attributes are his essence and the two are identical."²⁴

Thus, according to al-Jili, the material world is not a non-reality, a maya, but a reality which expresses the outward form of the Real. Plurality and division in the external world are the manifestations of the divine essence as attributes which are in the last analysis identical with it. If we do not accept this view of identity, the universe would not, according to him, lead to the essence.

In the 57th chapter of Insan-i Kamil, al-Jili says explicitly that thought or idea is the material of the universe. "Thought is the life of the spirit of the universe...Existence is nothing but a thought. Thought is the origin and the source of being (wujud) and is the essence in which God is completely

manifested. Do you not see your belief about God as having names and attributes which pertain to Him? Where is the locus of the belief (i.e. the universe) in which God has manifested Himself for you? It is nothing but thought.”²⁵ Later on, he asserts that Being (wujud), as a matter of fact, is nothing but “a thought within a thought within a thought.”²⁶ Thus by identifying attributes and essence, he is able to give reality to the physical world of nature which to the mystic becomes a source of the direct knowledge of God.

Among the important divine attributes he mentions divinity (ilahiyyah), mercifulness (rahmaniyyah), and lordship (rububiyyah). Divinity is the sum of all the realities (i.e. all individualities) of Being and their maintenance in their respective positions (maratib) within the whole. It is the rank of God as Necessary Being. “You should know that Being and non-Being are two opposites, and the sphere of divinity comprises both. It is a sum of two pairs of contradictories: eternal and created (hadith), God and the world, Being and non-Being. At this stage God appears in the form of the world and the world in the form of God.”²⁷

Divinity is the highest manifestation of the essence and is invisible, while its effects in the form of nature are visible everywhere. Essence is visible to the eye but its locus is not fixed or visible; we see it manifested but cannot describe its quality. Take the example of man. He is characterized by some attributes, all of which never come within the compass of our comprehension, though we see man all right. It means that essence is visible while its attributes are not. Of the latter we see nothing but effects. For instance, we see the marching forward on the part of a generous man. “Marching forward, and “giving alms” are not bravery and generosity respectively, but only the effects of these attributes.”²⁸

Mercifulness (rahmaniyyah) is the manifestation of the essence in the realities of names and attributes. It refers only to the creative and not to the creaturely attributes, while ilahiyyah refers to both. In this respect, mercifulness appears to be higher in scale than divinity, as sweetness of sugar does with regard to the sugar cane. If you prefer sweetness to the sugar cane, mercifulness is better than divinity, but if looking at the generality and comprehensive character of the sugar cane, you prefer it to sweetness, then divinity will be prior in rank. The name that manifests itself in this rank is that of Rahman (the Merciful) which includes both the attributes of the essence as oneness (ahadiyyah), uniqueness (wahdiyyah), eternity (samadiyyah), etc. and attributes of His Self which are seven, viz. life, knowledge, power, will, speech, hearing, and sight.”²⁹

The first mercy of God was the creation of the universe from His own Self.³⁰ His manifestation permeated all existents and His perfection appeared in every atom and particle. In spite of manifestation in the many, He does not become many but remains One as His nature demands. The nature of His permeation is that He created the world out of His Self which is not divisible.

God is the substance (hayula) of the universe.³¹ In order to clarify his position, al-Jili gives the example of water and ice. God is like water which is the reality of ice and the world is like ice which is nothing but water (i.e.

God) in a congealed form. The use of the term “ice” is only metaphorical and secondary, and not real. For the world and God are identical. “The world is nothing but ice, and ice, according to our opinion, is nothing but water. Or belief is that ice and water are identical.”³²

God permeates the whole of existence through His name Rahman and this permeation is neither incarnation (hulul) nor contact, for both these conceptions imply duality; as a matter of fact, He is consubstantial with existents (‘ain al-maujudat).

Lordship (rububiyyah) is the name of the rank which demands those names that require the being of the existents and comprehends such names as the knower (‘alim), the hearer (sami’), the seer (basir), the self-subsisting (qayyum), and the willing (murid). Each name under this category demands its logical correlate. The knower implies the object known and willing implies the objects towards which the will is directed.³³

There are four kinds of attributes: beauty (jamal), perfection (kamal), majesty (jalal), and essence (dhat).

Every divine name and attribute has its effect which reflects one of the three: beauty, majesty, or perfection. All existents absolutely reflect all the names and attributes of beauty and some of the names and attributes of absolute beauty, while hell is the manifestation of absolute majesty. The perfect man alone is the complete manifestation of all these divine names and attributes.

Al-Jili then deals with the ten main attributes: life, knowledge, will, power, speech, hearing, sight, beauty, majesty, perfection, even though they are so innumerable that none can comprehend them in their entirety.³⁴

1. Life

Complete life is the existence of a thing for itself, while incomplete or relative life is its existence for another. God exists for Himself, is living (hay) and, therefore, His life is complete and not subject to death. All creatures live for God and, therefore, their life is relative and hence subject to decay and death. Life of God as manifested in created beings (khalq) is one and complete and yet the creatures receive it in different degrees. In some, this life appears in its complete form as, for instance, in the perfect man and the exalted angels and those things which are not composed of material elements, as the Exalted Pen, the Preserved Tablet, etc. In others, this life appears in its real form but is incomplete, as, for instance, in animal, man, lower angel, and jinn, because though each of them lives for his own self and knows that he exists and possesses different attributes, yet his existence is not real, for he is far removed from the sources of life. In others, as in animals, life does not appear in its real form. There are others for whom life has lost its real significance and, therefore, they live for others and for themselves as, for instance, plants, minerals, etc.

Everything existent is alive, for existence by itself implies life, through different things manifest it in various degrees; some enjoy complete life while others have imperfect life. But if we look at the matter from the transcendental point of view, life of everything is complete, though there seems to be a quantitative difference due to the inherent capacity of the

thing itself. Life as such is a fountain, a unity, a substance, existent in everything by its own perfection and is not subject to diminution or division.

The essence of a thing is its life, that is, life of God, whereby everything subsists. The life of things with regard to themselves is created (hadith) but in relation to God it is eternal (qadim), for the life of a thing is in reality His life. “You should know that forms, shapes, actions, words, minerals, and plants to which we attribute ‘existence’ possess like man complete life by themselves and for themselves. But because most people do not know this fact, we include them in a category lower than that in which they should be placed. As a matter of fact, everything possesses being for itself and complete life with which it speaks, hears, sees, understands, and has power and will of its own and does what it wishes to do. This fact has been learned by me from direct revelation in mystic experience.”³⁵ In other words, everything, material as well as non-material, is, according to al-Jili, self-determined, and possesses a unique individuality of its own.

2. Knowledge

Of all the attributes, knowledge is nearer to life as life is nearer to essence. Every living thing (or everything, for, according to him, everything has life) possesses knowledge in one form or another. The first form of knowledge is instinctive or what he calls inspirational (‘ilm-i ilhami), possessed even by animals. The other is clear, necessary, or inferential knowledge possessed by man, angels, and jinn. Life and knowledge are correlated and each demands the other.

Al-Jili holds that knowledge by which God knows Himself and knowledge by which He knows the objects of the universe are one and the same and there can be no division or difference in the two. According to ibn ‘Arabi, God’s knowledge of the objects is dependent on what they (objects) give of themselves to Him. Commenting on the Qur’anic verse (3:178), “Verily God is not unjust to His servants,” ibn ‘Arabi says, “No, I dealt with them only according as I knew them, and I knew them only by what they ‘gave’ me of themselves of what they themselves really are.”³⁶

Similarly, discussing the problem of creation, ibn ‘Arabi says that when God says “Be” to a thing, it is not God’s will that brings a thing into existence because God wills nothing and commands nothing the existence of which is not made necessary by the very nature and laws of things themselves.³⁷ Thus, according to him, God’s will and knowledge are both dependent on the nature of the objects. Al-Jili rejects this view as wrong. God’s knowledge of objects, according to him, is totally independent of the objects themselves.

It is true, he says, and that God’s decree (hukm) with regard to a thing is determined by what its essence demands it to be, but it is wrong to infer from this that God’s knowledge of objects is thereby determined by the nature of the objects themselves. As a matter of fact, the objects demanded of Him that very thing which He knew by His universal, essential, and fundamental knowledge before they were brought into existence. God’s knowledge of objects is determined not by the necessity or demand of those objects but by its own inner demand.³⁸

3. Will

God's knowledge manifests itself according to the demands of His essence and it is will which gives existence to His objects of knowledge as His Knowledge demands. Our created will is identical with God's will, but when attributed to us it becomes temporal, while attributed to God it is eternal, just as Being when attribute to us is created (makhluq) and when attributed to God is eternal.

Here again he disagrees with ibn 'Arabi, according to whom God is nothing but the name of immutable laws which operate in the universe. "Ibn 'Arabi rules out not only the individual freedom of man, but that of God's will, as well. God does not will in the sense that he chooses, but in the sense that He decrees what He knows will take place. That the thing or action which God has decreed should take place depends entirely on its own necessary laws."³⁹

But, according to al-Jili, just as God is free and undetermined in His knowledge, so His will is absolutely undetermined and uncaused. God's will operates in every form and shape without any cause or condition; it is absolutely God's free act. He says that, according to ibn 'Arabi, it is wrong to call God free (mukhtar), for He does not operate in the universe by His free-will, His actions are determined by the necessity and nature of the objects. But, according to al-Jili himself, God operates in the universe through His free-will and is not determined by any necessity external to Him.⁴⁰

4. Power

It is an attribute of the essence which brings objects of knowledge into the world of actuality. Power is the creation or bringing into existence of objects from the state of non-Being.

Here, again, he controverts the position of ibn 'Arabi according to whom there is no creation at all. The objects of the physical world existed from eternity as objects of God's knowledge. What we usually call creation is nothing but manifestation of these already existing objects of knowledge on a different plane. There is no question of temporal priority or posteriority nor is there any creation ex nihilo at all.⁴¹ Al-Jili does not accept this position in toto.

He says that it is true that creation means the coming into actual existence of things which are previously the objects of God's consciousness.⁴² But ibn 'Arabi, according to him, forgot to note the fact that God's existence was prior to the existence of latent realities, things as objects of His consciousness (a'yan al-thabitah), and at this stage the things were non-existent and there was in existence nothing but Allah to whom alone we can attribute eternity (qidam). It follows that He created the objects of His consciousness from non-existence ('adam).

Allah is essence is independent and His being is first only as a matter of rank (rutbah); creatures are dependent on Him and, therefore, their being is posterior in the same sense. The creatures are non-being with reference to the First Being. There is no lapse of time between the non-existence of things and their becoming objects of God's consciousness.⁴³ The question of priority is only logical and not temporal.

The same line of argument is presented in discussing the nature of eternity (azal) and everlastingness (abad). Eternity is of two kinds. One is the eternity of a created thing. It refers to the time when it had no being. Eternity of one creature is different from the eternity of others. For instance, eternity of inorganic matter is different from that of organic substances, for it is prior to the latter. We can, therefore, speak of eternity with reference to the organic substances when the inorganic substances were in existence and had not yet developed and evolved into organic form; it does not, however, imply any temporal priority.

The other is absolute eternity which belongs only to God who is above Being and non-Being. God's eternity has no relation whatsoever with that of the creatures because He is (logically) prior to them. We cannot say, as ibn 'Arabi, for instance, holds, that in the state of absolute eternity the world existed, if not objectivity, as the object of God's knowledge, for if we accept this position, we would be bound to regard the verse (76:1) in support of his thesis, "Has there not been over a man a long period of time when he has nothing - to be spoken of?"

Al-Jili holds that time (dahr) in this context means Allah and a portion of time (hin) is one of His manifestations when man had no being, either as an intelligible ('ilmi, i.e. an object of God's consciousness in the form of latent reality) or an actual reality ('aini). The part of the verse "nothing - to be spoken of" signifies that he did not form the content of God's mind.⁴⁴

Similarly, when we apply everlastingness to God, it is logical and not temporal. "Eternity and everlastingness are only logical determinations and not temporal events in reference to God." "These two, i.e., eternity and everlastingness with their temporal implications, have been employed only to clarify the real existence of God (in relation to the world), otherwise (as a matter of fact) there is neither temporal eternity nor everlastingness. Time has no reference or significance in relation to God."⁴⁵

Difference between eternity and everlastingness is that eternity refers to the logical priority of God, while everlastingness means that He was never non-existent nor in need of an efficient causality for His Being. We apply to Him the term "everlastingness" only for understanding His eternity, otherwise ascription of temporal priority and posteriority to Him as related to the world is out of the question. Temporality (huduth) implies that things, although they have been in the knowledge of God since eternity, in respect of their existence are created things.⁴⁶

5. Speech (Kalam)

Speech is a reflection of the Being of God, it is an over-flowing or emanation (faid) from the essence of God. It is an intelligible epiphany. It manifests itself in two directions. The first is of two kinds. (a) The kind of speech (kalam) issues forth from God's position of power ('izzah) which must be obeyed by all. The Qur'anic verse 41:11, refers to this fact.⁴⁷ (b) The second kind of speech issues forth from the position of Lordship in the language of the people such as the revealed books. In this case, the question of obedience and disobedience arises. Some obey while others disobey the injunctions contained in them.

The second significance (direction) of speech is metaphysical and is the basis of the doctrine of Logos. The Word of God is the reality of the existents and every existent is a Word of God. Al-Jili refers to the Qur'anic verse, "If the sea were ink for the Words of my Lord, the sea would surely be consumed before the Words of my Lord are exhausted" (18:109). Thus, Nature is the materialization of the Word of God and exists in its physical form. It is the objective and material of the contents of God's consciousness, the physical shape that the objects of His knowledge, called a'yan al-thabitah, assume.⁴⁸

6. Hearing is Divine Epiphany

It is an attribute of His essence which His perfection demands. He hears the words of His own consciousness as well as those of His manifestations (shu'un). The second hearing (of the manifestations) is the demand of His names and attributes which are to be manifested in the physical world. It is revelation of Himself to Himself in the state of self-consciousness.⁴⁹

7. Sight

The attribute of sight with reference to seeing the object of knowledge is nothing but God as He is in His essence, and the same is the case with His attribute of knowledge. With regard to the epiphany of knowledge which is the originator of the universe, it is the revelation of the attribute of knowledge from Himself to Himself, while the epiphany of 'ain, which is the objective physical world, is the manifestation of the attributes of seeing, and both are identical with His essence. Seeing and knowing are two different attributes and yet, with reference to His essence, they are one: His seeing is His knowing. When the things were on the plane of the unseen, they were the objects of His knowledge, when they appeared on the plane of existence; they became the objects of His hearing.⁵⁰

8. Beauty

It is of two kinds. The first is real and is reflected in the "beautiful names" in which God sees Himself. The second is sensory and reflected in the physical created world. He is the absolute beauty, and reveals Himself in its different manifestations.

9. Majesty is Beauty in its Intense Form

Beauty signifies His exalted attributes, while majesty is His essence as manifested in His names and attributes.

10. Perfection is the name of Divine Essence which is perfectly unknowable

All attributes of God are identical with His essence and not added to it and so perfection is His by His very nature.⁵¹

Self-revelations of the One

The ultimate Reality, according to al-Jili, is One which manifests itself in the multiplicity of forms without thereby becoming many. The state of the One before It revealed Itself is called, after ibn 'Arabi, blindness (al-'Am'). The term was adopted from a prophetic tradition. The Holy Prophet was once asked about the place of God before creation. He answered that God

was in 'Ama'. On the basis of this simple answer, ibn 'Arabi and al-Jili have built a super-structure of their pantheistic systems.

The essence is Absolute Being in which all relations, modes, and directions disappear. As such it cannot be called a necessary or eternal being for this implies determination of one sort or another. It is even above the characterization of absoluteness.⁵² Al-Jili calls this essence 'Ama' and describes it as essence in its inwardness. It is like a flint which hides fire in its innermost recesses. Though sometimes fire is revealed, yet it remains hidden within it. It is the Reality of realities which is above the distinction of God (Haqq) and the world (khalq), beyond the determinations of names and attributes.⁵³

It is the one epiphany which has no relation whatsoever with "other." In spite of this, it comprises within itself all (later) manifestations or revelations which are present in it only potentially like stars in the light of the sun. In this epiphany of essence, God knows nothing but Himself, while in other epiphanies He knows Himself as well as others.⁵⁴

This state of blindness is related to the Absolute Oneness (ahadiyyah), in both of which names and attributes are annihilated and nothing is manifested, with the difference that in the former the inward aspect is emphasized, while in the latter its outward aspect takes its form. 'Ama', with regard to inwardness and occultation or hiddenness, is the essence, while Absolute oneness with regard to God's manifestation to Himself in His mind (nafs) in which all relations are negated.⁵⁵

Absolute Oneness denotes that the Pure Being is about to start on the process of descent, coming down towards manifestation.⁵⁶ This is the first stage of the descent or self-revelation of the essence from the darkness of 'Ama' to the light of manifestations. At this stage, unity is complete and all multiplicity is negated, although it resides in it; it is divested of all attributes, names, relations, and modes, and yet they all lie hidden in its innermost being. Its apparent unity is identical with its hidden plurality. It is like a wall when seen from a distance.

Although it is composed of different constituents like bricks, mortar, etc., and is, thus, a plurality, yet it shows itself to an observer as a unity which has a peculiar existence of its own and is not merely a conglomeration of different parts. It is the first self-revelation of the One and is above the distinctions of God and the world. No one can claim to receive illumination from the One at this stage, for it is beyond all multiplicity; what we experience is really unity in its second stage, Rabb or Allah.⁵⁷

The unity (ahadiyyah) of God at a particular stage of manifestation spreads out into a pair of opposites which later on are reunited at the stage of uniqueness or simple oneness (wahdiyyah). The intervening stage between ahadiyyah and wahdiyyah is represented by He-ness (huwiyyah) and I-ness (aniyyah).⁵⁸

Ibn 'Arabi employs the term huwiyyah (He-ness) as equivalent to divine essence.⁵⁹ But for al-Jili this He-ness is a stage removed from the essence. It is derived from the pronoun huwa (he) which refers to the "absent one" (aha'ib) and, therefore, refers to the essence of God from which names and attributes are absent, that is, to His unity which negates the many. It is the

inward aspect of the unity which informs us about its inwardness (batin) and absence (ahaibubiyah). It is the inmost consciousness of Allah.⁶⁰

Aniyah (I-ness) is the outward aspect of unity in which One blossoms forth into multiplicity. Zahir (outward) and batin (inward) are not two different aspects of the One but only Its different views; as a matter of fact, the outward and the inward are identical. He-ness and I-ness, outwardness and inwardness refer to the reality which is signified by the name Allah because ilahiyyah is a sum of contradictories.⁶¹

The stage of self-revelation called simple Oneness (wahdiyyah) is the manifestation of the essence in which all different attributes are gathered together. Here everything is One and many, many is One and One many.

At this stage, essence is manifested as attribute and attribute as essence. Every attribute is identical with the other, as generosity is with revengefulness, for both are identical with (and 'ain of) Allah. In ahadiyyah, there is no manifestation of names and attributes and the Real is the pure essence. In wahdiyyah, names and attributes as well as their traces and effects are fully manifested, but they are not separate from the essence; here every attribute is identical with (the 'ain of) the other. In ilahiyyah names and attributes are manifested but are distinguished one from the other and are even contradictory to one another.⁶²

Ascent of the Soul

The different grades of the self-revelations of the One are only a logical description of how, according to al-Jili, the Real, i.e., God, manifests Himself in nature and man. It is man in whom He becomes self-conscious and who realizes the ultimate truth that there is no multiplicity or division, for reality is one. But, as al-Jili says, this realization does not dawn on him all of a sudden. It is not possible for man to realize and comprehend all the divine realities at the time of birth. He ascends to the truth only by gradual stages.⁶³ Al-Jili enumerates four different stages which man has to traverse before he is able to achieve unity with the source and origin of life, the One.

1. Illumination of Action

At this stage man feels that God permeates all objects of the world; it is He who moves them and is ultimately responsible for their rest. The power of performing action is attributed by al-Jili to God only and man is looked upon as devoid of all power or will. He enumerates several degrees and grades of this stage. There are some who first see the divine will and then look to the action and, thus, they are made to realize the conflict between God's will and religious injunctions. There are some who follow His will, although thereby they violate His order (amr). With regard to the first, i.e. will, they are obedient, while, with regard to the second, they are classed among the disobedient. Al-Jili leaves the problem unsettled by asking the question, "Is it better for man, in order to win God's favour, to put on the dress of disobedience for the sake of fulfilling God's will or to put on the dress of obedience and defy thereby His will, though, as a matter of fact, only that happens which is according to the will of God?"⁶⁴

2. Illumination of Names

When a mystic receives illumination from any one of the divine names, his being is completely submerged under the light of the name. Both are greatly identified that when anyone calls God by that name the response comes from the mystic. The result is that he comes to realize his unity with the Real. “Anyone who calls Laila (my beloved) by her name receives answer from me; when anyone calls me, then Laila answers on my behalf. We are one soul though in two different bodies or us two are like a person who in essence is one but has two names. As a matter of fact, we are not two persons that have become one, bur are one; the lover is the beloved.

Al-Jili enumerates several grades and degrees of this illumination, all of which are based on his mystical experiences. Other people may arrive at a different set of stages on the basis of their mystical experience. The first is the illumination of the name Eternal (Qadim). Here God reveals to man his position as he existed before the creation of the world in the consciousness of God (i.e. as ‘ain al-thabitah). His physical existence vanishes.

As the knowledge of God is eternal, so are the objects of His knowledge. This being so, the man who receives illumination from the name Eternal ipso facto loses his temporality and becomes as eternal as his latent reality (‘ain al-thabitah). He who receives the epiphany of the name al-Haqq (the Truth) realizes the hidden truth contained in the Qur’anic verse (15:85), “We created the heavens, the earth, and whatever is in them with truth.” For him the phenomenal world ceases to exist and only the essence, devoid of all attributes and relations, remains. There are others who receive epiphany of the name al-Ahad (the One). God reveals to them the true nature of the phenomenal world and they realize in their mystic revelation that this world is a reflection (buruz) of His essence and is related to Him as waves to the sea. In this state the mystic sees the One in the many; rather, the many disappear altogether and only the One remains as the Real.

Al-Jili sums up his position in these words, “I lost my (separate) being (wujud). On my behalf He represented me; rather, He was I and I, He. Being was one and there was no conflict or difference. I was annihilated and achieved abiding life (baqa’) with Him and in Him, and all the veils of difference and dualities were removed. I raised my self (nafs), the veil was lifted and I awoke as if I had not fallen asleep. With the eyes of reality I found myself as Haqq. Then His attributes became my attributes and myself (dhat) His essence. As a matter of fact, my name is His name and the name of his essence is my name.

There are some who receive light (tajalli) from the name al-Rahman (the Merciful). At this stage, the mystic receives illumination gradually and turn by turn from all the divine names and is illumined according to the capacity of the light inherent in his nature. Then the name Rabb (Nourisher) and all other names that are related to it like ‘Alim (Knower), Qadir (Powerful), etc. descend on him. This process goes on until he is illumined by all the names. Last of all comes the epiphany of the Name Qayyum (Self-Subsisting). This is the final stage after which the mystic passes on to the next higher stage of the illumination of divine attributes.⁶⁵

3. Illumination of Attributes

At this stage, the self (nafs) and existence (wujud) of the mystic are annihilated. When the light of slavehood ('abdiyyah) and the spirit of creatureliness in him pass away, God substitutes in his body, in place of the thing that has been snatched away, a spiritual substance of His own essence without incarnation. This spiritual substance, called the Holy Spirit (Ruh al-Quds), becomes an inalienable part of his self. God's epiphany to man in this state means His epiphany to His own Self, we call man slave, though, in reality, and there is no distinction between Lord and slave. When slave disappears, his logical correlate, Lord, must also disappear. The creatures are like waves which, though many, are parts of the sea. If the sea is in motion, it is all waves; when it is calm, there are neither waves nor number (i.e. multiplicity)."

He enumerates several grades of this illumination which different people attain according to their inborn capacities and the magnitude of their knowledge of the power of their will. When a person is illumined by the divine attribute of life, he feels that he is the sole source of life as manifested in all the creatures in different proportions. Al-Jili says that when he was at this stage he felt that he was life itself, one and indivisible.

When a mystic is illumined by the attribute of knowledge or sight, he knows the reality of everything that was, is and will be and sees everything, even the unknown of the unknown (ghaib al-ghaib). When he is illumined by the attribute of hearing, he hears the speech of every creature: minerals, plants, animals and angels.

Some receive the light of the attribute of speech (kalam). In this condition, the recipient looks upon all existents as God's Word. Sometimes he hears the Words of God without a veil of names, without any direction, without the help of any bodily organ. This hearing of God's words cannot be described in usual physical terms, for the ear does not play any part in it. In this state man attains a very high position. He is addressed by God as His lover and beloved. "You are My mouth among My people. You are My inmost secret and the best reflection of My life. You are My name, My person (dhat), My attribute. You are the epitome and the (final) object of existence and creation (huduth). If there had been no Lord (Rubb), there would have been no slave. You manifested Me as I manifested you. You brought me into existence, as I created you. If you had not been existent, I would not have been existent. My lover, I am the (hidden) meaning of you and you are the (apparent) manifestation of Me."

A man who reaches this stage receives God's Word according to his capacity. When carried to the Highest Tree (sidrat al-muntaba) he is addressed by God. Then he sees light in the heart and is convinced by its very brilliance that its source is God. He is told, "My friend, your I-ness (aniyyah) is my He-ness (huwiyyah). 'You' is identical with 'I.' Your simplicity is My compositeness and your compositeness is My simplicity. You are a point (centre) round which the circle of existence revolves, and in that circle you are the worshipper as well as the worshipped; you are the light, the manifestation, the beauty."

Some are illumined by the divine attribute of will. At this stage the illumined person sees that everything in the world is subject to his will.

Some are illumined by the attribute of power. At this stage, which al-Jili claims to have reached, he heard the ringing of bells, his whole physical body seem to have been torn asunder and his existence changed into non-being. He experienced here darkness upon darkness until by the grace of God he was relieved of all this and came upon light. At this stage, the illumine one gets extra-ordinary spiritual powers, a thing comes into existence at his bidding. The last stage is the illumination of the attribute of divinity (ilahiyah), where two contradictory positions seem to be reconciled and incorporated into the world as true and yet he looks upon all of them (including Islam) as false, for, according to him all Muslims, believers, gnostics and the righteous ones are on the wrong path and he does not accept the opinion of any but the perfect Sufi (muhaqqiq) as true.⁶⁶

4. Illumination of the Essence

When God reveals Himself to man through this epiphany, man dies to himself and, in place of that, receives from God a divine substance (latifah ilahiyah) which is either attributive (sifati) or essential (dhati). When this substance is essential, i.e. when man is illumined by divine essence, he truly becomes a perfect man.⁶⁷

Doctrine of Logos and the Perfect Man

According to al-Jili there are three metaphysical categories: (1) Absolute Being which is completely unknowable. It is the essence above all kinds of determinations, relations, and modes.⁶⁸ (2) The reality viewed as Haqq, the aspect of He-ness or Divinity. (3) The reality viewed as khalq, the aspect of I-ness, or humanity. Ultimate Reality is One, but it appears in two different aspects of God and man (Haqq and khalq).⁶⁹ Sometimes he expresses this doctrine in a form which most Western writers (like Nicholson) construe to be the acceptance of the Christian doctrine of Trinity. Al-Jili says, “Essence has two aspect: ‘You’ and ‘I...’ ‘You’ refers to your He-ness (huwiyyah); ‘I’ refers to my reality... ‘I,’ as ‘I’-ness, is God and ‘You’ in its creaturely aspect is man. You make look at yourself as ‘I or as ‘You’; in reality, there is nothing here except the Universal Reality.”⁷⁰

Later on, al-Jili says, “In itself the essence is one. If you say it is one, it is true. And if you say, it is two, and then it is, as a matter of fact, two. If you say, ‘No, it is three,’ you have spoken the truth.” Explaining it further, he says, “Look at His oneness (ahadiyyah) which is His essence and here He is one (wahid) and unique. If you look at Him with regard to the two aspects of Creator and creature, Lord and slave (Rabb and ‘abd), He is two. And if you look at His real nature and at that wherein two contraries are gathered together, you will be amazed. You will not be able to call His loftiness lowly and His lowliness lofty. You will have to fix a third name to illustrate His nature which is characterized by the two attributes. This third thing is that whose name is Ahmad with reference to the celestial sphere and Mohammad with reference to the terrestrial sphere.⁷¹ This is the doctrine of Logos or the perfect man which he discusses in detail in the 60th chapter of his book.

The perfect man, according to him, is the Pole (Qutb) on which the sphere of existence revolves from first to last. He has been one and

unchangeable since being came into existence. He is dressed in different ways and in each guise he has a different name. His real name is Mohammad. In every age he has a name which is most suitable for that time. Referring to his personal experience he says that he had a chance of seeing him (i.e. Mohammad as a perfect man) in the form of his Sheikh, Sharf al-Din al-Jabrati, at Zabid in 796/1393, though he did not know at the time that he was Mohammad. The Holy Prophet, as a matter of fact, in his capacity as the perfect man, has the power of assuming different forms.

When the mystic observes him in the form which he possessed in his earthly life, he calls it the form of Mohammad. But when he (the mystic) sees him in some other form, though he knows that it is in reality, Mohammad applies to nothing except the reality of Mohammad (haqiqat al-Mohammadiyyah). Al-Jili is, however, very careful to point out that this is not the doctrine of metempsychosis. Mohammad has the power, according to him, to manifest himself in different forms and he has been appearing in the form of the perfect man in every age. Such men are outwardly his (i.e. Mohammad's) vicegerents, while inwardly he constitutes their essence.⁷² At another place, al-Jili calls Mohammad as "the heaven and the earth and the length and the breadth."⁷³

The basic reality of Mohammad is present in all people in proportion to their inherent capacities. Saints and prophets all partake of it in different degrees, while Mohammad alone possesses it in its fullness and, therefore, according to al-Jili, nobody except he can be called a truly perfect man.⁷⁴ Different names and attributes are manifested individually and separately in different saints and prophets, but in the perfect man they are manifested in their totality.

The perfect man is the whole of reality in miniature; he is the microcosm who combines in himself the inward and the outward aspects of reality. He is the copy of God as a tradition of the Prophet says, "Allah created Adam in His own image." God is living, knowing, mighty, willing, hearing, seeing, and speaking and so is the perfect man. Then there is the perfect man's he-ness (huwiyyah) as against God's He-ness (huwiyyah), I-ness (aniyyah) against I-ness, essence against essence, who against whole, universal against universal, particular against particular.⁷⁵

The microcosmic character of the perfect man is further explained by al-Jili as follows, "The perfect man in his essence represents all the realities of existence. In his spirituality he corresponds to the spiritual realities and in his corporeality to the physical realities. His heart corresponds to the Throne of God (al-'arsh),⁷⁶ his aniyyah to the Heavenly Chair (kursi),⁷⁷ his mind to the Exalted Pen (al-qalam al-a'la),⁷⁸ his soul to the Guarded Tablet (al-lauh al-mahfuz),⁷⁹ his nature to physical elements, his potentialities to hayula, etc., etc. In short, every faculty of the perfect man corresponds to different manifestations in the physical world."⁸⁰

According to al-Jili, there are three stages (barzakh) of development for the perfect man. In the first stage called beginning (bada'ah) the perfect man becomes endowed with divine names and attributes. In the intermediary stage (tawassut) he is able to grasp both divine and human realities. When he is able to acquire all that is possible to do at this stage, he gets knowledge

of all hidden things and becomes aware of the secrets of the unseen world. In the third and final stage (khitam) he acquires creative power and is given full authority to manifest this power in the world of nature. “At this stage, there are only two things: he, the perfect man himself and God the Great.”⁸¹

He is called “the guide” (al-mehdi) and the seal (al-khatam). He is the vicegerent to whom God refers in the story of Adam. All things are drawn towards him in obeying his order as an iron is attracted by the magnet. The entire world is subdued to his power and greatness, and he does what he wishes to do. Nothing remains hidden from or unknown to him. The saint (i.e. the perfect man) possesses the divine substance as simple essence (like God Himself) and is not limited by any rank (martabah) of Creator and creature,⁸² and as such he is able to bestow on things what their nature demands without any lot or hindrance.⁸³

Saint ship and Prophethood

Al-Jili quotes Sheikh ‘Abd al-Qadir on the authority of ibn ‘Arabi, “Oh prophets, you have been called prophets but we have received something which you did not get.” Another mystic says, “We have dived in the river (saint ship) while the prophets are staying at its banks.” Al-Jili remarks that there is truth in these statements, but a prophet as prophet is superior to a saint qua saint.⁸⁴

Al-Jili regards prophethood as a developed stage of saint ship. The seventh stage of the spiritual development is nearness (qurb) which he calls great saint ship (wilayat al-kubra). It has four aspects. The first is friendship (khullah), the position attained by Abraham. The second is love (hub), where Mohammad was given the rank of a lover of God (habib Allah). The third is finality (khatam), the rank of Mohammad (maqam-i Mohammadi) where the banner of Ahmad was hoisted for him. The last and fourth is the rank of slave hood (‘abdiyyah) where God called him by the name of slave (‘abd).⁸⁵ In this rank he was made a prophet and sent with a message to the people.

Other people who succeed in attaining this rank are only entitled to be called slaves and they are the vicegerents of Mohammad on all planes (hadarah) of existence. There are some saints who have undergone spiritual discipline and attained perfection, but their objective is not the reform of the people. Such saints are prophets, but their prophethood follows from that of Mohammad. They are his brothers about whom there is reference in the following tradition, “I have a great regard for those of my brethren who will come after my death.” These people are prophet-saints. The prophethood of these saints, according to al-Jili, is institutional (tashr‘i) but that of nearness, propagation (of the message of the Holy Prophet), and enforcement of the divine Law. These prophet-saints receive their prophetic knowledge directly i.e. from the same source from which the prophets derive their knowledge.⁸⁶

Al-Jili draws a distinction between saint ship (walayah), prophecy of saint ship (nubuwwat al-wilayah), and prophecy of institution (nubuwwat al-tashri‘). Saint ship is a rank in which God reveals to a mystic His names and attributes through knowledge, state, and power and, thus, becomes his protector and friend (mutawalli). In the prophecy of saint ship, the perfect servant (al-‘abd al-kamil) is commanded by God to turn his attention to the

people so that he may reform them in the light of the divine Law towards a better moral and spiritual life. He who performed this task before Mohammad was an apostle (rasul) and he who undertook this work after him is his vicegerent, but in his missionary work he has no independent status; he is the follower of Mohammad, like such saints as Bayazid, Junaid, ‘Abd al-Qadir Jilani, ibn ‘Arabi, etc. He who enjoys an independent status and does not follow any other prophet belongs to the rank of prophecy of institution, but this has come to an end after the death of Mohammad.

Thus, saint ship represents a peculiar relation between the Lord and the servant, prophecy of saint ship is an aspect of the saint which is common between the Creator and the creature; prophecy of institution is an independent and permanent assignment, an apostleship is an aspect which refers to the relation between the (Lord’s) servant and the creatures.

A prophet is a saint as well as a prophet, but the aspect of his saint ship is superior to the aspect of his prophecy, though every prophet-saint is superior to a saint.⁸⁷ According to al-Jili, Mohammad is the final prophet because he did not leave any wisdom, guidance, knowledge, and secret unexplained. Whatever was necessary for the people to know and learn had been communicated by him. No Sufi saint can know or experience anything which was not experienced by him and, therefore, he cannot but follow him. “After Mohammad institutional prophethood came to an end.”⁸⁸

Psychology - Qalb

The term “heart” (qalb) is very often used by the mystics as the repository of the innermost secrets of divine knowledge. It is definitely not the physical organ of the human body but a symbolical term for the rational or spiritual aspect of man. Following ibn ‘Arabi, al-Jili identifies it with the spirit of God which, according to the Qur’an, was breathed into Adam (15:29).

The heart (qalb) is the eternal light which was revealed in the essence (‘ain) of existents (i.e. in Mohammad or the perfect man), so that God may see man through it. It is the centre of God’s consciousness and the circumference of the circles of all existents. It symbolizes that which is described in the Qur’an as the light (24:35). It reflects all the divine names and attributes and yet at times it directs its attention to some particular name and then becomes a complete reflection of it.

The true nature of the heart is divine and pure.⁸⁹ But due to animal passions sometimes it loses this purity which, however, can be recovered after a period of physical and spiritual training, the duration of which varies according to the degree of influence of the animal passions. Al-Jili holds that certain men of eminence subjected themselves to a rigorous mystic discipline as a result of which they received divine illumination as a right and not as a favour. In his support he quotes a verse of Sheikh ‘Abd al-Qadir Jilani who says, “I continued grazing in the fields of rida’ (submission to God’s will) and attained a rank which was the result not of God’s favour (but of my own efforts).”

Qalb is like a mirror to the realities of Being or it may be called the reflection of the universe. God says, “The sky and the earth do not contain

Me, it is only the heart of My believing servant which can contain Me.” This statement, according to al-Jili, proves that the heart is primary and the universe is only secondary.

God’s comprehension by the heart is of three kinds: (a) by knowledge. Heart alone is able to comprehend and know God as He is. Other things can and do know God either in one or other of His aspects, but heart alone can know him in all-comprehensiveness. (b) By observation (mushahahadah). Through this seeing (kashf) the heart observes the beauties of the face of Allah and enjoys the taste of His names and attributes. (c) By vicegerency. At this stage, man becomes a complete embodiment of divine names and attributes so much so that he feels his essence to be identical with divine essence. He then becomes God’s vicegerent.

Reason

There are three kinds of reason: the first intelligence (‘aql al-awwal), universal reason (‘aql al-kulli) and ordinary reason (‘aql al-ma‘ash). The first intelligence is the locus of the form of divine knowledge in existence and as such it is identical with the Exalted pen. It contains explicitly and analytically what is contained implicitly and synthetically in divine consciousness. It is the light of divine knowledge which became the first manifestation of the essence in the phenomenal world.⁹⁰

Universal reason is the luminous percipient in which those forms of knowledge are made manifest which is deposited in the first intelligence. Al-Jili rejects the view of those who regard universal reason as the sum of reasons of all rational beings, for reason are a unit and a substance.

Ordinary reason is a light which is judged and measured by the laws of reflection. Its sphere of activity is confined only to one of the several aspects of the universal reason; it has no access to the first intelligence which is beyond logical inferences and is the sphere where sacred revelation takes place. Ordinary reason has only one scale, i.e., of nature, while knowledge gained through ordinary reason is of limited scope, fallible, and is mostly of the nature of conjecture. He relates the three reasons as follows: the first intelligence is like the sun, universal reason is like water which reflects the rays of the sun, while the ordinary reason is like the reflection of water which falls on a wall.⁹¹

Judgment (Wahm)

The wahm of Mohammad was created by God from His perfect light and, therefore, it was manifested in the phenomenal world in a perfect form. Wahm is the strongest faculty possessed by man because it over-powers reason, reflection, and imagination. It has, thus, the greatest capacity of (intellectual) apprehension and preservation. It has power and influence over all existence. It is through it that an intellectual person is able to acknowledge God and worship Him. It is the light of certitude and anyone who is able to attain supremacy over it becomes the master of the two universes, terrestrial and spiritual. But he who is over-powered by it becomes subject to darkness and bewilderment.⁹²

Himmah is concentration of mind upon an object. It corresponds to what is usually called will or power of will. It is a very powerful faculty which,

according to al-Jili, is always busy in the contemplation of God. If anybody decides to attain a particular objective and concentrates his will upon its attainment, he is sure to succeed in his aim. There are two necessary conditions for success, (a) determination in thought about the possibilities of the success or otherwise of the objective and then a conviction about the result, and (b) concentration of all effort on its achievement. If anybody fails to manifest this type of activity, he has no chance of success. In the beginning one encounters great difficulties and hindrances but, once they are overcome, man is on the verge of conquest of his self as well as of the physical universe.

Al-Jili makes a distinction between will (himmah) and attention (hamm). The object of the former is God and the spiritual world, while that of the latter is the physical world and pursuits related to it. But for a mystic it is not proper to stay at the stage of attention for long, because after some time it becomes a hindrance to future progress.⁹³

Reflection (Fikr)

It is a key to the Unseen. According to al-Jili, there are two methods of approaching the Unseen: (a) pertaining to God, which is attained through divine names and attributes, (b) pertaining to the world which depends on realizing the true nature of man, all of whose aspects are ranged against the aspects of the Merciful. One of these aspects is reflection by which we can peep into the mysteries of the Unseen. When a man is able to attain perfection in the exercise of reflection, he sees spiritual objects in a physical garb.

This ascent ('uruj) is of two kinds: (1) One kind of ascent is achieved by traversing the path chalked out by the Merciful. The man who adopts it is on the straight path and attains creative powers. (b) The second kind of ascent is the "red magic" which is involved in thought and imagination and in which truth and falsehood are mixed together. It is the path of speculative thought which lands man in the morass of uncertainty and doubt.⁹⁴

But it does not imply that the exercise of reflection should be condemned outright. Al-Jili admits that reflection has the potentiality of leading men astray from the right path, but he also suggests certain principles by following which it is possible for men to benefit from the light of reflection and save themselves from its pitfalls and darkness. The first principle, according to him, is reason ('aql), which is in perpetual quest, as well as the acquired experience the veracity of which has been testified by men in their mystic life. The second is naql, i.e. knowledge gained through a study of the Qur'an and Tradition, by which a man comes to believe in the reality of the Unseen. But if a man refuses to follow these principles and gives himself over to purely discursive reason, he is sure to be led astray.⁹⁵

The Self (Nafs)

According to al-Jili, as the title of chapter 59 illustrates, self is the origin of Lucifer (Iblis) and other evil powers. But it does not imply that the origin of the self itself is evil, for, as al-Jili says, its origin is the spirit itself of Mohammad. "The self of Mohammad was created by God out of His own Self and the self of Adam was made a copy of the self of Mohammad."

Later on, he says, “Allah created the self of Mohammad from His own essence and as his essence is the unity of two contraries, two contraries emanated from Him.”

Satan was cursed for his act of disobedience but this curse, according to al-Jili, consisted in removing him from divine presence. The period of this separation is limited to the Day of Judgment after which he will be reunited with the divine presence. Thus, according to al-Jili, self is spiritual in origin and does not represent any evil power which is antagonistic to the forces of good. “The self is the inmost secret of the Lord and (a part of) His essence on account of which it has delights. It was created out of the light of attributes of Lordship and, therefore, possesses lordly qualities.” Al-Jili, therefore, identifies self with the soul which was breathed into Adam and enumerates the following five stages of the development of the soul on the path of spiritual progress:

1. The animal soul is an aspect of the soul which governs the body.
2. The evil-prompting soul (nafs al-ammarah) is that aspect by which the soul is engrossed in fulfilling the demands of passions and, thus, becomes indifferent to divine commandments and prohibitions.
3. The inspired soul is that aspect by which human soul is directed and guided by God to do good action.
4. The self-reproaching soul is that aspect by which man is engaged in subduing his inclinations and passions and in turning his attention to God.
5. The tranquil soul is that aspect because of which all evil inclinations are totally removed and man feels satisfied with God.

But beyond these five stages, there is a final stage where body is completely under the control of the soul and partakes of the knowledge of the Unseen and is able to fly over the earth, etc. At this stage man is characterized by God’s attributes and becomes identical with His essence.⁹⁶

Religion

A theory of life which is based on pantheism ends in a conception of religion which is universal. As the unity of Godhead is manifested in the multiplicity of divine names and attributes, so the basic urge of man to worship God takes various forms all of which are equally valid and right. He argues his case on the basis of certain verses of the Qur’an and traditions. He holds that all existent things are created for the purpose of divine worship. Everything by its state and activity, nay bit is very nature and attributes, actually does worship God and, therefore, all existents are servants or worshippers of God.

The forms of worship, however, due to differences in the nature of names and attributes, are different. Though humanity was originally and by nature one, yet due to differences resulting from the manifestations of diverse names, people adopted various pathways towards God - pathways which appeared right to the people and which God had decreed for them; for none follows a path except that which he wish them to follow and all paths are undoubtedly paths leading to Him as the following verse of the Qur’an indicates, “There is no living creature but He has it in His control.” (11:56).

Death is the extinguishing of the vital heat, while life is the soul’s concentration on the body. The life of the body is maintained only so long

as the soul continues to look at it. After death, the soul assumes a bodily form appropriate to it in accordance with the place it occupies. Some mystics wrongly deny resurrection of the body. Al-Jili believes on the basis of his personal experience and observation that bodies along with souls shall be resurrected.⁹⁷

The stage intermediate between death and resurrection (barzakh) is an incomplete and non-permanent stage of life after death. It is a world of fantasy. There the people will meet with the forms appropriate to their actions. If a man had been doing good actions, he would experience different forms and shapes of these actions which would carry him progressively to better states. Similarly, an evil-doer would experience torments which will gradually increase in their intensity.

Al-Jili enumerates eight different levels of paradise the last of which, called the lauded station (maqam al-mahmud), and is meant for none but Mohammad. It is the paradise of the essence. Similarly, he describes seven different grades or levels of hell.

But after giving a graphic description of hell and heaven, al-Jili denies their existence as separate localities. As the epiphanies of the Lord, they are on an equal level; the inmates of hell will receive tidings of punishment as the people of paradise will receive tidings of reward.⁹⁸ Hell is nothing but the natural darkness which is fire.⁹⁹ In the 59th chapter he discusses in detail the nature of Iblis and his manifestations and yet he asserts that Iblis is not an individual; it is only the personification of the evil aspect of man's nature.¹⁰⁰

He tries to explain away the usual significance and nature of fire in hell. God will create in the people thrown into hell the power to bear punishment and, thus, this punishment will change into pleasure.¹⁰¹ But even then this so-called punishment in hell will not last forever.

Al-Jili thinks that the beatific vision is the manifestation of God's tajalli and His nearness is not confined to the people of paradise or the so-called next world. Every individual, here in this life and in life after death, whether he is placed in hell or in paradise, continually receives God's tajalli; as a matter of fact, his existence is all due to it.¹⁰²

According to al-Jili, God's will is absolutely free from external restraints; His actions are not determined by causes and conditions.¹⁰³ Man, on the other hand, according to him, is completely determined in his action.¹⁰⁴ He says that revealed books demand obedience, while people as a matter of fact act as they are determined by their nature. Freedom of choice (ikhtyar) is attributed to them only formally so that God's way to man may be justified.¹⁰⁵

God's decree, according to al-Jili, is of two kinds. One is unchangeable and in conformity with the demands of the divine attributes and as such is not subject to change. The other kind of decree is that which takes place according to the law of nature as demanded by the inherent capacity of the existents. Decrees of the latter type sometimes do not come to pass due to the contingent character of the things of the world.

Al-Jili subscribes to the doctrine that Being as Being is good and evil is only relative and apparent. With regard to the Real, there is no distinction

between good and evil, for everything without any distinction is the manifestation of the divine beauty and is as such good. Evil or defect in the phenomenal world is only due to certain relations. Fire is evil for a person who is burned but is good for the insect that lives in it and gets nourishment from it. In short, there is nothing in this world which is absolutely evil.¹⁰⁶

Al-Jili holds that what is called sin or disobedience is, in one respect, obedience between God's will and His command as enunciated by ibn 'Arabi. Sometimes an action takes place in full conformity with God's will, though His command may be against its occurrence. In such a situation man is disobedient with regard to His command but obedient with regard to His will. This point of view affects al-Jili's treatment of Satan's role. God rebuked him for his disobedience but he neither repented nor bewailed nor tried to seek forgiveness, for only that comes to pass which is according to God's will.

Al-Jili enumerates seven stages in spiritual progress. The first is what he calls Islam which covers five principles: declaration of God's unity and Mohammad's prophethood, prayer, fasting, poor-tax and pilgrimage.

The second stage is faith (iman). It is the first manifestation of the world of the Unseen and implies heart's acceptance of the truth thus revealed. It is something different from reason. Faith is not belief in a fact arrived at through discursive reasoning but acceptance without rational argumentation. Light of faith is superior to the light of reason. Kalam (scholastic theology) was invented to defend religion against disbelievers and innovators (ahl al-bid'ah). It never helps in producing faith in a person.

The third stage is called piety (salah) which results in good actions. But the motive is desire for divine rewards and safety from punishment. A person at this stage leads a life of obedience to the laws of the Shari'ah for the sake of his self.

The fourth stage is called ihsan where one observes the effects of divine names and attributes. Such a person does good actions not for the sake of his own self nor for rewards, but for his love for God.

The fifth stage is martyrdom (shadadah) which is of two kinds. The lower grade represents the death of a person in an epidemic or on a journey or in the battle-field for a righteous cause. The higher grade of martyrdom is to see the Real in every existent.

The sixth stage is called siddiqiyah which is signified by the mystic saying, "He who knows his self knows the Lord." This stage has three different planes. The first is faith through knowledge or reason ('ilm al-yakin). The second is faith through personal experience and mystic kashf ('ain al-yaqin). The third is true and perfect faith (haqq al-yaqin). The mystic who has attained this stage of siddiqiyah passes through all these planes of faith. In the first, he sees the Unseen and is able to observe with the light of faith those secret realities which are not open to the common people. Here he attains fana' and then reaches the stage of baqa' where he receives the tajalli of all divine names one after the other. He perceives the essence through names. This is the final plane of 'ilm al-yaqin.

In the next plane, i.e. of 'ain al-yaqin, he receives illumination from the divine attributes one by one until he feels himself one with the Real in Its

aspect of attributes. He progresses gradually until names and attributes lose their significance for him. He attains gnosis of the essence and through it he is able to understand the operation of names and attributes. He now knows the essence through the essence. Thus, he reaches the third and the highest plane, i.e. haqq al-yaqin, which is the first step in the seventh stage of nearness (qurb).

Here man is able to manifest in his person different attributes of the Real, though this manifestation cannot be total and absolute. A person who is able to bring a dead man to life, for instance is manifesting a particular attribute of God, though in a limited form. He stands in nearness to God. The first step in this stage is the station of friendship where he is able to create through the word “Be” (kun) after the manner of God. In the words of a tradition, “God becomes the ears by which he hears, the eyes by which he sees, the tongue by which he speaks, the hands by which he holds, the feet by which he walks.” The second step in this stage is the station of love where the lover and the beloved become one and where the one represents the other. The last step in this stage is the station of khitam where the individual is characterized by the essence (haqiqah) of the Real. This station is beyond the reach of ordinary mortals.

C. Jami

‘Abd al-Rahman Jami (817 - 898/1414 - 1492), a famous poet and great scholar, was the follower of ibn ‘Arabi. His book, Lawa’ih (Flashes), is an exposition of the doctrine of the unity of Being. In the preface he states that this doctrine is the result of mystic experience of several eminent saints, but his role is that of a mere interpreter, for he has not undergone or experienced any mystic trances. He has only put in words what others had experienced at first hand.¹⁰⁷

His statement of the theory follows the logical definition of the word “existence.” Existence (or Being) is sometimes used as a universal concept which in logic is called “secondary concept” (ma‘qul-i thaniyyah) and has no objective reality corresponding to it but which attaches itself to the quiddity (mahiyyah) of a thing mentally. Taking Being in this sense, several critics have raised an objection against ibn ‘Arabi’s state that God is the Absolute Being. According to them, abstract existence having no objective reality cannot be said to be the source of external reality. Jami, therefore, tries to defend ibn ‘Arabi by saying that Being or existence has another sense.

When pantheists use the word “Being” (wujud), they refer to reality which exists by itself, and on which depends the existence of other beings. As a matter of fact, none exists except He and all objective existents are His modes.¹⁰⁸ But the truth of this statement, according to Jami, is verifiable not so much through reason as through mystic experience and intuition. The Absolute Being is called God who is the source of all that exists and yet is above all multiplicity. He transcends all manifestations and is unknowable.

Essence, pure and simple, is completely without any determinations and is above the distinctions of names, attributes, and relations. It is only when this essence descends towards manifestation that attributes such as knowledge, light, and existence makes their appearance. The essence is

above all determinations but it is only when God is viewed by our human finite intellect that He is said to possess attributes.

Following ibn 'Arabi he rejects the Ash'arite theory of divine attributes according to which attributes subsist in and are co-eternal with God, and yet are neither identical with or different from Him. In "Flash" (La'ihah) 15, Jami explains that attributes are distinct from the essence in thought but are identical with it in fact and reality. God is knower due to the attribute of knowledge, powerful due to the attribute of power, active due to the attribute of willing, etc. There is no doubt that as these attributes are different from one another with regard to their content, they are similarly distinct from the essence. But in reality, they are all identical with the essence in the sense that in Him there is no plurality of existence.

The Ultimate Reality, i.e. God, is the ground of everything that exists. He is one so that multiplicity cannot affect Him. But when He reveals Himself in multiplicity of forms and modes, He appears to be many. These distinctions of one and many, however, are only subjective. God and the world are two aspects of the same reality. "The universe is the outward (expression) of God and God is the inner (reality) of the universe. Before manifestation the world God and God after manifestation is identical with the world." As a matter of fact, reality is one, and the dual aspects of God and the world are only our ways of looking at it.¹⁰⁹

The nature of things in the universe in relation to the Absolute is like modes which Jami, following 'Arabi, calls shu'un; they have no existence or reality in themselves and are mere adjectives of the One Being.¹¹⁰ These modes are included in the Absolute as qualities in here in a substance or as a consequent follows from its ground - as half, third, and fourth, and other fractions are related to the integer; these fractions are potentially included in the integer one and become explicit only when repeated.¹¹¹

It is clear that the theological sense is not the actualization of the hidden potentialities of the Creator, but the production of individuals and things which, through deriving their existence from this source, yet enjoy self-determination and independence to some extent. According to Jami, Creator and creatures are two aspects of the same reality.

This subjective determination, according to Jami, has two stages. In the first stage called martabah-i 'ilmi, these existents appear in divine knowledge in the form of archetypal ideas (a'yan-i thabitah). In the second stage called rank of the physical world (martabah-i 'ain), they acquire the attributes and properties of external existence. "In short, there is nothing in the external world except one reality which appears to be many on account of being clothed in diverse modes and attributes."¹¹²

As essence, the Real is beyond all knowledge; neither revelation nor reason can help anyone to comprehend it. No mystic saint can ever claim to experience Him as such. "His highest characteristic is the lack of all characterization and the end of all knowledge about Him is bewilderment."¹¹³ The first stage of the descent is ahadiyyah which is a bare unity devoid of all modes and relations. When it is conditioned by these modes, it is called al-wahdiyyah where the Real characterized by manifestation, etc. It is at this stage that he assumes the attributes of being

the Creator and Sustainer and is characterized by life, knowledge, and will. It is at this stage also that the existents first appear in the consciousness of God as the objects of His knowledge, but they do not involve multiplicity in the One.

At a later stage these objects of God's knowledge are clothed in existence and they assume multiplicity. They all exhibit in varying degrees some of the divine names and attributes.¹¹⁴ But in spite of all these manifestations and splitting of the One into multiplicity, the unity remains unimpaired. It causes no change in the essence or in its attributes. "Although the light of the sun illuminates at once the clean and the unclean, yet it does not affect the purity of its light."¹¹⁵

Though the one essence is interfused in all existents, its presence in them does not mean that everything is equal in this respect. There are differences of degree due to the power of receptivity of each thing. No doubt God and the world are two aspects of the Real, yet God is God and the world is the world. "Every grade of Being is determined according to its rank. If you ignore this distinction, you become an infidel."¹¹⁶

In ethics Jami follows the usual pantheistic tradition and advocates full-fledged determinism. As God is the essence of all things and is the inward aspect of the world, all actions that are usually ascribed to man should, as a matter of fact, be attributed to the Real. But if man is so determined, then how to account for the evil? Jami here again follows ibn 'Arabi. It is true, he says, that all actions of men are God's, yet it is not proper for us to attribute evil to God, for Being qua Being is absolute. According to him, therefore, evil has no positive content; it is privative content; it is privative, lacking something which should have been there. Take, for instance, the case of cold. There is nothing evil in it as such, but with reference to the fruits which it does not allow to ripen, it becomes evil.¹¹⁷

The ultimate goal of man should be not only fana', passing away of consciousness, but fana'-i, passing away of the consciousness of having attained the state of fana'. At this stage, an individual loses not only awareness of self but also awareness of this "non-awareness of self." Then, according to Jami, faith, religion, belief, or kashf (mystic knowledge and experience) all become meaningless.¹¹⁸

45. In a certain sense, he argues, a'yan al-thabitah can be called eternal. God is eternal and His knowledge must also be eternal. As objects of God's knowledge, a'yan al-thabitah must of necessity be eternal. And yet, he adds, in their essence, they are hadith. Because huduth is an actual existential fact (amr al-'aini) and qidam only a logical determination (amr al-hukmi), al-Jili prefers to call a'yan hadith rather than qadim. Al-Insan al-Kamil, p. 132

46. The verse is as follows: "He said to (the heavens) and to the earth, 'Come both, willingly or unwillingly.' They both said, 'We come willingly.'"

69. Ibid., pp. 260 - 61.

70. The terms "length" and breadth" were first used by Jallaj for lahut (divinity) and nasut (humanity) and later employed by ibn 'Arabi and al-Jili to denote the two aspects of the essence.

71. Al-Insan al-Kamil, pp. 253 - 54.

72. Ibid., p. 262.

73. 'Arsh, according to ibn 'Arabi and al-Jili, signifies universal body. "It is the theatre of majesty, the locus of tajalli and a characteristic of essence and is known as the place of that essence - a place which is devoid of all (spatial) reference." Ibid., pp. 171 - 72.

74. Kursi, the Footstool under the divine Throne, "signifies the tajalli of all (divine attributes of action. The divine activity in manifesting the realities of the universe looks first of all to kursi. At this stage the effects of contradictory attributes are manifested in detail and the Word of god (divine amr) comes into existences." Ibid., p.

75. Ibid., p. 262

76. 'Arsh, according to ibn 'Arabi and al-Jili, signifies universal body. "It is the theatre of majesty the locus of tajalli and a characteristic of essence, and is known as the place of that essence - a place which is devoid of all (spatial reference. Ibid., pp. 171 - 72.

77. Kursi, the Footstool under the divine Throne, "signifies the tajalli of all (difine) attributes of action. The divine activity in manifesting the realities of the universe looks first of all to kursi. At this stage the effects of contradictory attributes are manifested in detail and the Word of God (divine amr) comes into existence." Ibid., p. 173.

78. "The Exalted pen means the first individualization of the creatures analytically. First, the khalq is individualized in the divine consciousness generally and without differentiation, at the stage of 'arsh, its being is synthetic and logical; at the (third) stage of kursi, khalq is manifested analytically. At the (fourth) stage of the Pen, its existence is differentiated. In the first three stages, this manifestation (of khalq) was in the Unseen (i.e.

in God), while in the fourth stage, its manifestation is made objective.” Ibid., p. 174. See also p. 200, “The source of knowledge of the first intelligence and of the Exalted Pen is the same light. When it is referred to creatures, it is called the first intelligence, and when it is related to Haqq, its name is the Exalted pen.

79. Al-lauh al-mahfuz, according to al-Jili, stands for the universal soul. Ibid., p. 176.

80. Ibid., pp. 261 - 62.

81. Ibid., pp. 263 - 64. Cf. ibn ‘Arabi: “Only two beings rightly call themselves God: God Himself who in His books and the perfect man like Bayazid.” See Affifi, op. cit., p. 78.

82. Al-Insan al-Kamil, p. 93.

83. Ibid., p. 153. Al-Jili distinguishes between saint ship and prophethood as follows: “When Adam was sent down to the earth, he was made a prophet, for prophethood means legislation (tashr‘) and imposing obligation (taklif) which pertain to this earth. While in paradise Adam was a saint, nfor it is the place of miracles and observation and this is saint ship.” Ibid.. p. 308.

84. Reference is to the Qur’anic verse (17:1), “Glory be to Him who carried His servant (‘abdihi) by night from the Holy Mosque to the Remote Mosque.

85. Al-Insan al-Kamil, pp. 319 - 20.

86. Ibid., pp. 320 - 21.

87. Ibid., p. 144. The qualifying word “institutional” implies that prophet of the other is still possible and, thus, on p. 320 he explicitly says that nubuwwat al-wilayah will continue.

88. “Names and attributes form the nature of the heart.” Ibid., p. 193. he argues from the Qur’anic verse (95:4), “We indeed created man in the fairest mould.”

89. “From the first intelligence which is referred to as the Principle of Mohammad, God created Gabriel. Thus, Mohammad in this sense becomes the father of Gabriel and the source and ground of the whole universe. The First Intelligence is called al-Ruh al-Amin (the Truthful Spirit) because it is the storehouse of divine knowledge and its protector.” Ibid., p. 200.

90. Ibid., pp. 197 - 200.

91. Ibid., pp. 200 - 06.

92. Ibid., pp. 206 - 10.

93. Al-Jili relates that he himself was submerged in this path of speculative philosophy and this was due only the spiritual influence of his teacher, al-Jabarti, who was staying with a group of mystics in Zabid in 779/1377 at the house of one Shihab al-Din Ahmad. Ibid., pp. 212 - 13.

94. Ibid., pp. 210 - 14.

95. Ibid., pp. 292 - 93.

96. Ibid., pp. 272 - 73.

Chapter 44: Sheikh Ahmad Sirhindi

A. Life and Studies

Sheikh Ahmad Sirhindi, better known as Mujaddid Alf Thani, was the son of Sheikh ‘Abd al-Ahad Makhdum, who was a devout Muslim always anxious to derive spiritual enlightenment from saints. Sheikh ‘Abd al-Ahad Makhdum met Sheikh Allah Dad at Ruhtas and Sayyid ‘Ali Qawam at Juanput. He learned a great deal from both and then returned to Sirhind and lived there until his death in 1007/1598. A great master of all the branches of contemporary knowledge, he taught the prevalent textbooks on philosophy and religion to his students extensively. He was also an acknowledged authority on jurisprudence.

Besides, he taught mysticism to those who were eager to learn it, using ‘Awarif al-Ma‘arif and Fusus al-Hikam as his texts. He was an ardent reader of ibn ‘Arabi and was an authority on his teachings. He acknowledged ibn ‘Arabi’s superiority in philosophy and spiritual insight, but he never followed him if he found him deviating from the Sunnah. He was such an ardent and close follower of the Holy Prophet and his teachings that he never left a sunnah (tradition) unpracticed. He loved the devotees of Khuwaja Baha’ al-Din Naqshband of Bukhara called the Naqshbands,¹ and his son inherited this love and devotion to them from him.

Sheikh Ahmad was born in 971/1563 at Sirhind. His name was Ahmad and his surname was Badr al-Din. From his father’s side, he descended from the Caliph ‘Umar. In his early childhood he was sent to a school where in a short time he learned the Holy Qur’an by heart. Then for a long time he was taught by his father. Later he went to Sialkot and there covered some more courses under the guidance of Kamal Kashmiri. He also studied some works on Hadith from Ya‘qub Kashmiri, a great scholar of the time. By the young age of 17 he had mastered a great deal of Islamic sciences and had begun teaching them to others.

He visited Agra where he met some great men of learning including Abu al-Faidi. After some time he accompanied his father to Sirhind. On his way home, he was married to the daughter of a noble named Sheikh Sultan of Thanesar. On his return to Sirhind he stayed with his father and through his help established spiritual relationship with the Qadriyyah and Chishtiyyah schools of mysticism. Through the training received from his father, he learned the fundamentals of Sufism. In his studies too he had been greatly influenced by his father. He could not go on a pilgrimage to the Holy Land in his father’s life-time, although he yearned to do so. He was anxious to serve his father during his life and could not leave him alone.

After his father’s death in 1007/1598 he started on this long cherished pilgrimage. On his arrival at Delhi, he heard of the reputation of Khuwaja Baqi Billah as a saint from a friend, Maulana Hassan. He went to him promptly and was well received. The Khuwaja inquired of him about his intended pilgrimage and then wished him to stay with him for a week or so. He was greatly impressed by the spiritual attainments of the Khuwaja that he made up his mind to become his disciple. The Khuwaja was very fastidious in taking anyone as his disciple but he immediately accepted the Mujaddid as his follower and focused his entire attention upon him. The

Mujaddid's heart became the seat of the praise of Allah and he made rapid progress in spiritual knowledge. Under the Khuwaja's guidance he was able to complete his Naqshbandi training in a few months. He was warmly congratulated and was invested with a gown as a symbol of the completion of his training. He went back to Sirhind and began to teach people. After the Khuwaja's death he used to go to Delhi at the 'urs² of the late chief.

B. The Shari'ah

An important period of his life is that between 1028/1618 and 1032/1622. One year of this period was spent in the prison of Gwalior and the other three with the Emperor Jahangir and his army. His increasing popularity aroused the jealousy of his rivals who poisoned the ears of the Emperor and reported him to be dangerous both to the Emperor and the State. The Emperor had faith only in the ascetics and hermits. He could not tolerate a widely popular Sufi in his land. Perhaps Asaf Jah and some other nobles had a hand in this intrigue against the Mujaddid. The matter was worsened still by his refusal to bow before the Emperor on the ground that it was against the tenets of Islam, with the result that he was imprisoned at Gwalior. He was released a year later, but he had to stay for a further period of three years with the army as a detenu. Two years before his death he was allowed to go to his home at Sirhind. There he died on the morning of the 28th Safar 1034/10th December 1624.

Some hold that the Sheikh's release was due to the fact that the Emperor had at last become his disciple and had repented of his action of the previous year, but others hold that the above view was not borne by facts.

It was the crying need of the time that there should appear a man who might have the boldness to oppose the worship of the Emperor by refusing to bow before him, and, thus revive the true spirit of Islam and the extirpate heresy. He fearlessly faced the displeasure of an absolute monarch and chose to go into imprisonment rather than renounce his own beliefs and principles. He stood firm as a rock against the tide of the Mughul heresy introduced by the Emperor's father, Akbar the Great. He is called the Mujaddid because he started the movement of purifying Islam and restored its traditional orthodoxy. His courageous stand against anti-Islam practices resulted in a religious renaissance in India.

The method adopted by him to achieve his purpose was equally bold. He trained groups of disciples and sent them to all the Muslim countries and to the various cities of India to propagate what he regarded as the spirit of Islam. He especially asked them to make people realize the importance of the Sunnah and prepare them to counteract the forces of heresy and to observe and to make others observe the tenets of Islam. His letters to the great men of the Muslim world was given wide publicity. In them he discussed problems connected with Islam and its revival. He pressed the people to follow the Sunnah rigidly and to uproot heresy. He brought numerous noblemen and courtiers to his fold, and in this way tried to change the attitude of the Emperor and his Court.

The Mujaddid strictly adhered to religious practices and sanctioned by the Holy Prophet and was very hard upon those who coined excuses to

violate them. He was an authority of Fiqh and Tradition. His knowledge was encyclopedic and he was endowed with critical insight in matters of religion. His views on mystical revelation and illumination, pantheism, pre-destinarianism, sectarianism, and Sufism are very important. Sheikh Ahmad's reforms can be easily divided into three categories: (1) call to the Muslims to follow the Sunnah and discard heresy (bid'ah), (2) purification of Islamic mysticism (Sufism) from the practices and thoughts which had crept into it through non-Muslim influences and (3) great emphasis on the Islamic Law.

1. Heresy and the Mujaddid's Opposition to It

Heresy implies an innovation. The 'ulama' (theologians) had divided it into two categories, namely, the good innovation (bid'at-i hasnah) and the bad innovation (bid'at-i sayyi'ah). The Mujaddid says he can find no beauty, benefit or light in either. In many of his letters he is at pains to tell his correspondents that all heresy is reprehensible. He quotes many sayings of the Holy Prophet in denouncing it. He symbolizes every kind of heresy with dust, dirt, and pitch darkness and regards it as misleading. Those who practice heresy do so for lack of foresight and insight. The Holy Prophet said that heresy misleads people and uproots the Sunnah itself. When a heresy creeps into religion, it deprives the believers of traditional practice. He was of the opinion that Islam is complete in itself; heresy is a useless appendage of it.

Even if it appears right, it is in fact a blot on their fair face of Islam. Any approval of a heresy or disavowal of the completeness of Islam. In the course of time, the Sunnah would disappear, and heresy would prosper. Respect shown to an upholder of heresy is to deal a blow to Islam. Heresy is a cutting axe to religion and the Sunnah is a guiding star. To strengthen Islam heresy must be uprooted. "May it please the Lord," said he, "to show the 'ulama' that no heresy is good."

2. Reforms in Sufism and the Nature of Sufistic Perfection

"If the contemporary Sufis are just, they should not follow their leaders but the Sunnah. They should never uphold heresy on the pre-text that their Sheikhs did so."³ If a heresy appears in the guise of an inspiration, it is immediately accepted by the people as a long lost truth. For the long conversations and commentaries of the Sufis had been tending away from the religious law (Shari'ah) and a time came in the history of Sufism when the Sufis began to proclaim that Sufism and the religious Law were poles apart. They did not show the respect that the law deserves. They regarded it as formal and ineffective and, as a result, religion and its values suffered much at their hands, though very few knew the harm that was being done. This attitude of the Mujaddid elicited an unqualified praise from Iqbal for him. Speaking of him he says, "He was the guardian of the Muslim faith in India whom God had given a timely warning."

The Mujaddid said, "The Sheikhs who in their state of insensibility (sukr) praise infidelity and induce men to wear the Brahmanical thread⁴ are to be excused because they are not themselves. Those who follow them consciously in these matters are not to be excused because they do so while

they have their senses.”⁵ The rectitude of speculative knowledge depends on its being in concord with theology, and the smallest departure from it is insensibility. According to him, someone asked Khuwaja Naqshband to define the Sufistic institution. He replied that the ultimate end of Sufism is achieved when the rational knowledge becomes revelational or inspired, and the abstract becomes concrete. He did not say that we should seek something over and above the revealed law. The non-essentials that a Sufi meets on his way to Sufistic perfection lose their importance when he reaches his destination. The Law alone is then seen as real. The Prophet received it through a messenger but the Sufis get it by direct inspiration from God.⁶

The Caliph ‘Umar was highly incensed when he was told that Sheikh ‘Abd al-Kabir Yamani was of the view that Allah has no omniscience. He did not attribute this remark to the Sheikh’s insensibility or unconsciousness. He rather thought it to be an infidelity, even if it was committed by the Sheikh with a view to being denounced by the world,⁷ as public denunciation was considered by some Sufis to be contributive to Sufistic perfection. “The true aim of Sufistic institution is to attain sound faith, which depends upon spiritual tranquility without which salvation is impossible. When this tranquility is reached, the heart becomes unconscious of everything but God.”⁸

3. Significance of the Shari‘ah

The divine law is connected with the soul and the spiritualization of the soul depends upon obedience shown to it alone. The Sufi learns this after his perfection.⁹ While still on their way to Sufistic perfection, many Sufis flounder on this mysterious road. One should never lose sight of the divine Law whenever one’s beliefs and deeds are involved.¹⁰ The Naqshbandi Sheikhs have sub-ordinated revelation to the divine Law (Shari‘ah) and with them intuition and inspiration are subject to the divine decrees. Ecstasy should not be given priority to the divine Law. The Naqshbandis are never influenced by the senseless and exaggerated discourses of the Sufis. They never uphold ibn ‘Arabi’s fass¹¹ against the explicit verses of the Qur’an (nass).¹²

The light of God which is revealed on occasional flashes to others is to them constantly illuminating. Everything but His name is erased from their hearts, and even if they try for ages they can think of nothing but Him.¹³ The touchstone of the Sufistic revelations and intuitions should be the commentaries of the Sunnite theologians, for even the adherents to heresies and all those who go astray regard the Holy Qur’an and the Sunnah together as the fountainhead of their beliefs. They misinterpret them only because of their perverted mentalities.¹⁴ The Sufistic discourse which is congruous with the Sunnite interpretations is agreeable, while that which is otherwise is not. Upright Sufis never transgress the limits set by the divine Law even in their ecstatic discourses, dealings, and philosophies. Whenever a Sufi in his ecstasy or transport opposes the Law, his revelation is a mirage. It should be interpreted and explained correctly.¹⁵ Perfection comes through meek submission to God, which implies submission to His Law. This is the best of faiths in the eyes of the Lord.¹⁶

You can tell an imposter from a sincere believer by their respective attitude to the divine Law. A truly faithful Sufi never transgresses the Law in spite of his insensibility and ecstasy. Despite his claim, “I am the True One,” Mansur Hallaj used to offer five hundred rak‘at¹⁷ every morning in submission to God even while he was chained in a prison cell. It is as difficult for an imposter to observe the tenets of the Law as to remove the Mount Caucasus from its place.¹⁸

According to the Mujaddid, the only duty performed by the theologians (‘ulama’) is to issue decrees while it is the people of Allah (saints) who do the real work. An attempt at internal purification is to enable one to observe the divine tenets, one who is busy only in internal purification to the extent of neglecting the divine Law is an infidel and hence his revelations and intuitions are like those of an obstinate sinner. The way of uprightness is through divinity and the sign of the real internal purification is the sincere observation of and submission to the divine Law is an infidel and hence his revelations and intuitions are like those of an obstinate sinner.

The way of uprightness is through divinity and the sign of the real internal purification is the sincere observation of and submission to the divine Law. The restoration of the Sunnah and the obligatory prayers is the best of worships and will be rewarded in heaven.¹⁹ The Naqshbandi devotees dislike the mystical revelation that contradicts the Law and denounce the senseless wrangling of the Sufis. They do not like dancing and listening to music. They do not like loud recital of God’s name for He is supposed to be ever with them. With them guidance and discipline depend upon one’s submission to and acknowledgement of the prophetic institution; it has nothing to do with external trappings such as the cap or the genealogy of the Sheikh as is the case with the other sects.²⁰

C. Existential or Experiential Unity

C. Existential or Experiential Unity (wahdat al-Wujud or wahdat al-Shuhud)

In order to understand the rift somehow created between Islam and Sufism one must ponder over the philosophical aspect of pantheism. Pantheism was the real bane of Islam. The Mujaddid knew its fallacy and he was one of those who denounced it vehemently. He based his stand on the training he had received from his father and his Sheikh, Khuwaja Baqi Billah. The State of pantheism was revealed to him shortly after he had adopted the Naqshbandi way of approach to reality. He was anxious to understand the mysticism of ibn ‘Arabi. The light of God and of His attributes dawned upon him and this, according to ibn ‘Arabi is the ultimate end of Sufism.

For years he kept thinking that he had reached the state in which he had realized the ultimate, but all of a sudden this state vanished. Then he came to realize that union with God is only experiential and not existential; God is not and cannot be one with anything. God is God and the world is world. All that the Sunni theologians said in this respect was true. As the Mujaddid had loved pantheism much in the earlier stage of his life, he was rather uneasy at this change. Yet, with the new revelation, the veil was lifted and the reality appeared to him in its true form. This world is merely a mark of the

existence of its Creator, and it merely reflects the various attributes of the Lord. It does not consist of these attributes. A pseudo revelation, he thought, like erroneous deductions in religious matters, may not be denounced, but it must not be followed, lest others be misled.

With the followers of ibn ‘Arabi, pantheism is the final stage of Sufistic perfection, while in reality it is nothing but one of the states experienced by every devotee. After the devotees have passed this preliminary state, they walk on the right Path. Khwaja Naqshband says that all that is heard or seen or known is a veil. It must be negated with the word “none” (la). “I had accepted pantheism,” says the Mujaddid, “as it was revealed to me and not because I was directed to it by someone else. Now I denounce it because of the right revelation of my own which cannot be denied, although it is not compulsory for others to follow...”²¹ The presence of the One means that the Sufi sees nothing except the One. The pantheist acknowledges the presence of the One in everything and thinks all besides it as nothing, yet the very same non-entity is regarded by him as the incarnation of the One.

Pantheism is not at all essential, because sure knowledge is possible without it, and sure knowledge does not entail the denial of the existence of others. The sight of the One is in no way a denial of the existence of the others. The prophets never preached pantheism, nor did they ever call the pluralists infidels. They invited people to the oneness of Being. No prophet ever preached that creation is an incarnation of the Creator. Their aim was to inculcate faith in the One Lord who is unique and has no like.²²

D. Revelation and Intuition

Only the Qur’an and the Sunnah are to be trusted. The duty of the theologians is simply to interpret these fundamental sources and not to add anything to them. The mysticism of the Sufis and their revelations and inspirations are to be accepted only if they conform to them, otherwise they are to be rejected. The promise of God is to unveil Himself to His good people in the hereafter and not here. The revelations and “lights” of which the Sufis are so proud are nothing but their own mental projections and fantasies in order to console themselves.

The open sight of God is absolutely impossible to people in this world. “I am afraid the beginners would be discouraged if I were to point out the drawbacks of these revelations and ‘lights,’ but if I remain silent, the true and the false shall remain undistinguished. I insist that these ‘lights’ and revelations must be judged with reference to the revelation of God on the Mount of Sinai, when Prophet Moses prayed for the sight of Him. Who can bear the sight of Him?”²³

“Abundance of miracles is not the sign of a devotee’s spiritual superiority. A person who has no miracle to his credit may possibly be superior to others in certain respects. Sheikh Shaihab al-Din Suhrawardi says, “Miracles are a boon from God to render the faith firm, but the man who has been gifted with a firm faith does not require them; it is enough for him that his heart praises and remembers Him.”

Miracles can be divided into two categories. Those of the first category comprise the transcendental knowledge of God and His attributes. These are beyond the sphere of rational inquiry and are revealed only to a few of His

favourites. The second category is concerned with revelation about creation and information concerning this universe. Unlike the former, even imposters can have a share in the latter. The people having miracles of the first category have more chances to reach God than those having miracles of the second, but to the common man, the latter are more acceptable.”²⁴

Ibn ‘Arabi is reported to have said that some pious devotees were ashamed of their miracles at their death-beds. Why should they have been so if the miracles were the only true touch stone of a pious devotee’s superiority? Numerous saints are unaware of their position and status but as they are not prophets they do not need the awareness of their position. Sainly men can invite people to the religion of their prophet without miracles. Their real miracle is to purify the souls of their disciples. The soul being immaterial, they have to turn their attention away from materialism. These people even without miracles are the sureties of peace and prosperity in tis world.

The distinction between a true and a false devotee is that the former adheres strictly to the Law, and the latter adheres to his own whims. The man whose company inspires you to be more attentive to God is a true devotee.²⁵ Not even a prophet is safe from the evil designs of the devil. If a devotee is tempted by Satan he should judge his inspiration by its accord to the tenets of the religion of his prophet. If anywhere the divine Law is silent and the Satan’s “inspiration” cannot be proved right or wrong, the “inspiration” should be regarded as questionable. The divine tenets are silent in matters which are superficial, and, therefore, may neither be accepted nor rejected.

Sometimes, without any attempt on the part of the Satan to mislead us, we have false inspirations as in dreams. These false inspirations ar the creations of our own fancy.²⁶

E. The Religious Law

According to the Mujaddid, religious Law has three aspects: knowledge, actions, and fidelity. To acquire these aspects of the law it is necessary to win the pleasure of God which excels all blessings. Sufism and Gnosticism help in purifying one’s soul by completing the important aspect of infidelity. They have no end in view but this. Ecstasy, “intoxication,” and “illumination” are by-products of Sufism. They are not its ends. They are merely fantasies and projections in order to please the beginners. After passing these on his way, the Sufi has to surrender to the divine will, which is his real destination. One among thousands achieves pure fidelity. Blind men take the by-products for the principle articles and are, therefore, deprived of the truth. A Sufi has to experience these states before his acquisition of the truth.²⁷

The Mujaddid himself experienced these intermediate states for years, and ultimately achieved the goal of fidelity. Those who think the Law superficial and regard gnosis as the right Path are misled. They are content with the states, the means and ignore the end.²⁸ The straight Path is the path of the Holy Prophet whose guidance the best. Internal purification completes the external and is not contradictory to it. When we submit devoutly to God’s beloved, the Holy Prophet, we become His beloved.²⁹

Submission to the Prophet's tradition (Sunnah) is the real bliss, while opposition to it is the cause of all disasters. Hindu sadhus or ascetics undergo much privation but all in vain, for it is not in accordance with the true Law. The most that such ascetics can achieve is some material gain which is transitory. The devotees of the religion Law are like dealers in diamonds who work less but gain more.³⁰

On the completion of a Sufi's life, real pleasure is derived from the performance of obligatory prayers, while in the beginning non-obligatory prayers are more pleasant.³¹

The states of ecstasy, gnosis, and "illumination" are good if they are subservient to the law; otherwise, they are misleading. If not weighed in the balance of the Law, they are worthless.³²

The Sufistic conduct helps one to abide by the divine Law. It controls one's lower passions and undermines their influence. It is neither antagonistic nor equivalent to the religious Law. It is rather subservient to it.³³

Some people are punctilious in the observance of the form of Law, but they ignore its intrinsic truth and worth and regard salvation as their only aim. Some people achieve the truth but assert that they have achieved it through their own effort and not through the help of the divine Law and not of the spirit of it. Either group is ignorant of its intrinsic virtues and is deprived of the divine guidance. True theologians alone are heirs to the prophets.³⁴

Those who regard a saint (wali) superior to a prophet are senseless and are not fully aware of the attributes of prophethood which is superior to saint ship (wilayah) in all respects.³⁵

The Mujaddid was a great religious enthusiast. The movement that he started in religion is still continued by his followers in various parts of the Muslim world. His heritage is indispensable for a modern reconstruction of religious thought in Islam. He was a Sufi but he did not think of Sufism as the sole aim of life. For him it was merely a means to an end, the end being complete and unconditional adherence and fidelity to the Qur'an and the Sunnah. For an essentially just estimate of his teachings one must consider him with reference to his times. His books are a valuable record of his practice and thought. He gave us a treatise on Sufistic perfection, but the best of him is found in three volumes of letters. The total number of letters in all these volumes is 535. With some exceptions, these are arranged in their chronological order. Five of his letters have been lost. They prove beyond doubt that the encyclopedic knowledge he had, and make a pleasant and enlightening reading.

Part 4: The “Philosophers”

Chapter 45: Jalal al-Din Dawwani

Chapter 46: Ibn Khaldun

Chapter 47: The School of Ispahan

Chapter 48: Sadr al-Din Shirazi

Chapter 45: Jalal al-Din Dawwani

A. Life and Works

Mohammad bin As‘ad Jalal al-Din was born in 830/1427 at Dawwan in the district of Kazarun, of which his father was the Qadi. Having received early education from his father and then from Mahjwi al-Ari and Hassan bin Baqqal, he studied theology under Muhyi al-Din Ansari and Hammam al-Din at Shiraz, where he ultimately became professor at the Madrasat al-Aitam. In a short time he became famous for his knowledge and learning, attracting students from far and wide. It was in recognition of his literary and academic fame that he received admission into the Cour of Hassan Beg Khan Bahadur (Uzun Hassan), the then Turkish ruler of Mesopotamia and Persia. He ultimately rose to the eminent position of the Qadi of the Court, which position he retained under Sultan Mantiq Ya‘qub as well. He died in 907/1501 or 908/1502, and he was buried in his native village Dawwan.¹

Tusi revived the tradition of philosophical disciplines during the Mongol period; Dawwani did the same during the Ottoman period. Whereas the former gave a fresh impetus to the study of ibn Sina by writing commentaries on some of his works and by defending him against his detractors, the latter on his Hayakil-i Nur and elaborating his illuminative philosophy (hikmat-i ishruq) in his own works. Both are revivalists, but they differ in their approach to the truth. The one is a true Avicennian, the other a faithful Suhrawardian. Brockelman has enumerated 70 of his extant works,² of which the important ones are listed below:

1. Sharh ‘Aqa’id-i ‘Adudiyah, Istanbul, 1817.
2. Sharh Tahdhib al-Mantiq wa al-Kalam, 1264/1847.
3. Al-Zaura, Cairo, 1326-1908.
4. Risalah fi Ithbat al-Wajib al-Qadimah wa-al-Jadidah.
5. Risalah fi Tahqiq Nafs al-Amr.
6. Risalah fi Ithbat al-Joauhar al-Mufariq.
7. Risalah fi ‘Adalah.
8. Risalah fi-Hikmah.
9. Sharh al-Hayakil.
10. Anmudhaj al-‘Ulum.
11. Al-Masa’il al-‘Asr fi al-Kalam.
12. Akhlaq-i Jalali, translated into English under the title of The Practical Philosophy of the Mohammadan People, by W.F. Thomson, London, 1839.

B. Ethics

Dawwani was commissioned by Sultan Hassan Geg to revise the ethical treatise of Tusi with the express aim of “correcting and completing” it from the illuminative (ishraqi) point of view. The structure of Akhlaq-i Jalali is basically the same as that of Akhlaq-i Nasiri, but in the execution of the work Dawwani has artistically ornamented it with the Qur’anic verses, precepts of the Prophet and his Companions and the moving utterances of the mystics. He not only abbreviated and simplified Tusi’s treatise but also amplified and elaborated it at places in the light of the philosophy of illumination; besides he added much by way of literary adornment.

Following ibn Miskawaih, Tusi regards ultimate happiness (sa'adat-i quswa) as the summum bonum of life. His concept of ultimate happiness because of its reference to the heavenly (qudsi) element is intrinsically different from the Aristotelian concept of happiness. Dawwani goes a step further and identifies the moral with the religious ideal. It is with reference to God intended vicegerency that the Qur'an distinguishes right from wrong, evaluates knowledge and appreciates power; therefore, vicegerency of God (khilafat-i ilahi) and not ultimate happiness should be the inspiring ideal of the "noblest position of man in the universe as determined by God and not by man himself, which is that of the vicegerency of God.

What entitles man to this high office of responsibility? Dawwani finds the answer in a saying of the Caliph 'Ali. Man, according to this saying, occupies a middle position between the angels and the brutes. The former have intellect without desire and ire. They have no temptations, nor freedom of choice; being perfect by nature, they are above morality. The latter, on the other hand, have desire and ire without intellect, and thus, being incapable of controlling their irrational impulses, are below morality. Man has both.

He can, however, rise above the angels by sub-ordinating desire and ire to intellect, and can also sink below the brutes if desire and ire enslave his intellect. The brutes can be excused for want of intellect, but not man. The excellence of man's perfection is enhanced by his natural temptation and deliberate resistance to evil; the angels have been spared the painful processes of conflict, deliberation, and choice. Thus, man alone is a free, responsible and, therefore, moral being, and his right to the vicegerency of God is established on this very ground.³

How is this vicegerency to be accomplished by man? Quoting the Qur'anic verse, "Whosoever gains wisdom, verily he gains great good." Dawwani holds that mature wisdom (kikmat-i balighah) is the royal road to this exalted position. By mature wisdom, being a happy blend of theory and practice is essentially different from the Socratic dictum: Knowledge is virtue. The Greeks were interested in ascertaining the speculative principles of morals; the practical aspect of ethics was quite alien to their temperament.

Mature wisdom can be acquired through intellectual insight as well as through mystic intuition. Both the philosopher and the mystic reach the same goal through different ways. What the former "knows," the latter "sees," there being complete harmony between the findings of the two.

Influenced by the Qur'anic doctrine of moderation⁴ no less than the Aristotelian doctrine of the mean, Dawwani holds that the mean constitutes the good in all matters. But it is determined not by "reason" and "prudence," as held by Aristotle, but by the divine Law. Reason can at best determine the form of morality, the content whereof must come from the divine Code. Since the path of moderation is difficult to tread, Dawwani has identified it with the bridge over hell (pul sirat) - a bridge which is narrower than a hair and sharper than a sword.

Moral struggle pre-supposes that all dispositions (khulq), whether innate or acquired, are capable of modification and change. Constant instruction

and discipline and punishment, as evidenced by experience, can change the wicked into the virtuous. By these means the evil is greatly reduced, if not completely eradicated. And since a person does not know beforehand that a particular evil disposition would resist all attempts to modify and change it, it is in consonance with the dictates of both reason and religion that he should exert his utmost for its modification.

To Plato, virtue was the moderation of human nature as a whole. Aristotle assigned to each virtue the place moderation would give it. Be he could go no further than this. The Greeks “systematized, generalized, and theorized,” but the accumulation of positive knowledge based on patient, detailed, and prolonged observation was altogether “alien to their temperament.” This weakness of the Greek genius was removed by a rather practical and penetrating mind of the Muslims,⁵ who classified ethics as a “part of practical philosophy.” With ibn Miskawaih, the first Muslim moralist, the emphasis shifted from broad generalizations to individual differentiation and specification of virtues. He not only determined seven, 11, 12 and 19 species⁶ of wisdom, courage, temperance, and justice respectively - the four cardinal virtues of Plato - but also developed an attractive theory of the causes and cures of mental diseases, a process which culminated in al-Ghazālī with a shift from an intellectual to a mystic outlook.⁷

Ibn Miskawaih had worked out the details of Plato’s theory of virtue, but with Tusi the problem was that of improving and completing the Aristotelian theory of vice. He emphasized for the first time that deviation from the equipoise is not only quantitative but also qualitative, and, thus, added perversion (rada’at) as the third generic cause of vice⁸ to the Aristotelian excess and deficiency of a state. Tusi also set the seal of completion on practical philosophy by including domestics and politics in his ethical treatise in order to meet the deficiencies of the ethical work of ibn Sina (Kitab al-Taharat) and of that of Farabi. Lastly, Tusi revolted against the ascetic ethics of al-Ghazālī. Asceticism, for him, is the negation of moral life, for man is by nature a social being as is indicated by the word for man in Arabic, insan (associating), and body is not an obstacle but an instrument of the soul for attaining the perfection it is capable of.⁹

Nevertheless, he recognizes asceticism as a necessary stage in the development of mystic consciousness, of which he has had no personal experience. Inspired by the illuminative philosophy of Shihab al-Din Maqtul, Dawwani finds complete harmony between philosophy and mysticism. What the mystic “sees,” the philosopher “knows,” and the latter “knows,” the former “sees.” He, therefore, gave a Qur’anic bias to the ethics of Tusi.

C. Politics

Following Tusi, Dawwani too has used Siyasat-i Mudun more in the sense of the science of civics than in the modern sense of politics. The origin, function, and classes of society and the need of a government headed by a just king are the same for Dawwani as for Tusi. Monarch is held to be the ideal form of government, in which king is the second arbitrator of justice, the first being the divine Law. After reproducing the general

principles of distributive and corrective justice from Akhlaq-i Nasiri, Dawwani adds ten moral principles of his own, which ought to be observed by a king in order to ensure efficient administration of justice.

In the first place, the king should invariably consider himself to be the aggrieved party while deciding a case, so that he may not wish for the aggrieved what is abhorrent to him. Secondly, he should see that the cases are disposed of quickly, for justice delayed is justice denied. Thirdly, he should not indulge in sensual and physical pleasures which ultimately bring about the ruin of a State in their wake. Fourthly, royal decision should be based on clemency and condescension rather than on rashness and wrath. Fifthly, in pleasing people he should seek the pleasure he should seek the pleasure of God. Sixthly, he should not seek the pleasure of the people by displeasing God. Seventhly, he should render justice if decision is left to his discretion, but forgiveness is better than justice if mercy is begged of him. Eighthly, he should associate with the righteous and lend ears to their counsels. Ninthly, he should keep everyone to his rightful place and should not entrust high office to the low-born people. Lastly, he should not be content with personal abstention from injustice, but should conduct the affairs of the State that none under his authority is guilty of this offence.

D. Metaphysics

Like Tusi and others, Dawwani's cosmology consists of the gradual emanation of ten intellects, nine spheres, four elements and three kingdoms of nature. The active intellect, the intellect of the sphere of the moon, bridges the gap between the heaven and the earth.

Quoting the Prophet's saying that intellect is the noblest of all the created things, Dawwani identifies the first intellect ('aql-i awal) with the original essence of Mohammad. It conceives the idea of all things past, present, and future, just as a seed potentially contains roots, branches, leaves, and fruit. The spheres which are stationary in nature, but changeable in qualities, control the destiny of the material world. Fresh situations come into being through the revolutions of the spheres, and every moment the active intellect causes a new form into existence to reflect itself in the mirror of elemental matter. Passing through the mineral, vegetative and animal states, the first intellect finally appears in the form of acquired intellect (aql-i mustafad) in man, and, thus, the highest point having coalesced with the lowest, the circle of being is completed by the two arcs of ascent and descent.

The first intellect is like the seed which sprouted into twigs, branches, and fruit, reverts to its original form of unity possessing collective potentiality. This circular process takes the form of motion (harkat-i wada'i), in growing bodies of increasing or decreasing their magnitude, and in the rational soul that of the movement of thought. All these motions are, in fact, shadows of the divine motion proceeding from God's love for self-expression, which in mystic terminology is called the flashing of Self upon Self.¹⁰

Dawwani's metaphysical treatise, al-Zaura is a critical evaluation of Kalam and of the teachings of the spiritual leaders, the philosophers, and the mystics, from the illuminative (ishraqi) point of view. He fully appreciates the utility and importance of the first three disciplines but takes serious

notice of the inconsistency with Islam of some of the issues raised by them. He believes that philosophy and mysticism both ultimately lead to the same goal, yet he cannot shut his eyes to the eminence and superiority of the latter over the former. Mysticism, in his view, is free from doubt and uncertainty because it is due to divine grace and is, therefore, nearer to prophethood.¹¹

Chapter 46: Ibn Khaldun

A

Ibn Khaldun wrote no major work in fields accepted in the Muslim philosophic tradition or which he considered to be the proper fields of philosophic investigation - logic, mathematics, physics, and metaphysics - politics, ethics, and economics.¹ Consequently, he was not regarded by his contemporaries, or by subsequent Muslim students of philosophy, as a philosopher (failssuf) in the sense in which al-Farabi, ibn Sina, and ibn Rusd were identified as such. Nevertheless, both his contemporaries and later Muslim students of history and society were aware that ibn Khaldun had made the most significant contribution to these specialized fields through his undertaking a scientific investigation of them.

It was, however, the enhanced interest in the study of history and society in modern times which led to the devotion of increased attention of ibn Khaldun's thought, to the recognition of his rank as a major Muslim thinker, and to the judgment that he was equal, if not superior, to the other well-known Muslim philosophers. This was in part the result of the higher prestige, and of the peculiar theoretical importance, which history and the sciences of society (as compared to the theoretical part of traditional philosophy) have come to enjoy in modern times.

But the more important reason for the singular interest in ibn Khaldun in modern times lies in the conclusions of his investigations in history and society. To the moderns, these conclusions appear to be more scientific than either the conclusions of the legal investigation of Muslim jurists or the politico-philosophic investigations of Muslim philosophers. Perhaps on the analogy of the revolt of modern science against traditional philosophy, and especially of modern political philosophy and social science against traditional political philosophy, it has been assumed that ibn Khaldun must have attempted a similar, or parallel, revolt against traditional Muslim philosophy in general, and against traditional Muslim political philosophy in particular.

Because of its important implications for the understanding of ibn Khaldun's thought, this crucial assumption deserves critical examination. The larger context of the present work seems to warrant an inquiry into the precise relationship between ibn Khaldun's new science and the Muslim philosophic tradition. This relationship has been for the most part viewed in the perspective, and under the influence, of the modern philosophic and scientific tradition. In the present work, in contrast, the reader comes to ibn Khaldun through the preceding Greek and Muslim philosophic tradition, which ibn Khaldun knew and in relation to which he can be expected to have taken his bearing.

The reader, thus, must be shown, on the basis of ibn Khaldun's conception of philosophy and science, and of his conception of the relation between his new science and the established philosophic science, whether he was in fundamental agreement with that tradition (in which case it must be shown what the specific character of his contribution to that tradition was), a new, but a novel doctrine.

That this procedure is the sound historical procedure is usually admitted. But what has not been seen with sufficient clarity is that, in addition to providing the proper historical perspective for the understanding of ibn Khaldun's thought, it is of fundamental importance to elicit the basic principles or premises of his new science, and thus contribute to the understanding of its true character.

B

Ibn Khaldun's place in the history of Muslim philosophy, and his contribution to the Muslim philosophic tradition, must be determined primarily on the basis of the "Introduction" (Muqaddimah) and Book One of his "History" (Kitab al-'Ibar).² That a work exploring the art of history, and largely devoted to an account of universal history,³ should concern itself with philosophy is justified by ibn Khaldun on the ground that history has a dual character: (a) an external (zahir) aspect which is essentially an account of, or information about, past events, and (b) an internal (batin) aspect. With respect to this latter aspect, history "is contemplation (theory: nazar) and verification (tahqiq), a precise causal explanation of things generated (ka'inat) and their origins (or principles: mabadi), and a profound science ('ilm) of the qualities and causes of events; therefore, it is a firm principle part (asl) of wisdom (hikmah), and deserves, and is well fitted, to be counted among its sciences."⁴

Whatever ibn Khaldun's position concerning the relation between wisdom and philosophy may have been (ibn Rushd, who was the last of the major Muslim Philosophers whom ibn Khaldun studied, considered that the two had become identical in his own time),⁵ he frequently uses the expressions "wise men" (hukama') and "philosophers" (Falasifah) interchangeably, and it is certain that he identifies the sciences of wisdom with the philosophic sciences.⁶ Furthermore, in his classification and exposition of the various sciences, he defines the basic characteristics of these sciences, enumerates them, and makes ample reference to the Greek and Muslim authors, who represent the specific philosophic tradition which he accepts as the tradition.

Ibn Khaldun's definition of the philosophic sciences is based on an emphatic and clear-cut distinction, if not total opposition, between the sciences which are natural to man as a rational being (therefore, he names them also "natural" [tabi'iyah] and "rational" or "intellectual" ['aqliyyah] sciences)⁷ and the legal, transmitted, or positive sciences based on the divine law, which are the special property of a particular religious community. In contrast, the philosophic sciences are "those which a human being can understand by (virtue of) the nature of his thought and the subjects, the problems, the ways of demonstration, and the modes of teaching to which he is guided by perception, until his contemplation and investigation lead him to understand the true from the false in as far as he is a human being possessing thought."⁸

The philosophic sciences are classified into four fundamental sciences or groups of sciences: logic, mathematics, physics, and metaphysics or the divine science.⁹ This is followed by a concise history of these sciences (especially among the ancient Persians, the Greeks and the Muslims) which

emphasizes (a) the relation between the rise and development of these sciences, and cultural development and prosperity, and their decline subsequent to cultural disintegration, and (b) the anti-philosophic attitude of the divine laws and religious communities, which led (especially in cases where sovereigns adopted this attitude, or religious orthodoxy was able to determine the type of learning pursued in the community) to deserting the philosophic sciences.¹⁰

The philosophic sciences reaching the Muslims were those of the Greeks.¹¹ Of the Greek philosophic schools ibn Khaldun mentions specifically those of Socrates, Plato, and Aristotle, and also the commentators of Aristotle, i.e. Alexander of Aphrodisias, Themistius, and others. Aristotle is singled out as “the most well-grounded of them in these sciences.”¹² Muslims recovered these sciences from the disuse to which they had fallen among the Byzantines, and after a period of searching for, acquiring, and translating the works preserved among the latter, Muslim scholars studied these Greek philosophic sciences, became skilled in their various branches, reached the highest level of proficiency in them, and surpassed some of their predecessors.

Although they differed with Aristotle on many issues, they generally recognized him as the foremost teacher (Mu'allim-i Awwal). Of Muslim philosophers, ibn Khaldun mentions by name al-Farabi, ibn Sina, ibn Bajjah, and ibn Rushd. He indicates the decline of the philosophic sciences in Western Islam after the disintegration of cultural life in that region, and refers to reports concerning the then flourishing state of these sciences in Persia and eastward, and their revival and spread in Western Europe.¹³

Thus, there seems to be little doubt that when ibn Khaldun says that the study of the internal aspect of history is to be made one of the sciences of wisdom, he does not simply mean that it deserves a systematic, rational, and scientific study in general. What he means is much more specific and precise. The study of the internal aspect of history, if it is to be properly scientific, must be recognized as a significant part of, and is to be pursued as belonging to, one of the philosophic sciences or one of a group of the philosophic sciences (of the Socratic school)¹⁴ epitomized in the works of Aristotle and also in those of the Muslim philosophers who belonged to that school and concentrated primarily on the exposition of the works of Aristotle.

C

To which of these sciences or groups of sciences does the investigation of the internal aspect of history belong? To answer this question, a fuller statement of the character and principles of this investigation is needed. Ibn Khaldun first formulates what this investigation is to comprise, and how it is to be conducted through a critique of Islamic historiography and the examination of the causes of the errors of historians in the “Introduction,” in which he illustrates the distinction between the external and internal aspects of history and establishes that these errors are primarily due to the ignorance of the nature and causes of historical events, both in so far as these are permanent and homogeneous as well as in so far as they change and are heterogeneous

Then, in the first part of the introduction to Book One, the true character of history is said to be identical with “information about human association, which is the culture (‘umran) of the world, and the states which occur to the nature of that culture...(and) all that is engendered in that culture by the nature of (these) states.”¹⁵ The primary cause of errors in transmitting historical information (and, consequently, in writing an untrue account of history), thus, becomes ignorance of the nature of the states of culture.

The states of culture and what is engendered in them is considered to form a part of all engendered things, whether essences or acts, each of which inevitably has a nature specific to its essence and to its accidental states. “What the historian needs for examining historical reports, and for distinguishing the true from the false, is knowledge “of the matters of engendered [existents] and the states in existents”¹⁶ so as to be able to examine and determine the possibility or impossibility of the occurrence of the events themselves. Thus, the basic principles (i.e. the subject-matter, problems, method, and end) of a new investigation emerge, and are finally formulated as follows:

“The rule for distinguishing truth from falsehood in the [investigation of historical] information on the grounds of possibility and impossibility is for us to contemplate human association, which is culture, and to distinguish the states pertaining to its essence and required by its nature, what is accidental and need not be reckoned with, and what cannot possibly occur in it. If we do that, it would be for us a rule in distinguishing truth from falsehood in [historical] information, and veracity from lying, in a demonstrative manner admitting of no doubt. Then, if we hear about some states taking place in culture, we shall know scientifically what we should judge as acceptable and what we should judge as spurious. This will be for us a sound criterion by which historians will pursue the path of veracity and correctness in what they transmit. This is the purpose of this First Book of our work. It is, as it were, a science independent by itself. For it has a subject (namely, human culture and human association) and has [its own] problems (i.e. explaining the states that pertain to its essence one after the other).”¹⁷

We then have a seemingly independent science the subject of which is human association or culture, the problems of which are the essential states of culture, the method is that of strict demonstration, and the end is that it be used as a rule to distinguish the true and the veracious from the false and the spurious in historical reports. To which philosophic science or group of sciences does this science belong, and in what way could it be characterized as a firm and principal part of philosophy?

That it does not belong to the logical or the mathematical sciences needs little argument. Logic is defined by ibn Khaldun as “the science which makes the mind immune to error in seizing upon unknown problems [or questions] through matters already realized and known. Its advantage is in distinguishing error from correctness in the essential and accidental concept and judgments, which he who contemplates aims at in order that he may understand the verification of truth in generated [things], negatively and positively.”¹⁸ Logic is an organon of thought and a propaedeutical science making rules used in the contemplation of all generated things, and in

ascertaining the sound definitions of their essences and accidents. Since the subject and problems of the science of culture are said to belong to generated things, it will have to use the rules devised by the logical arts, but it is not itself concerned with the problems of how to achieve sound abstractions or how to distinguish them from those unsound.

It is only necessary to add here, first, that ibn Khaldun accepted, without reservation, Aristotelian logic as found in the logical writings of Aristotle (with the addition of Porphyry's *Isagoge*) and the commentaries of al-Farabi, ibn Sina, and ibn Rushd. Thus, logic for him deals with the mental forms abstracted from things and useful in the knowledge of the essences and the "truths" of things. Its central aim is demonstration or "the syllogism producing certainty," and "the identity of the definition and [the thing] defined," i.e., the subjects dealt with in the *Posterior Analytics* or "The Book of Demonstration."¹⁹ Ibn Khaldun doubts the validity of the attempts of Muslim dialectical theologians (*Mutakallimun*) who concentrate on purely formal syllogism and forgo the fruits of the works of the ancients in the field of material logic.²⁰

Secondly, ibn Khaldun repeatedly emphasizes that the science of culture must be a demonstrative science in the sense specified here, to the exclusion of dialectical, rhetorical, and poetic arguments which are based on commonly known and commonly accepted premises rather than on self-evident, necessary, and essential premises, or premises that are the conclusions of syllogisms based on such premises, as required by posterioristic logic.

As to the mathematical sciences, they are concerned with measurements or quantities, either theoretically, such as the study of pure numbers, or practically as applied arts. In the latter case, they are useful in the study of culture, since they acquaint us with the mathematical properties of things, such as the stars, which exercise an influence on culture, and form the bases of many of the crafts which are an important aspect of cultural life.²¹ But although the science of culture makes use of the conclusions of the mathematical sciences and is concerned with quantity as one of the categories of all generated things, its subject is not quantity as such, but the nature and causes of a specific generated thing which is culture.

This leaves us with natural sciences and metaphysics, or the sciences of natural and divine existents. Since the study of generated things, their natures, their states, and all that is engendered in them,²² is the specific subject of natural science or natural philosophy, the new science of that specific generated thing which is culture seems to form a part of natural philosophy and to belong to it by virtue of its subject. This statement must now be amplified by giving answers to: (a) why does the new science of culture deserve to be a natural science and counted among the natural sciences, and (b) how does ibn Khaldun establish it as a firm and principal part of natural philosophy?²³

D

Natural science is defined by ibn Khaldun as follows:

"Then [after logic], the contemplation among them [i.e. the philosophers] turns to: [a] the sensible, viz bodies of the elements, and those generated

from them (viz minerals, plants and animals), celestial bodies, and natural motions, or the soul from which motions emerge, etc. This art is named “natural science,” and it is the second of these (philosophic) sciences. Or [b] the contemplation turns to the matters that are beyond nature.”²⁴

This is explained further in the second and more elaborate definition supplied by ibn Khaldun in his own way:

“[Natural science] is the science which inquires about the body with respect to what adheres to it, viz. motion and rest. Thus, it contemplates the heavenly and elemental bodies, and what is begotten from them (man, animals, plants, and minerals), what is generated inside the earth (spring, earthquakes), in the atmosphere (clouds, vapours, thunder, lightning, and thunderbolts), etc, and the principle of motion in bodies, i.e. the soul in its various species in man, animals, and plants.”²⁵

Then he mentions the standard works on natural science. The physical parts of the Aristotelian corpus, which have been followed, explained, and commented on by Muslim authors, the most well-known and reliable of these being ibn Sina in the corresponding parts of three major works (Shifa’, Najat and Isharat), and ibn Rushd in his summaries of, and commentaries on, Aristotle’s works on physical sciences, with the difference that ibn Sina seems to disagree with Aristotle on many problems of natural science, while ibn Rushd remains in close agreement with him.²⁶

These statements point to a conception of the character and scope of natural science, and the order of its parts, which is not ibn Khaldun’s own, but one which was elaborated by ibn Sina and ibn Rushd on the basis of a tradition initiated in Muslim philosophy by al-Farabi, and which has a firm foundation in Aristotle’s own writings on nature. Following the scheme suggested by Aristotle, e.g. in the opening chapter of Meteorology,²⁷ these philosophers included within natural science or natural philosophy the works beginning with the Physics and ending with the De Anima and the Parva Naturalia, and arranged their objects, order, and rank, as follows: (1) the general or first principles of all natural existents or of all that is constituted by nature, or “the first causes of nature and all natural motion” (Physics), (2) the simple or primary parts of the world, or “the stars ordered in the motion of the heavens” (On the Heaven and the World), (3) the motion of the natural elements, or their generation and corruption, alteration and growth (On Generation and Corruption), and (4) the accidents and affections common to the elements (Meteorology).

Then follows the study of particular existents that are generated and corrupted: (5) the minerals which are the simplest and closest to the elements (On Minerals), (6) plants (On Plants), (7) animals (The Parts of Animals, etc.), and (8) the general principles of the soul and its parts (On the Soul), followed by the particular powers of the soul and the accidents existing in plants and animals by virtue of their possessing soul (Parva Naturalia).²⁸

According to this scheme, the science of the soul, which is the form of animal and plant bodies, falls within the scope of the science of nature, and the science of the intellect, which is one of the faculties of the soul, falls to the connection of nature to soul, and of soul to intellect, and the study of

these connections certainly did not mean, nor did it lead to, the reduction of one to the other. For the scheme was not merely a deductive one by which the more complex is deduced from the more simple or the particular from the general, but a methodological plan of investigation beginning with the general and simple and leading to the particular and complex, recognizing their substantial heterogeneity, and using observation, enumeration, and induction, to a greater extent than, and in conjunction with, syllogistic reasoning.

Furthermore, the study of soul and intellect leads the investigator to matters that are beyond nature, and that could no more be, strictly speaking, considered within the scope of a natural investigation, but in this case, these matters cannot claim the advantages enjoyed by natural investigation which are solidly based on human experience and perception. One could then perhaps speak with ibn Rushd of the possibility of delimiting the investigation of soul and intellect to what corresponds most to the manner of investigation conducted, and, thus, arrives at explanations similar in character to those given by natural science - taking this to be more fitting to the purpose of Aristotle.²⁹

But to grant the difficulties raised by this scheme does not alter the fact that both for Aristotle and the Muslim philosophers mentioned above, the inclusion of the study of soul and intellect within the general science of nature is legitimate. Consequently, the study of man and of all that concerns man is considered an integral part of the study of nature or of natural science. This does not hold true only for his body in so far as it shares common properties with all natural bodies, for the properties of generation and corruption which he shares with all composite things, and for the faculties of his soul which he shares with plants and other animals, but also for his specific differentiae as a rational being: his sociability and his association with others and co-operation with them in the development of the arts, his appetites and desires, his purposeful, organized social activity, his practical and theoretical intellect, and his ability to comprehend things through visions, dreams, and prophecy, and to use what he comprehends in ordering his political life. All such matters are dealt with in the science of the soul.³⁰

Human association or culture, as ibn Khaldun conceived it, is a natural property of man as a rational being. He intended to investigate its modes or states, the various accidents that occur in it, and its generation and corruption; and to develop this investigation into a full-fledged inquiry or science. Since the basis of man's sociability, and its primary manifestations, can legitimately fall within the scope of natural science, the elaboration of this natural property of man, and the investigation of the various aspects of social organization to which it leads man, can also legitimately belong to natural science and be counted as one of the natural sciences.

Whether the new science will in fact prove well-fitted to be considered a natural science, will of course depend on whether it will remain loyal to the method of investigation followed in the natural sciences. Ibn Khaldun was aware of the fact that the subject he intended to investigate had been studied in contexts other than natural science, notably in the Muslim legal sciences

and in the practical philosophic sciences. Thus, even if he had insisted on a science of human association or culture which had to be a part of philosophy or wisdom, he could have chosen to study it as a practical science.

The reason for not choosing this alternative will be discussed in a subsequent chapter.³¹ It is sufficient in the present context to insist that what he sought was a natural science of human association. He examined the works of Plato and Aristotle, and of Muslim thinkers, and found³² that they had not elaborated such a science before. Thus he set out to make good this deficiency in the natural sciences. But if he is to succeed in his effort, he must show unequivocally that the new science is indeed being firmly established on the foundation of natural philosophy.

E

The “History” was originally divided by ibn Khaldun into an “Introduction” (Muqaddiman) and three Books. The “Introduction” deals with the problem of history in general, Book One contains the new science of culture, Book Two contains the history of the Arabs and other peoples (except the Berbers) down to ibn Khaldun’s own time, and Book Three contains the history of the Berbers in Western Islam.³³

Muqaddimah is a technical term meaning “premise.” It can be generally defined as that upon which what follows depends and which does not itself depend upon that which follows.³⁴ It can be a general discussion or explanation introducing a subject, a book, or a science, the emphasis here being upon what needs to precede these rather than that upon which they strictly depend. In this sense the “Introduction” precedes the three Books and is a useful discussion clarifying the problems that are to follow. But this “Introduction” together with Book One came also be known as the Muqaddimahi, as an introduction to the last two books, or the historical account proper. This is a usage which is closer to the technical definition of the word, since, as ibn Khaldun explains, the writing of a correct historical account depends upon a prior understanding the science of culture.

The proper technical definition of muqaddimah, however, which is the specific definition used by logicians in the study of syllogism, induction, and analogy, is “that upon which the soundness of the proof depends, without an intermediary” or “a proposition made a part of syllogism or an argument.”³⁵ Such a premise should be veracious and properly related to the question or problem. It is of two kinds: (a) definitive (such as being primary, based on observation or experience, or on multiple authoritative reports, or being the conclusion of a syllogism based on such premises and (b) based on opinion (generally known or accepted notions, etc.)³⁶

These can be made the premises of a single syllogism or argument, or of a whole science. In this latter case, they are named the “premise(s) of the science” and are defined as those upon which the setting out upon the science depends, and upon which its problems depend.³⁷ Apart from the general usages mentioned above, ibn Khaldun uses muqaddimah in this specific “logical” sense,³⁸ and the first section of Book One, which treats “human culture in general,” is made up of six such premises. Since the new science “depends” upon the character of these premises, we must examine them in detail.

1. Association is Necessary for Man

Ibn Khaldun presents this premise or proposition as being the same as what the wise men express when they say that “man is ‘political’ by nature, i.e., he cannot dispense with association, which in their technical usage is the ‘polis’, and this is the meaning of culture.”³⁹ It is significant, however, that ibn Khaldun substitutes, here at the outset, “necessary” for “by nature” and his explanation of the first premise indicates that this substitution was deliberate on his part. For, the way he grounds the need for association in human nature is by explaining that, while the “animal nature” of human beings are the same as those of the rest of the animals (in that like them they cannot exist except through nourishment and self-defence), they are inferior to some animals in that the ability of a single human being cannot possibly be equal to meeting his needs for nourishment and self-defence.

Therefore, man associates with others and develops the arts and tools, and the social organizations, necessary for nourishing and defending himself, not because his specifically “human nature” is essentially superior to the rest of the animals, or because he needs these arts and tools and organization to satisfy his specifically human needs, but because his natural constitution is deficient for conducting a solitary life, and because without associating with others he remains helpless and unable even to exist.⁴⁰

Thus, ibn Khaldun, while purporting simply to “explain” what the philosophers meant by “man is political by nature,” in fact concentrates on those traits of man’s animal nature which render association a necessary condition for the very life and continued existence of man. Nevertheless, he emphasizes that this premise and its explanation as he presents them are also based on the conclusions of the investigation of animal and human natures conducted by the philosophers and confirmed by the investigation of the organs of the human body conducted by Galen - more specifically, that the “demonstration” of this premise was presented by the philosophers⁴¹ referring to the appropriate passages of *De Anima* and the commentaries of them.⁴²

On the surface, ibn Khaldun’s only object is to the attempt of the philosophers to “add” a rational proof of prophecy to their demonstration of the political nature of man, while in fact he seems also to object to the widening of the scope of the proposition in such a manner as to state that association is necessary for man’s well-being in addition to its being necessary to his existence. What he seems to indicate is that the study of human nature within the scope of natural science cannot demonstrate this proposition in this wider sense; therefore the science of culture must restrict itself to accepting the proposition in its narrower sense, susceptible to demonstration within natural science, only. In other words, according to him, the study of culture should be a sociological one without ethical extensions.

2. Distribution of Culture on Earth

This premise simply recounts what has already been explained by the wise men who have contemplated the states of the world relative to the shape of the earth, the generation of animals and of human species, and the inhabited parts of the earth; it is a summary of the geography of the seven

zones and the information available concerning the conditions prevailing in each.⁴³ Here, ibn Khaldun restates the various conclusions demonstrated in such parts of natural philosophy as the investigation of the nature of elements of generation and corruption, of minerals, and of localities of animals,⁴⁴ and completes them through such information as has been supplied by observation and authenticated multiple reports found in the works of astronomers, and, in particular, in the works of Greek and Muslim geographers like Ptolemy, al-Mus'udi, and al-Idrisi.⁴⁵ It is also in these works that the word 'umran, which ibn Khaldun used as a technical term indicating the subject of his new science, is most frequently encountered.

3. Temperate and Intemperate Zones and the Influence of the Atmosphere upon the Colour of Human Beings and many of their States

This premise is again based on the investigation of the nature of generated beings, and the nature of heat and cold and their influence upon the atmosphere and the animals generated in it, proving that the colour of human beings and many of their arts and modes of life are caused by atmospheric conditions.⁴⁶ The only specific authority he invokes here is ibn Sina's rajaz poem on medicine.⁴⁷ He refutes the errors of genealogists which he attributes to their inattention to the natural basis of such matters as colours and other characteristic traits.⁴⁸

Throughout, the emphasis is upon the natural (in contrast to the specifically human or the divine) basis of culture as a whole, for in addition to relatively, elementary things (such as colour and other bodily traits, and the manner of preparing food and housing), ibn Khaldun indicates the dependence of even the highly complex aspects of culture (such as the sciences, political authority, and whether there are prophets, religions, and divine Laws) upon the nature of the elements and their effects upon the atmosphere.⁴⁹

4. Influence of the Atmosphere upon the Habits of Character (akhlaq) of Human Beings

Ibn Khaldun indicates that the valid causal explanation of this premise has been established in the proper place in philosophy where gladness and sadness are explained as the expansion and contraction of the animal spirit, and are related to the more general premise establishing the effect of heat in expanding the air.⁵⁰ This completely natural explanation, founded on the properties of the elements, is made the basis of mirth, excitability, levity, etc. In contrast, the opinion of al-Mas'udi (copying Galen and al-Kindi), which attributes these habits of characters to the weakness or power of the brain, is considered inconclusive and undemonstrated.⁵¹

5. Effects of the Abundance and Scarcity of Food upon the Bodies and Habits of Character of Human Beings

The causal explanation of this premise is based on the investigation of the quantity of food and the moisture it contains in the various localities of animals, their action in expanding and contracting, and in increasing and decreasing the moisture of the stomachs of all animals, including human beings, and the effect of this upon the coarseness or delicacy of bodies, and

upon the habits of character of human beings, including their piety and religion.⁵² This natural causal explanation is based on experience and confirmed by the students of agriculture.⁵³

6. Classes of those who perceive the “Unseen” (ghaib) among Human Beings by Natural Disposition or by Exercise

6. Classes of those who perceive the “Unseen” (ghaib) among Human Beings by Natural Disposition or by Exercise⁵⁴

This premise is introduced in a discussion on prophecy and dream-vision which deals with (1) practical guidance as the aim of prophecy, and (2) the signs of prophetic mission: (a) the psychological state at the time of revelation, (b) good character prior to embarking upon the prophetic mission, (c) the call to religion and worship, (d) noble and pedigree, and (e) marvels and miracles. The difference between the dialectical theologians and the philosophers concerning how marvels and miracles take place through the power of God or through the power of the prophet himself. The philosophers assert the latter on the basis that “the prophetic soul, among them, has essential properties from which these invasions (of nature) (khawariq) emanate through his (i.e. the prophet’s) power and the obedience of the elements to him in this generation (of these invasions of nature).”⁵⁵

As distinct from this introduction, ibn Khaldun presents his own statement (qual) in which he sets down “the interpretation of the true meaning (haqiqah) of prophecy as explained by men of verification (muhaqqiqun),” and mentions the real meaning of soothsaying, dream-vision, etc. The verified interpretation which ibn Khaldun adopts as the basis for his explanation of the true meaning of these phenomena proves to be a summary recapitulation of the entire subject of natural science, i.e., the observable world (‘alam) and the observable effects of unseen powers, sensible bodies, the elements, the spheres, the generable (minerals, plants, and animals ending in man), and the human soul and its powers.

These powers are again arranged in an ascending order: (1) the active powers, (2) the apprehensive powers which include (a) external senses, (b) internal senses, i.e. (i) common sense, (ii) imagination, (iii) estimation, (iv) memory, and (v) the power of thought which the philosophers call the rational calculative (natiqah) power.

“They all ascend to the power of thought (intellect) the instrument of which is the middle hollow of the brain. It is the power by which take place the movement of deliberation and the turn toward intellection, the soul is moved by it (i.e. this power) constantly through the longing instituted in it (i.e. the soul) towards that (intellection), to deliver (itself) from the abyss of potency and preparedness which belongs to human (nature) and to come out into act in its intellection (with which) it makes itself like the Heavenly Spiritual Host and comes at the lowest rank of the Spiritualities when it apprehends without bodily instruments. Thus, it moves constantly and turns toward that (intellection).

It may pass over altogether from human (nature) and its form of spirituality to the angelic (nature) of the upper region, not by (any) acquiring (of something from outside), but by the original and primary natural disposition toward it which God has placed in it.”⁵⁶ On the basis of the

structure and nature of the observable world, and the structure and nature of the human soul, and on the basis of the natural powers inherent in the latter, ibn Khaldun proceeds to classify and explain the various types of the activity of the soul in relation to the unseen world.

Thus, ibn Khaldun's own explanation of the foundation and the true meaning of these phenomena can be seen to be indeed based on the explanations of the natural world, and of the nature and powers of the human soul, as presented by "most" philosophers. Like them, he considers all such activities to be grounded throughout in the natural properties of the human soul which, in turn is closely related to the human body and the world of generation, of the elements, of sensible bodies, and of their motion and rest.⁵⁷ All other explanations are the "guesses and conjectures" of those who are not well grounded in these matters or who accept them from those who are not such, and are "not based on demonstration or verification."⁵⁸

F

These, then, are the premises, and the only premises, of ibn Khaldun's new science of culture. Even a superficial examination of them reveals that they are all conclusions of inquiries undertaken by other sciences which are all natural sciences. The new science of culture, therefore, does not make a clear, a first, or a true beginning; it is not a pre-suppositionless science. It pre-supposes not only all the natural sciences that have provided it with premises, but also the validity of their principles, the soundness of their procedures and explanations, and the veracity of their judgments and conclusions.

The inquiry into the place of ibn Khaldun's new science of culture within the Muslim philosophic tradition thus indicates beyond reasonable doubt that (a) ibn Khaldun conceived of the new science as a philosophic science, and that by philosophy he understood the sciences originated by the Socratic school, and elaborated by Aristotle and his Muslim followers, (b) the new science falls within the general scope of traditional natural science or natural philosophy, and (c) more especially, all of its premises are drawn exclusively from the various natural sciences, and, thus, it is indeed firmly grounded in these sciences because it pre-supposes their conclusions, and builds itself on the firm foundation.

Ibn Khaldun's science of culture was conceived by him as a contribution to the established philosophic sciences within a limited field. The grounds for this science, or its basic premises, were already established by traditional natural science or natural philosophy. No philosopher before him had used these premises to develop a science of human association or culture based exclusively on them. The Greek and Muslim philosophers, with whose works on practical philosophy ibn Khaldun was acquainted, invariably found it necessary to proceed by utilizing other premises which could not claim the same solidity and demonstrable character as the premises provided by natural philosophy. Therefore, the understanding of the specific character of ibn Khaldun's contribution requires an examination of the relation between his new science of culture and traditional Greek and Muslim political philosophy. This will be attempted in Chapter 49 of this work.

Bibliography

The following list contains ibn Khaldun's surviving works (cf. above, n. 1). For a more detailed bibliography of editions, translations, and studies, cf. Walter J. Fischel, "Selected Bibliography" in F. Rosenthal's translation cited below, Vol. 3, pp. 485 - 512.

Kitab al-'Ibar (The History), ed. Nasr al-Hurini, 7 vols., Bulaq, 1284/1867; Muqaddimat Ibn Khaldun (Prolegomenes d'Ebn-Khaldoun), ed. E. M. Quatremere ("Notice et extraits des manuscrits de la Bibliotheque du Roi et autres bibliotheques, publies par l'Institut Imperial de France," t. 16 - 18, premieres parties; also "Tirage a part des..."), Paris, 1858. The three volumes correspond to the Bulaq ed., vol. 1; The Muqaddiman: An Introduction of History, English tr. by Franz Rosenthal (Bollingen Series 43), 3 vols., Pantheon, New York, 1958; Les prolegomenes d'Ibn Khaldoun, French tr. by M. de Slane, 3 vols., Librairie Orientaliste Paul Geuthner, Paris, 1934 - 38; al-Ta'rij bi ibn Khaldun wa Rihlatuhu Gharban wa Sharqan (Auto-biography), ed. Mohammad ibn Tawit al-Tanju (Athar ibn Khaldun, vol. 1), Lajnah al-Talif, Cairo, 1370/1951; Lubab al-Muhassal fi Usul al-Din (Extracts from Fakh al-Din al-Razi's Muhassal), ed. P. Luciano Rubio, Editori Marroqui, Tetuan, 1952; Shafa' al-Sa'il li Tahsil al-Masa'il (Answers to Questions on Mysticism), MS No. 24299B, Dar al-Kutub, Cairo, edition in preparation by Tanji.

Notes

1. The summaries of "many" of the works of ibn Rushd, which he wrote as a young man (reported by ibn al-Khatib, cf. al-Maqqari, Nafh al-Tib, ed. Mohammad Muhyi al-Din 'Abd al-Hamid [10 vols., Cairo, al-Maktabat al-Tijariyyah, 1367/1947, vol. 8, p. 286]), may prove of value in corroborating the philosophic notions found in the "History." Ibn Khaldun himself did not evidently consider them of permanent value; they have not as yet been recovered and it is not known whether they have survived at all.

2. The Introduction and Book One are known together as the "Introduction" (Muqaddimah), cf. below p. 898. References in this chapter and in that on ibn Khaldun's Political Philosophy (cf. below, Book 4, part 6, Chap 49) are to the volumes, pages (and lines) of the Quatremere edition (Q) together with the corrections and/or additions supplied by the de Slane and F. Rosenthal in their respective French and English translations, both of which reproduce the pagination of the Quatremere edition on the margin. Cf. the Bibliography at the end of this chapter.

3. Cf. the account of the parts of the 'Ibar, below, p. 898.

4. Q 1, 2: 17 - 19.

5. Or that philosophic questions (i.e., the quest for wisdom) have become scientific logoi. Therefore ibn Rushd omits the well-known opinions and dialectical arguments found in Aristotle's works and does not enumerate the views current in his own time as Aristotle did, "because wisdom in his (Aristotle's) time had not become complete, and contained opinions of groups who were believed to be wise. But now that wisdom had become complete, and there being in our time no groups (merely) believed to be wise...the contemplation of these sciences must according to the mode in which mathematics is contemplated today. For this identical reason we must omit from them also the dialectical arguments." Ibn Rushd, Talkhis al-Sama' al-Tabi'i ("Paraphrase of the Physics"), MS. Cairo, Dar al-Kutub, Hikmah, No. 5, fol. 1 of Ahmad Fu'ad al-Ahwani, Talkhis Kitab al-Nafs (Paraphrase du "De Anima"), (Cairo, Imprimerie Misr, 1950), Introduction, p. 16; Kitab al-Sama' al-Tabi'i, (Hyderabad, Dairatul-Maarif, 1365/1945) pp. 2 - 3.

6. Cf., eg. Q. 2, 385:5, 3, 87:3 - 4 (where both wisdom and philosophy are used together in naming these sciences), 210.

7. Q. 2, 385, 3, 86 - 87.

8. Q. 2, 385:5 - 9.

9. There are three schemes according to which these sciences are enumerated. The four sciences or groups of sciences mentioned here appear in all of them. The order is that of the central scheme which divides the philosophic sciences into seven (mathematics, being subdivided into arithmetic, geometry, astronomy, and music) (Q. 3, 88:12 - 19). This scheme seems to emphasize the order in which, according to ibn Khaldun himself, these sciences follow one another. Consider the characterization of logic as that which comes first (muqaddam) - (note also the use of muqaddimah as "principle" or premise") - and of mathematics as "coming after" logic (ba'dahu). In the first scheme (logic, natural science [or] metaphysics, and mathematics), the order seems to be in accordance with the contemplation of these sciences as pursued among them ('indahum), i.e. among the philosophers (Q. 3, 87 - 88). The third scheme (mathematics, logic) gives a summary exposition of these sciences "one by one" (Q. 3, 88:19 - 20, 93ff.).

10. Q. 3, 88 - 92.

11. Cf. Q. 1, 62 - 63.

12. Q. 3, 90:14.

13. Q. 3, 90 - 93.

14. For the distinction among the various Greek philosophic schools (which had equally distinct groups of followers in Muslim philosophy), and of their different attitudes to divine Laws, cf. al-Shahrastani, *al-Milal w-al-Nihal*, ed. Ahmad Fahmi Mohammad, three volumes, Cairo, Maktabat al-Hussein al-Tijariyyah, 1367 - 68/1647 - 48, vol. 2, pp. 104 - 07, 231ff.

15. Q. 1, 56:6 - 13.

16. Q. 1, 57 - 58.

17. Q. 1, 61:7 - 19.

18. Q. 3, 87:5 - 9.

19. Q. 3, 108 - 12.

20. Q. 3, 112 - 16.

21. Cf. Q. 3, 87 - 88, 93 - 108.

22. Cf. above p. 893

23. See above, p. 890.

24. Q. 3, 87:9 - 15.

25. Q. 3, 116:12 - 17.

26.

Q. 3, 116 - 17. This judgment is based on ibn Sina's own statements and the accusations levelled against him by ibn Rushd.

Chapter 47: The School of Ispahan

A. Introduction

It is one of the most curious aspects of the Western study of Muslim intellectual life that with one or two exceptions practically no serious research has ever been made into the spiritual and intellectual treasures of 12 Imam Shi'ism in any of the European Languages.¹ As a result, not only Westerners but even the Muslims whose contact with the Shi'ah world is mainly through Western sources have remained totally ignorant of the remarkable intellectual life which has persisted to this very day in the centres of Shi'ism, especially in Persia. Inasmuch as it was mostly in the Shi'ah world that much of the intellectual life of Islam, especially in the sciences and traditional wisdom (Hikmat),² took refuge after the seventh/13th century this ignorance has helped to strengthen the totally erroneous notion that Islam fell into complete decadence after the Mongol invasion.

Just as a closer study of the Muslim world at large will show that in art, government, Sufism and many other aspects of Muslim life there was anything but decadence until fairly recently, a study of the Shi'ah world will reveal that even in the sciences, philosophy, and gnosis the Muslims have, with one gap of a century and a half, continued to flourish up to the present century. It will reveal that just as Safawid art is one of the high points of Muslim art, so the intellectual life of Shi'ism in this period one of the apogees of Muslim history, producing sages like Sadr al-Din Shirazi, usually known as Mulla Sadra.

Perhaps one day histories of philosophy will not have chapters on Islam which end abruptly with ibn Rushd or possibly ibn Khaldun but will trace the chain to the present century and end once and for all the dangerous illusion that the present day Muslims are separated from their own tradition by centuries of Safawid Persia, where 12 Imam Shi'ism became for the first time a completely independent political and cultural entity, an entity which has dominated every phase of life in Persia ever since.

The coming to power of the Safawids in Persia is one of the most fascinating chapters of Muslim history and marks one of the instances in which the influence of Sufism upon the social and political life of Islam is felt directly. Beginning as a Sufi brotherhood which traced its lineage as well as its name to the great saint Sheikh Safi al-Din Ardibili,³ the Safawids soon developed into a well organized political unity for the first time since the fall of the Sassanid Empire.

The Sufi order continued under the spiritual direction of a series of descendants of Sheikh Safi, and its members in the ninth/15th century adopted a 12-sided red hat for which they became known as the qizil-bash (red heads). The order grew in power in the politically disorganized Persia of the ninth/15th century and under Isma'il (892/1487 - 930/1523 - 24) succeeded in defeating the local rulers and unifying the whole of Persia.

Shah Isma'il was crowned in Tabriz in 905/1499 marking the beginning of the reign of the Safawids which was to last over two centuries until in 1133/1720 the Afghans conquered Persia, sacked the Safawid capital at Ispahan and killed Shah Hussein, the last of the Safawid rulers. During this

wavering between these two orthodox perspectives of the Islamic revelation, became completely 12-Imam Shi'ah and Shi'ism, which had until now remained a minority creed, found itself as the official religio of an empire and had to face political and social issues it had never been forced to face before.⁴

No longer molested by an external force and face with a large number of practical social problems, Shi'ah theology, Kalam, which had always served as the walls of the citadel of the faith,⁵ lost much of its earlier vigour while jurisprudence, Fiqh, having to face new situations, became highly developed. More important for our purpose is the fact that the predominantly Shi'ah culture of Persia prepared the background for the flourishing of the doctrines of israqi gnosis (illuministic wisdom),⁶ philosophy, and the sciences. The efforts of the chain of sages after Khuwaja Nasir al-Din Tusi, who had kept the study of these subjects alive suddenly found the necessary environment for the development of this form of wisdom.⁷

We have connected this wisdom symbolically with the school of Ispahan, which spread throughout Safawid Persia as well as in Iraq, Syria, and India with which the Persians had very close contacts. The centres of its life were not only Ispahan, the Safawid capital, but also other cities like Shiraz, Kashan, Qazwin, and Tabriz. Furthermore, some of the most important figures like Sheikh Baha' al-Din Amili, and Sayyid Ni'matullah Jaza'iri, who played a vital role in the establishment of Shi'ism in Persia, were Arabs from Amil near Damascus and Bahrain, two centres which had been preserving the Shi'ah tradition for centuries.⁸

The Shi'ahs have developed the Ja'fari School of Law named after the sixth Imam, Imam Ja'far al-Sadiq, as well as theology (Kalam) and other traditional studies, namely, language, history, hadith and commentary upon the Qur'an, jurisprudence (Fiqh), principles of jurisprudence (Usul),⁹ theology,¹⁰ and Hikmat, this last being a combination of gnosis, theosophy, and philosophy which forms the main subject of our present study.

B. Hikmat

The form of wisdom which has survived until today in the Shi'ah world as Hikmat can neither be wholly identified with philosophy as currently understood in the West, not with theosophy which has unfortunately become identified in the English speaking world with pseudo-spiritualist movements, nor with theology.¹¹ As developed in the Safawid period and continued to the present day, Hikmat consists of several threads knit together by the matrix of Shi'ism.

The most important of these elements are the esoteric teachings of the Imams, especially as contained in the Nahj al-Balaghah by the first Imam 'Ali, the ishraqi wisdom of Suhrawardi which contains in itself aspects of ancient Persian and Hermetic doctrines, the teachings of the earlier Sufis, especially the gnostic doctrines of ibn 'Arabi, and the heritage of the Greek philosophers. It is, therefore, not too surprising if many of the treatises on Hikmat begin with logic and end with ecstasy experienced in the catharsis (tajrid) and illumination of the intellect. They contain as a necessary basis some preparation in logic which they share with the Peripatetics

(Masha'iyun), but instead of remaining bound to the plane of reason they use this logic as a springboard for their flight into the heaven of gnosis.

The group of sages who between the death of ibn Rushd, the so-called terminating point of Muslim philosophy, and the Safawids prepared the ground for the intellectual revival of the school of Ispahan are usually not much better known outside Persia than the Safawid sages themselves. They include a series of philosophers and scientists like Khuwaja Nasir al-Din Tusi, better known in the Western world as a scientist than a philosopher and theologian, Qutb al-Din Razi, Mir Sayyid Sharif Jurjani, Jalal al-Din Dawwani, and ibn Turkah Ispahani,¹² all of whom sought to reconstruct Muslim intellectual life through a gnostic interpretation of the writings of ibn Sina, Suhrawardi, and the Sufis, and who carried further the attempt already begun by al-Farabi, extended by ibn Sina in his Qur'anic commentaries, and carried a step further by Suhrawardi, to correlate faith (iman) with philosophy.¹³

The precursors of the Safawid sages include also a series of pure gnostics, both Shi'ah and Sunni, although this distinction is not essential in Sufism, who spread the doctrines of ibn 'Arabi, the Andalusian sage and the formulator of gnostic doctrines in Islam in the Eastern lands of Islam.¹⁴ These Sufis include Sadr al-Din Qunawi, Fakhr al-Din 'Iraqi, 'Abd al Razzaq Kashani, 'Ala al-Daulah Simnani,¹⁵ 'Abd al-Rahman Jami,¹⁶ and two others who are especially important in introducing the gnostic doctrines of ibn 'Arabi into the Shi'ah world, ibn Abi Jumhur and Mulla Haidar 'Ali Amuli.¹⁷ One must also mention another great spiritual leader, Maulana Jalal al-Din Rumi, whose influence has extended throughout Persia during the past seven centuries.

C. Major Figures of the School of Ispahan

To write down even the mere names and works of all the important authors of the Safawid period would in itself require a book because in nearly every field of religious science many notable figures arose during this period of great intellectual activity. In theology, jurisprudence, and related sciences it is enough to mention only a few names like that of Zain al-Din ibn 'Ali ibn Ahmad Jaba'i (911/1505 - 966/1558), commonly known as the second martyr (shahid-i thani) because of his having been put to death by the Ottomans, the author of numerous treatise which still form a part of Shi'ah religious education, 'Ali ibn 'Abd al-'Ali 'Amili known as Muhaqqia-i Karaki (d. 945/1538), the author of al-Najmiyyah in theology and many other treatises and commentaries, the two Majlisis, Mohammad Taqi (1003/1594 - 1070/1659), the author of Raudat al-Muttaqin, and his son Mohammad Baqir (1037/1628 -1110/1699), the greatest of the Safawid theologians and scholars to whom we shall turn later.¹⁸

As for the hukama', those who cultivated this particular form of wisdom which they called Hikmat, they include Sadr al-Din Shirazi, better known as Mulla Sadra, to whom a separate chapter has been devoted in the present work, Sayyid Ahmad 'Alawi, Mir. Damad's Sabziwari (d. 1090/1669), the commentator of the Isharat and the metaphysics of the Shifa', and the Dhakhirat al-Ma'afi, Rajab 'Ali Tabrizi (d. 1080?/1670), a thinker with nominalist tendencies and the author of Risaleh-i Ithbat-i Wujud, 'Abd al-

Razzaq Lahiji (d. 1071/1661), a student of Mulla Sadra and author of some of the most important books on Hikmat in Persian like the Guhar Murad, Sarmayeh-i Iman, and the Mashariq al-Ilham, glosses upon the commentary of Khuwaja Nasir al-Din Tusi upon the Isharat, and the commentary upon Suhrawardi's Hayakil al-Nur, and Qadi Sa'id Qumi (1049/1640 - 1103?/1692), a gnostic and theologian, the author of the Ara'inat, Kilid-i Bihisht, and a commentary upon the Athulujiyya attributed to Aristotle but now known to be a paraphrasis of the Enneads of Plotinus.

In addition to these authors, there are a few other major figures about whom we have chosen to speak somewhat more fully hoping that in this way we can depict the various aspects of the intellectual life of the Safawid period. These figures include Sheikh Baha' al-Din Amili, Mir Damad,¹⁹ perhaps the central figure in the school of Ispahan, Mir Abu al-Qasim Findiriski, Mulla Musin Fa'id Kashi, and the second Majlisi whom we have already mentioned.

If space had allowed, we would have also considered the purely Sufi writings like the commentary upon the Gulsham-i Raz by Mohammad Lahiji, which is one of the best books on Sufism in Persian, and the works by the masters of other Sufi orders like the Tuhfih'- by the Dhahabi sheikh, Sheikh Mu'adhdhin Khurasani.

Sheikh Baha' al-Din 'Amili

The most colourful figure of the Safawid period was without doubt Baha' al-Din 'Amili, better known as Sheikh-i Baha'i.²⁰ His father was the leader of the Shi'ah community of 'Amil and a student of Shahid-i Thani. After his teacher's death in 966/1559, he set out with his son towards Persia. Baha' al-Din, who was born in Baalbek in 953/1546, was then only 13 years old and well qualified to master the Persian language. In Persia he continued his studies in the religious sciences, poetry, and Hikmat and soon became the leading scholar of his day and the Sheikh al-Islam of Ispahan. Despite his nearness to the Court and necessary participation in the worldly life he was a gnostic and spent many of the last years of his life travelling with the dervishes and visiting various Sufi masters. He finally passed away in 1030/1622 while returning from Hajj.²¹

Sheikh Baha' al-Din was the leading theologian and jurist of his time and the leader of the 'ulama' of Ispahan. He was at the same time an outstanding Sufi, one of the best of the Safawid poets who revived the 'Iraqi style and wrote poetry in the tradition of Rumi and Hafiz, the leading architect of the Safawid period, whose masterpieces like the Shah mosque of Ispahan still stand among the summits of Muslim architecture,²² and the greatest mathematician and astronomer of his period.

In an age when the theologians, jurists, Hakims, natural historians, sophists, logicians, and Sufis were well-marked groups, sometimes in external conflict with one another, Sheikh-i Baha'i was respected by all these groups, from the wondering dervishes, the qalandars, to the Court 'ulama' each of which considered the Sheikh its own. His genius lay precisely in showing the nothingness of all sciences before divine gnosis, while at the same time having a mastery of each science. Yet each of

Sheikh-i Baha'i's writings has become a standard source of reference in its own field.

Some of his important works include Jami'i-i 'Abbasi on theology in Persian, Fawa'id al-Samadiyyan on Arabic grammar which is still in wide use, a treatise on algebra, the Khulasah fi al-Hisab,²³ several treatises on astronomy including the Tashrih al-Aflak, a treatise on the astrolabe, 'Urwat al-Wathqa, general Qur'anic commentaries, many works on various aspects of the Hari'ah, the Kashkul, a collection of Arabic and Persian writings which ranks among the most famous Sufi works, and a series of mathnawis like Bread and Sweet, Cat and Mouse, Milk and Sugar, and the Tuti-Nameh.²⁴

It is especially in the didactic poems, the mathnawas, that the particular genius of Sheikh-i Baha'i for expressing sublime truth in simple language and in witty anecdotes becomes manifest. In these poems his spirit is very similar to that of Maulana Jalal al-Din Rumi whom he follows in spirit as well as in form. In the long poem of The Cat and the Mouse in which the cat symbolizes exoteric and formal knowledge and the mouse esotericism, the theme is the danger of hypocrisy which the exoteric view always faces and the necessity in the religious and social structure for exoteric knowledge. Sheikh-i Baha'i also emphasizes throughout the work the supremacy of intellectual intuition over discursive knowledge. As an example we mention below the story of Mu'tazilite and a Sufi who appears in the guise of a madman named Buhlul.

During the reign of one of the Caliphs, a Mu'tazilite was chosen as the Imam of the mosque. One day Buhlul entered the mosque with a brick hidden under his dress and joined the congregation after the prayers to listen to the Imam's sermon. The Imam in the Mu'tazilite fashion mentioned that Satan is not harmed in hell because he is made of fire and since a thing cannot harm its own kind, the fire of hell cannot harm him. Upon hearing this, Buhlul became infuriated but held back his anger.

The Imam continued his sermon by saying that both good and evil are by divine consent. Again Buhlul became angry but once again succeeded in remaining quiet. The Imam added that on the Day of Judgment man would actually be able to see God. Upon hearing this, Buhlul took out the brick from under his dress, threw it at the Imam injuring his head and ran away. The Caliph raging with fury was about to call for Buhlul when he walked into the palace and without any greetings sat at the head of the Court. The Caliph asked him with great anger as to why he had attacked the Imam. Buhlul answered by pleading to the Caliph to give him permission to explain how by his act he had done nothing discourteous and when given permission addressed the bleeding Imam and said that since according to his own words a thing cannot harm its own kind, a brick cannot harm the Imam's head since both are made of clay.

Furthermore, he asked the Imam if he had felt any pain upon being hit on the head and if he could see the pain. Upon receiving the reply that Imam did not see the pain, Buhlul asked how a man could be unable to see pain, a creation of God, see the Creator. Finally, Buhlul added that since all acts are done through divine consent, God must have given consent to his throwing

the brick and so the Imam should not complain of an act to which God had consented. Upon hearing this, the Imam, the symbol of rationalism, had to remain silent before Buhlul, the symbol of intellectual intuition.²⁵

The writings of Sheikh-i Baha'i are also replete with passages about the nothingness of all human knowledge as against divine gnosis. For example, in the poem Nan wa Halwah (Bread and Sweet) he says:

Formal science is nothing but altercation,
It results in neither intoxication²⁶ nor contemplation.
It continually brings congelation to man's nature,
What's more, the Maulana²⁷ does not believe in it.
If someone tells thee that of thy life,
There remains with certainty but a week,
Thou in this one week will busy thy self
With which science, oh accomplished man!
There is no science but the science of love,²⁸
The rest is the deception of the wretched Satan.
There is no science but the Qur'anic commentary and Hadith,
The rest is the deception of the perverse Satan.
The mysteries will never become known to thee,
If thou hast for student a hundred Fakhr-i Razi.²⁹
All who do not love the face of the beautiful
The saddle and the rein are appropriate for them³⁰
That is, he who does not have love for the Friend,
Bring for him the saddle and the headstall.³¹
He who has not fallen in love with his beautiful Face,
Erase his name from the tablet of humanity.
A breast that is empty of the love of the Beautiful,
Is an old leather bag full of bones.
A breast if devoid of the Beloved,
Is not a breast but an old chest.
A heart which is empty of the love of that Beauty,
Count it as a stone with which the Devil cleans himself.
These sciences, these forms and imaginings,
Are the excrements of Satan upon that stone.
If thou allowest other than the science of love in thy heart,
Thou wilt be giving Satan the stone to clean himself.
Be ashamed of thyself, oh villain,
That thou carriest the Devil's cleaning stone in thy pocket.
Wash the tablet of the heart from the Devil's excrement,
Oh teacher, give also the lesson of love.
How long wilt thou teach the wisdom of the Greeks?
Learn also the wisdom of those who have faith.³²
How long with this jurisprudence and baseless theology,
Wilt thou empty thy brain? Oh exuberant one,
Thy life is spent in discussing conjugation and syntax,
Learn also a few words about the principles of love.
Illuminate thy heart with resplendent lights,
How long wilt thou lick the bowl of Avicenna?

The Lord of the universe, the King of this world and the next³³
Called the left-over of the believer a remedy, Oh grieved one,
But the left-over of Aristotle and Avicenna,
When has the illuminated Prophet called it a remedy?
Go rip thy breast in a hundred places,
And clear thy heart of all these stains.³⁴

Not only does Sheikh-i Baha'i suggest that man should not busy himself solely with formal science and that he should seek to reach the divine gnosis hidden in the revelation, but he also reminds man that he should not become so accustomed to his world as to forget his original home. It has been a constant theme of the gnostics throughout the ages that the spiritual man being a stranger in this world must take the perilous journey to return to his original abode.³⁵ In the same *Nan wa Halwah*, while commenting upon the Prophet's saying, "The love of the country comes from faith," he writes,³⁶

"This country is not Egypt, Iraq or Syria,
It is a city which has no name.
Since all these countries belong to this world,
The noble man will never praise them.
The love of this world is the source of all evil,
And from evil comes the loss of faith.
Happy is the person who, through divine guidance,
Is led in the direction of that nameless city.
Oh son, thou art a stranger in these countries,
How wretched art thou to have become accustomed to it!
Thou hast remained so long in the city of the body,
That thou hast completely forgotten thy own country.
Turn away from the body and gladden thy soul,
And remember thy original home.
How long wilt thou, oh victorious falcon,
Remain away from the sphere of the spirit?
It is a shame for those, oh artful one,
To shed thy feathers in this ruin.
How long, oh hoopoe of the city of Saba,³⁷
Wilt thou remain in estrangement with feet tied?
Seek to untie the cords from thy feet,
And fly where 'there is no space'".³⁸

Shekhi-i Baha'i was one of those rare falcons who, while outwardly in the midst of this world, had flown to the "land of nowhere." He did not write in the technical sense so much about the Hikmat as Mir. Damad or Mulla Muhsin Fa'id did, but he reached such a degree of spiritual realization above and beyond theoretical formulations that all of his writings are spiritually precious. Even his compositions in the various religious and natural sciences bear the perfume of his spirituality. His writings present a balance between the exoteric and the esoteric, the metaphysical and the cosmological, which serve as an example of what the relation between the various aspects of a tradition, might be and could be when the principal integrating influence of gnosis is present.

Mir Damad

One of the most influential figures of the Safawid School was Muhammad Baqir Damad, better known as Mir Damad. He and his student, Mulla Sadra, must be considered to be the greatest Hakims of the period. Being the grandson of Muhaqqia-i Karaki and descendant of a distinguished Shi'ah family, Mir Damad received the best education possible in all branches of learning. His most famous teacher was Sheikh Hussain ibn 'Abd al-Samad 'Amili, the father of Sheikh-i Baha'i, who later on became his most intimate friend and companion at the Safawid Court.³⁹ Mir Damad soon became a leading authority on Kalam, Hikmat, Fiqh and even in the occult and natural sciences.⁴⁰

In Ispahan he attracted numerous students to himself. His most famous disciples were Mulla Sadra, Sayyid Ahmad 'Alawi, the commentator of the *Shifa'*, Mulla Khalil Qazwini whose commentary upon the *Usal al-Kafi* is very well known in Persia, and Qutb al-Din Ashkiwari, the author of a universal sacred history and several philosophical and gnostic treatises.⁴¹ Mir Damad, more than anyone else, was responsible for the revivification of ibn Sina's philosophy and ishraqi wisdom within the context of Shi'ism and for laying the ground for the monumental work for Mulla Sadra. Mir Damad did much to revive what he referred to as the Yamani wisdom (*falsafih-i Yamani*), the wisdom of the prophets, in contrast to the more rationalistic philosophy of the Greeks.⁴² He has been entitled the Third Teacher (*Mu'allim-i thalith*) after Aristotle and Farabi.

The writings of Mir Damad, both in Arabic and Persian, many of which are incomplete, are written in a very difficult style which adds to the difficulty of understanding their contents. These writings include several treatises on Kalam, works on Fiqh like *Shari' al-Najat*, *al-Ufuq al-Mubin* on Being, time, and eternity, *al-Sirat al-Mustaqim* on the relation between the created and the eternal, *Taqwim al-Imam* on Being, creation, and God's knowledge, several other major treatises on Hikmat including the *Qabasat*,⁴³ *Taqdisat*, *Jadhawat*, and *Sidrat all-Muntaha*,⁴⁴ several Qur'anic commentaries like *Amanat-i Ilahi*, commentaries upon the *Istihisar of Khuwaja Nasir al-Din Tusi* and the metaphysics of the *Shifa'*, the *Khalsat al-Malakut* on gnosis,⁴⁵ and a collection of poems in Persian and Arabic including the *Mushariq al-Anwar*, written under the pen name, *Ishraq*.

After a life-time spent in writing, teaching, and reading the Qur'an to which he was much devoted, and having prepared the ground for the whole group of sages, especially Mulla Sadra, who were to carry his ideas to their ultimate perfection, Mir Damad died on the way between Najaf and Karbala in Iraq in 1041/1631.

The thought of Mir Damad is marked by two features which distinguish him from the other Hikims of the period, the first the organization of his treatises and the second the notion of eternal creation, *huduth-i dahri*, which is the central and ever-recurring theme in his writings. As for the organization of his works, like the *Qabasat* and *Taqdisat*, it differs for the most part from that of the traditional Muslim books on philosophy and Hikmat which usually begin with logic and then proceed to natural philosophy (*tabi'iyat*), mathematics (*riyadiyyat*), and theology (*ilahiyyat*).⁴⁶

For example, in the Qabasat the ten chapters of the book concern the various meanings of creation and the division of Being, kinds of anteriority, multiplicity, appeal to the Qur'an and the Hadith, nature, time, and motion, criticism of logic divine omnipotence, and intellectual substances, chain of Being, and finally pre-destination.⁴⁷

The second marked feature of Mir Damad's exposition of Hikmat concerns the notion of time. It is well known that the question whether the world is created (hadith) or eternal (qadim) has been one of the major points of dispute between the philosophers and theologians in both Islam and Christianity as well as among the Greeks.⁴⁸ Mir Damad seeks a solution to this question by dividing reality into three categories: zaman or time, dahr, and sarmad; the latter two are kinds of eternity. This division is ontological and not just logical or theoretical.⁴⁹

The divine essence or ipseity (dhat) is above all distinctions and qualities; yet it is also the source of the divine names and attributes which are both one with the essence and yet distinct from it. This immutable relation between the essence and the attributes, which cannot be changed from either side, the attributes being a necessary determination (ta'ayyun) of the essence to Itself by Itself, Mir Damad called sarmad. It is an eternity in the absolute sense, above all contingencies. The names and attributes, which are the same as the archetypes, Platonic ideas, or the lords of the species (rabb al-nau') as the Ishraqis call them, in turn generate the world to change.

They are the immutable intelligences of this world, and each species in this world is a theurgy (tilism) for its archetype. The relation between the immutable archetypes and the world change is like the reflection of the moon in a stream of water in which the image of the moon remains unchanged while the substance in which it is reflected, i.e. water, flows on continually. This relation between the immutable and the changing Mir Damad calls dahr. Finally, the relation between one change and another is called time (saman), in the sense of quantity and measure of change as Aristotle had already described it.⁵⁰

Since the world was brought into being through the intermediate world of archetypes, its creation is dahri not zamani, i.e. the world was not created in a time which existed before the world came into being but with respect to a dahr which stands above the world.⁵¹ The creation of this world is, therefore, huduth-i dahri, ibda', and ikhtira' and not huduth-i samani, wad', and lakwin. Time has a reality in its own plane of being, but the world of dahr, the world of the archetypes, time does not even exist. Moreover, the changing physical world ('alam-i jismani) depends for its existence upon non-existence ('adam) in the world of archetypes.

While it exists in time (zaman), it is non-existent in dahr and has no share in the angelic mode of being, proper to the world of dahr, of which it is no more than coagulation. Likewise, the world of dahr, of the archetypes, is non-existent in the divine essence, in the world of sarmad (the eternal world). In the divine essence (dhat) there is neither dahr nor zaman, neither archetype nor body; God is alone in His majesty.⁵² Yet, dahr exists on its own level and zaman on its own. Sarmad is the cause of dahr and dahr the

cause of zaman,⁵³ so that ultimately the divine essence is the cause of all things, while in its essence nothing may even be said to exist.

The Jadhawat, the contents of which we will now briefly survey, is one of the works in which Mir Damad presents the complete cycle of his metaphysical ideas combined as usual with the Qur'anic text, the Hadith, and his own verse.⁵⁴ In the first judhwah or particle of fire, of which the word jadhawat is the plural, Mir Damad divides the "book of divine existence," of the chain of Being, into two parts, one in which there is an effusion or theophany (tajalli) away from the divine essence and the other in which there is a return to the origin: the first extending from the divine essence to prime matter or hyle and the other from the hyle back to the origin of all existence. Moreover, each chain is divided into a longitudinal (tulil) order and a latitudinal ('ardi) order.⁵⁵ The longitudinal order of the chain of effusion includes five essential degrees:

1. The degree of pure intelligences, the Victorial lights (anwar-i qahirah) the first member of which is the universal intellect ('aql-i kull), i.e. the first light to issue forth from the Light of lights (nur al-anwar).

2. The degree of heavenly souls (nufus-i falakiyyah), the governing lights (anwar-i mudabbirah), the first number of which governing the first heaven is called the universal soul (nafs-i kull).

3. The degree of the natural souls (nufus-i muntabi'ah) and the archetypes of the heavens, the planets, the four natures, the elements, and compounds.⁵⁶

4. The degree of bodily form (surat-i jismiyyah), i.e. the Aristotelian form, which is an extended substance and is of one species.

5. The degrees of hyle, from the matter of the highest heaven to that of the world of generation and corruption.⁵⁷

As for the longitudinal order of the chain of return to the divine essence, it too, includes five stages:

1. The degree of absolute body (jism-i mutlaq) and bodies comprising the elements and the heavens.

2. The degree of composed bodies which come into being from the combination of the elements and have a species of their own, e.g. minerals.

3. The degree of plants possessing the vegetative soul.

4. The degree of animals possessing the animal soul.⁵⁸

5. The degree of men possessing the intellectual soul which is of the same substance as the intelligences of the descending chain, above both of which there is nothing but the Truth (Haqq) Itself.⁵⁹

Each of these degrees, both in the descending and the ascending chains, have their several members that constitute the latitudinal extension of each degree.

The world of the intelligences (mujarradat) is called the world of the invisible (ghaib), or command (amr), or malakat, or intellect ('aql) or life (hayat), or light (nur), while the world of bodies is called the world of creation (khalq), vision (Shahadat), or dominion (mulk), or death (maut), or darkness (zulmat). Man's nature is composed of these two worlds in such a way that he contains the whole world in himself; he is the microcosm as the world is the macrocosm. His intellect is like the sun, his soul like the moon,

and his body like the earth, and as is the case with the heavens, man can also have an inner eclipse, i.e. the earth of his body can prevent the light of the sun of the intellect to shine upon the moon of the soul. The purpose of the two chains of descent and ascent is to bring into being man, who contains both the chains within himself and who can, therefore, ascend to heaven as well as descend to the lowest depths of existence.

The macrocosm is a conscious being whose head is the highest heaven, whose heart is the sun and whose other organs correspond with those of man. It is compared symbolically to a man whose head is pointed towards the North Pole, the right side towards the west, the face towards heaven, the feet towards the south, and the left side towards the east.

The totality of these degrees, the macrocosm and the microcosm together, is the book of God, in which each being is a word or rather a letter.⁶⁰ These words and letters are written by the divine Pen (qalam) which symbolizes the intellect. The Pen writes the truth of things upon the human soul which is called the isphabad light (nur-i isphabadi). More specifically, the Pen writes the truth of things upon the soul of the prophet who in turn “writes” the knowledge of things upon the soul of man and through the intelligences, upon the pages of creation and existence. The intelligences are not limited to the nine heavens, but as the Ishraqis have asserted, in number they equal the fixed stars in addition to the heavens and extend all the way down to the heaven of the moon. The intelligence of this heaven is called “the giver of forms” (wahib al-suwar) or the active intellect (aql-i fa‘‘al) which gives being as well as form to the sublunary region.⁶¹

The heaven of the fixed stars is the meeting place of the corporeal and intellectual lights, the boundary between formal and formless manifestation. This heaven has its own soul and intelligence but, in addition, each star in it is also a possessor of intelligence and a soul proper to itself. As to the other heavens, they also have their general intelligence and soul as well as particular intelligences and souls all of which cast their illuminations upon the sublunary region. The intelligence of the heaven of the sun is Gabriel whose grace is spread throughout the heavens and the earth.

Having considered the chain of Being, Mir Damad turns to a discussion of unity (tauhid) starting from “there is no divinity but God” (la ilaha illa Allah) to, “there is no being but He and no truth but He” (la maujudun illa Huwa wa la haqqun illa Huwa).⁶² For the real gnostic every being is nothing but Being. Mir Damad compares the relation of Being to existence with that of the number one to other numbers, which runs through all numbers without entering into them, which relation neither the soul nor the intellect can understand, yet its effect is felt everywhere.⁶³

The Divine Being by His essential unity encompasses all things; His unity is before, with, and after both dahr and zaman. His unity before dahr is the unity of His command, with dahr, the unity of the universal intellect, after dahr, the unity of the universal soul, unity with time (zaman) and unity of the elements and compounds.

As for the generation of multiplicity from unity, Mir Damad rejects the Peripatetic view of authors like ibn Sina who consider that the first intellect brings multiplicity into being by the three relationships possible for it:

necessity by something other than self, the intellection of the divine essence, and the intellection of its own essence. For Mir Damad just as the number of intelligences is unlimited so are there possible relationships beyond the number determined by the Peripatetics.⁶⁴ Likewise, the intelligences have a great many illuminations and effusions beyond the categories set forth by the Aristotelians, one intelligence being victorial (qahir) and the other passive and receptive (maqhur). Each heaven as well as each body, simple or composed, has its archetype (rabb al-nau-'-) in the world of divine command ('alam-i amr) which is changeless and is to its species what the soul of man is to his body.

Between the world of intelligences and the physical world there is an intermediary world, the so called eighth climate which Mir Damad, following the ancient Ishraqi sages calls hurqalya,⁶⁵ the world of separated imagination (khayal-i munfasil), or the purgatory (barzakh). Human imagination regarded as a gulf extending from this vast cosmic ocean. This world contains the forms or Platonic ideas of all physical bodies without being in a specific place. The mythical cities of Jabulqa and Jabulas⁶⁶ are located in it, and bodily resurrection on the Last Day, miracles, and the passage of great distances in a short time, all take place in this intermediary world which is a bridge to be crossed before reaching the spiritual world.

In order to cross this bridge and make the return journey through the ascending chain, man must become familiar with the divine names, especially the Great name (ism-i a'zam) which contains all the others. All the prophets and saints derive their being from these names, and the creatures are their effects. The spiritual world is called the world of invocation ('alam-i tasbih) because the realities of that world are the divine names. Man, therefore, can regain the world only by invoking the names and becoming unified with them.⁶⁷

The gnostic who has achieved this end sees the whole world through the intelligible world; in fact, he sees nothing outside the Divine. As long as man lives in this world no matter how much he has separated his soul from his body and achieved catharsis (tajrid), he is still in time and space. It is only when he dies and leaves the world of darkness for that light that he becomes completely free from the conditions of terrestrial existence of zaman, and it is only then that he enters into eternity (dahr).

The inner constitution of man forms a bridge between the worlds of time and eternity, the sensible and the intelligible. Man possesses four degrees of perception: sensation (ihsas), imagination (takhayyul), apprehension (tawahkum), and intellection (ta'aqqul), the degrees which stretch between these two worlds; on the one hand, it abstracts perceptions from the sensible world and, on the other, receives the illumination of the intelligible world which it clothes in the forms of sensible, i.e. words and names which are the external dress of truth.⁶⁸

Mir Damad echoes earlier Sufi and Pythagorean doctrines in assigning a particular significance to the numerical symbolism of letters. He writes, "The world of letters corresponds to the world of numbers, and the world of numbers to the world of Being, and the proportion of the world of letters to the proportion of the world of numbers and the proportion of the world of

numbers to the combinations and mixtures of the world of Being.”⁶⁹ He calls the sciences of the properties of letters and their combination divine medicine and says that letters have come into being from the conjunction of planets with the signs of the Zodiac, for example alif has come into being by Mars crossing the first degree of Aries. He establishes correspondence between the 28 letters of the Arabic alphabet and the equal number of the stations of the moon and works out this correspondence in great detail.⁷⁰

In establishing a relation between numbers, letters of the alphabet, and the heavens, Mir Damad, like many sages before him, seeks to point out the common ground between the book of revelation and the book of nature, as well as the relation between the sensible world and the intelligible world. In his writings it is quite clear that both metaphysics and cosmology are to be found in the esoteric (batini) meanings of the Qur’an and that through the understanding of the symbolism of letters and numbers and the sapiential exegeses of sacred books one can come to know not only the Qur’an which corresponds to the world of creation, the Qur’an-i tadwini, i.e. the logos or the reality of Mohammad (haqiqat al-Mohammadiyyah).

Mir Abu al-Qasim Findiriski

The third famous triumvirate of sages from Ispahan,⁷¹ Mir Findiriski, spent much of his life travelling outside Persia, especially in India where he was highly respected by most of the princes and where he made the acquaintance of many Hindu sages. He became well acquainted with Hinduism and even wrote a commentary upon the Persian translation of the Yoga Vasistha by Nizam al-Din Panipati, which is one of the major works on Hinduism in Persian. In the Muslim sciences he was a master in philosophy (Hikmat), mathematics, and medicine and taught the Shifa’ and the Qanun of ibn Sina in Ispahan where he died in 1050/1640.

The most interesting aspect of Mir Findiriski’s life is his complete detachment, even externally, from the world. As a Sufi, in spite of his having advanced very far upon the Path and having reached the state of pure contemplation and illumination, he mingled with the common people and wore the coarsest wool and yet he was one of the most respected men in the Safawid Court.⁷² His manner resembled that of the Hindu Yogis with whom he had had so much contact. He was a real man among men and one of the most striking Sufis of his time. While completely detached from the world and even from purely formal learning, he composed several important treatises including one on motion (al-harakah), another on the arts and sciences in society (sand‘iyyah), the book on Yoga already mentioned, Usul al-Fusul on Hindu wisdom and a history of the Safawids.

Moreover, he, like Mir Damad and Sheikh-i Baha-i, was an accomplished poet showing the development in him of the gnostic element which is the only possible common ground between traditional philosophy and poetry. The most famous of his poems is a qasidah, based upon that of Nasir ibn Khursau Dehlawi, which is one of the best known poems on Hikmat in Persian. It has been taught and commented upon many times since its composition, the more famous commentaries on it being those of Mohammad Salih Khalkhali and Hakim ‘Abbas Darabi. Because of the importance of this poem in summarizing some of the basic elements of

Hikmat as it was revived during the Safawid period, English translation of some of the verses is given below.

“Heaven with these stars is clear, pleasing, and beautiful,
Whatever is there above has below it a form.⁷³

The form below, if by the ladder of gnosis

Is trodden upward, becomes the same as its principle.
No outward apprehension can understand this saying,
Whether it be that of an Abu Nasr or of an Abu ‘Ali Sina.⁷⁴
If life were not an accident under this ancient heaven,
These bodies would be forever alive and erect.
But whatever is an accident must first have a substance,
The intellect is our loquacious witness to this claim.
If one can obtain these qualities⁷⁵ form the sun,
The sun is itself light and shines upon all things while keeping the unity.

The intellect form which is endless and immortal

Of the life of the universe, I say that if thou knowest the relation of the soul and the body,

In the heart of every particle, then life becomes both evident and hidden.
God has placed seven heavens above us,
And seven others on the other side of the world in the life to come.
Thou canst reach heaven by their means,
Be true and walk the straight path for there is no falsehood there.
He who worships the world, the door of heaven will never open to him,
The doors will not open even if he stands before them.
He who is annihilated in Him finds eternal life,
He who is busy with himself, his affair is doubtless a failure.
The jewel is hidden in the mysteries of the ancient sages,
Only he who is wise can discover the meaning of these mysteries.
Pass beyond these words for they are forsaken by the people of the

world,

Find the Truth and tread its path, if thou art righteous.
Whatever is outside the essence will do thee no good,
Make thyself harmonious whether it be today or tomorrow.
The Being that is pure has no limit or description,
It is neither outside of us, nor with us, nor without us.

A beautiful thought is only beneficial when combined with virtuous deeds,

A thought with virtuous action is competent and beautiful.
To talk of goodness is not like doing good,
The name of sweetmeat on the tongue is not like sweetmeat itself....
In this world and the next, with the world and without it,
We can say all these of Him, yet He is above all that.
The intellect is a ship, passion a whirlpool, and knowledge the mast,
God is the shore and the whole cosmos the sea.

The shore is reached with certainty; the sea of the possible has become the necessary...⁷⁶

How good it would be if the sages before us had said everything completely,

So that the opposition of those who are not complete⁷⁷ would be removed.

Desire keeps the soul in bondage in this world,

While thou hast desire, thy feet are tied.

Each wish in this world is followed by another wish,

The wish must be sought beyond which there is no other.”

Mir Findiriski occupied himself not only with metaphysics and the theoretical sciences but also with the sciences of society, of traditional society in which the social structure itself has a direct bearing in metaphysical principles. In this treatise on arts and sciences (sana‘iyyah),⁷⁸ he distinguishes¹² vocations or arts and sciences in society depending upon the subject with which each one deals. The subjects of the arts and sciences he enumerates are as follows: (1) The subject is universal and the discussion concerns knowledge as well as action from both of which there comes only good, (2) the subject is universal and the discussion concerns both knowledge and action from both of which there comes evil, (3) the subject is universal and the discussion concerns knowledge from which there comes only good, (4) the subject is universal and the discussion concerns knowledge from which there comes evil, (5) the subject is universal and the discussion concerns action from which there comes only good, and (6) the subject is universal and the discussion concerns action from which there comes evil.

To this list Mir Findiriski adds a series of arts and sciences the subject of which is no longer universal. These include: (7) those arts and sciences the subject of which is particular and the discussion concerns knowledge and action from which there comes only good, (8) the subject is particular and the discussion concerns knowledge and action from which there comes evil, (9) the subject in particular and the discussion concerns only knowledge from which there comes only good, (10) the subject is particular and the discussion concerns the knowledge from which there comes evil, (11) the subject particular and the discussion concerns only action from which there comes only good, and, finally (12) the subject is particular and the discussion concerns only action which there comes evil.⁷⁹

The first 12 categories listed above concerns the prophets, saints, and sages, the most exalted of men, who maintain the order of the universe, there being a prophet for each cycle of history and each people. The second concerns those who oppose the prophets and sages, those who are the deniers of truth, and the sophists and agnostics who are the lowest of men. The fourth class is the opposite of the first, i.e., the enemies of Hikmat and theology, of those who, seeing differences in the expressions of the various sages, have denied the one truth which lies behind the diversity.⁸⁰ The fifth category is that of the jurists (juqaha’) who cultivate the practical sciences, and the sixth is that of their opposites like Mazdak,⁸¹ who concern themselves only with their bodies and remain oblivious of the order of both this world and the next.

The last six categories concern particular arts and sciences. The first of them, or the seventh in our list, is that of professionals in particular arts, like

physicians, engineers, and astronomers, and the eighth is that of their opposites, i.e. those who misuse each of these arts. The ninth category is like the particular sense of an organ of the body and concerns people who have only a theoretical knowledge of various arts and sciences, like music, medicine, or the principles of jurisprudence. The tenth is its opposite and in it are included those who make a false claim to know those sciences theoretically. The 11th category concerns arts and sciences which are limited to a particular subject and the 12th its opposite which concerns the rejection of these same arts and sciences.

In this classification we can already see the hierarchic structure of society at the top of which stand the prophets and saints in whom knowledge and action are combined, below them the hukama' and the theologians, then those concerned with practical arts and the particular sciences. The nobility of a vocation in each case depends upon the nobility of the subject-matter treated. Likewise, the degree of degradation of a person or group depends upon the truth that has been denied, the higher the degree of a truth, the baser is he who denies it. The categories outlined by Mir Findiriski reflect the hierarchy within Hikmat itself. In both cases the religious sciences, like theology, and the wisdom of the prophets and saints above all the other categories.

Mulla Muhsin Faid-i Kashi

Mohammad ibn Shah Murtada ibn Shah Mahmud, better known as Mulla Muhsin or Faid-i Kashi, is the most famous of the sages of the generation following that of Mir Damad, Sheikh-i Baha'i, and Mir Findiriski. Born in Kashan in 1007/1600, he spent some years at Qum and then went to Shiraz to complete his studies with Mulla Sadra whose daughter he later married. He also studied with Mir Damad and Sheikh-i Baha'i but was more closely associated with Mulla Sadra. Just as Mir Damad produced a series of outstanding students, the best known of whom was Mulla Sadra - the greatest of the Safawid Hakims to whom we shall turn in a separate chapter - Mulla Sadra in turn produced a galaxy of famous students among whom Faid-i Kashi and Mulla 'Abd al-Razzaq Lahiji, both his sons-in-law, are the most important.⁸²

The genius of Mulla Sadra consisted largely in unifying the three perspectives of formal revelation of shar', purification of the soul leading to illumination (kashf), and rational demonstration (falsafah) into a single universal vision in which all these paths lead to the same truth. All of his followers sought to preserve the unity established by their master, each emphasizing some one aspect of it. For example, later sages like Qadi Sa'id Qumi, Mulla 'Ali Nuri, and Aqa 'Ali Zunuzi sought to correlate revelation and reason, and Aqa Mohammad Bidabadi and Aqa Mohammad Rida' Qumshih, reason and gnosis. Others continued the path trodden by Mulla Sadra himself and emphasized the harmony of all the three paths mentioned above. Mulla Muhsin Faid and Haji Mulla Hadi Sabziwari, the most famous Persian thinker of the last century, belong to the last group. Mulla Muhsin's writings display a harmonious integration of reason, revelation, and gnosis with lesser emphasis upon reason. He succeeded perhaps more than anyone

else in the Shi'ah world to bring about a complete harmony between Law and spiritual life, Shari'ah and Tariqah.

In many ways Mulla Muhsin may be considered to be a Shi'ah Ghazālī, not only because of his pre-occupation with harmonizing the exoteric and the esoteric views, but also for his treatment of a spiritualized ethics which forms the requirements for the following Path. He even re-wrote the well-known Ihya' 'Ulum al-Din of Ghazālī under the name of al-Mahajjat al-Baida' fi Ihya' al-Ihya', substituting traditions (Hadith) from the Shi'ah sources for those from the Sunni ones given by Ghazālī.⁸³

The writings of Mulla Muhsin both in Arabic and Persian are too numerous to mention here.⁸⁴ Among the more famous, one may name Haqq al-Yaqin, 'Ain al-Yaqin, and 'Ilm al-Yaqin on Hikmat, al-Safi, al-Wafi, and al-Shafi on Qur'anic commentary and Hadith, Mafatih al-Sharaya' on jurisprudence, al-Tathir on ethics, Jala al-'uyun, Zad al-Salik, and Kalimat-i Maknunah on Sufism, numerous treatises on esoteric meaning of acts of worship, on various invocations, on particular sciences including astronomy, selections from and commentaries on the Rasa'il on the Ikhwan al-Safa, the Futuhat al-Makkiyyah of ibn 'Arabi, and the Mathnawi of Jalal al-Din Rumi, and a large collection of poems consisting mostly of verses of Sufi inspiration. His works both in poetry and prose have remained very popular in Persia and ethical and social teachings have attracted particular attention in the past decades.

Mulla Muhsin's thought marks the final integration of Hikmat into Shi'ism. Hikmat in Persia had been moving in this direction for many centuries from the time of al-Farabi and ibn Sina. Suhrawardi Maqtul took the decisive step in regarding knowledge as personal illumination by the heavenly guide or "guardian angel." Mulla Sadra following him made the universal intellect the criterion of knowledge. Mulla Muhsin took a further step in this direction in identifying this intellect with the Shi'ah Imams, in whom the light of Mohammad (al-nur al-Mohammadiyyah) is manifested and who are called the innocent (ma'sum) intellects.⁸⁵ Only by union with them, with the pure intellects, can one gain ultimate knowledge.

One of the important treatises of Mulla Muhsin, in which gnosis, Hikmat and Shar' are blended in characteristic fashion in the Kalimat-i Maknunah written in a mixture of Arabic and Persian.⁸⁶ It treats a complete cycle of theoretical gnosis so that its discussion gives a fair example of the totality of Mulla Muhsin's general perspective.

The work begins by assuring the reader that there is no way of reaching the essence of the Truth because the Truth encompasses all things. Everything is its manifestation, but only the elite (khwass) know what they see. Being is like light, but since its opposite does not exist in this world as in the case of light which stands opposed to darkness, one cannot come to know it so easily. God is hidden because of the excess of His light, no veil can cover Him because every veil is a limitation and God is above all limitations.⁸⁷ Being is the Truth which subsists by Itself, while everything else subsists by consisting only of a reflection of Being itself.

The divine attributes and names are identical with the divine essence, while in themselves they are distinct. Likewise the forms of all beings in the

divine intellect, i.e., the quiddities or essences, the mahiyat or a‘yan al-thabitah,⁸⁸ are in one respect identical with and in another distinct from essence. Each being subsists by one of the divine names and its very existence consists in the invocation of that name. The archetype, a‘yan al-thabitah, have two aspects; on the one hand, they are hidden and Truth is manifest, and on the other, Truth is the mirror in which they are reflected, in which case truth is hidden and they are manifest. These two aspects correspond also to two states of contemplation: one of Truth (Haqq) and the other of creation (khalq). The perfect gnostic contemplates both mirrors, he sees the cosmos as a mirror in which Truth is reflected, and his own essence as a mirror in which both the cosmos and Truth are reflected. Mulla Muhsin advises the sage to take a further step in eliminating himself also so that there remains nothing but Truth.⁸⁹

Mulla Muhsin follows certain earlier Sufis in considering the world to be re-created at every instant,⁹⁰ so that its continuity is only apparent. The real continuity is “vertical,” i.e. between Truth and its manifestations, not “horizontal” and “substantial,” i.e. between parts and instances of the created world. The world is like a flowing stream which, although apparently a continuous and subsistent body, changes at every instant and a new particle coming to take its place.

The creation of the world or the effusion of unity into multiplicity does not take place immediately but through the divine names, each creature being the theophany (tajalli) of a particular name. The name Allah is the supreme master (rabb al-arbab) of all the names of theophany of which is the universal man (al-insan al-kamil). Although the stages in which creation comes into being are numerous, Mullah Muhsin names five degrees which mark the main steps. In the first degree is the divine essence which is above all distinctions and determinations; in the second are the names which are the manifestations of Truth in the world of divinity, uluhiyyah, in the third are the divine acts and world of spirits which are the manifestations of Truth in the world of Lordship, rububiyyah, in the fourth is the world of “ideas” and imagination (khayul)⁹¹ which is the manifestation of Truth in the world of varying forms, and in the fifth is the world of the senses which is the manifestation of Truth in determined forms.⁹² Everything in the physical world has its archetype in the world of imagination, while everything in the world of lordship is a form of one of the divine names, each name an aspect of the divine essence.

Man alone among creatures is able to cast aside these veils and reach the divine origin of things. He has a particular soul brought into being with his body, which soul is independent of matter, and also a universal soul which exists before the body and is manifested only in the spiritual elite. Moreover, man has a vegetative soul consisting of the faculties of attraction, repulsion, digestion, growth, and retention originating in the heart, a sacred rational soul (nafs-i natiqah-i qudsiyyah) with the faculties of meditation (fikr) and invocation (dhikr), and the universal divine soul (nafs-i kulliyyah-i ilahiyyah), not possessed by all men, with the faculty of reaching the station of annihilation (fana’) in the Divine.⁹³

The goal of each man should be to awaken the potential faculties within him until all the accidental obstacles are removed and he becomes identified with the universal man, the theophany of the supreme name. Then he will be able to contemplate Absolute Being and thereby fulfil the purpose of all creation and sustain the whole universe.

The universal man is either a prophet or a saint. Absolute prophethood (nubuwwat-i mutlaq) is the supreme station, the perfect “form” of unity, the first pen, and the Pole of Poles, qutb al-aqtab, upon which all the prophets and saints depend. The inner (atin) dimension of this prophecy is absolute sainthood (wilayat-i mutlaq). Mulla Muhsin identifies absolute prophethood with the light of Mohammad, and absolute sainthood with the light of ‘Ali. The prophethood of all prophets depends upon absolute prophecy as the sainthood of all saints depends upon absolute sainthood. Prophethood began with Adam and found its completion in Prophet Mohammad. Sainthood will reach its completion gradually until it culminates in the 12th Imam, the Mehdi. Absolute prophethood is the treasure of all possible perfections and the whole cosmos in the expansion and manifestation of its inner qualities.⁹⁴

Gnosis and illumination are themselves the fruit of the tree of prophethood. Mulla Muhsin insists that the source of Hikmat was originally the sacred spirit of the prophets; this wisdom, however, was misunderstood and misinterpreted by men of the later period, i.e. the Peripatetics and other later schools of Greek philosophy, and was revived only in the light of the revelation of the Prophet of Islam and his family. He who wishes to be initiated into it must, therefore, seek the aid of the prophets and saints and this can be achieved only by invocation and meditation and the purification of the heart. Only he who has trodden this path and become a true Hakim can be considered the real heir to the saints and the prophets.⁹⁵

Mulla Mohammad Baqir Majlisi

One cannot terminate a study of the intellectual life of the Safawid period without mentioning the two Majlisis, father and son, especially the son Mohammad Baqir who stands as one of the outstanding figures of the period. The first Majlisi, Mohammad Taqi (1003/1594 - 1070/1659), was one of the students of Sheikh-i Baha’i and an outstanding theologian and Sufi of his time.⁹⁶ His son, the second Majlisi (1037/1628 - 1110/1699), however, surpassed his father in fame and power and became the most dominant figure of Shi’ism. Having studied with his own father, Mulla Khalil Qazwini and Mulla Muhsin Faid, he in turn became the master of over a thousand disciples including Sayyid Ni‘matullah Jaza’iri, well known for his many writings, especially the account of his own life as a student.

The second Majlisi is especially famous for revivifying the various branches of the Shi‘ah sciences and for assembling the writings of the earlier doctors of Shi‘ism and prophetic hadith into encyclopaedias which have henceforth become the main reference for all who undertakes religious education in the Shi‘ah madrasahs. The most important and famous of these is the Bihar al-Anwar summarized in the Safinat al-Bihar of Sheikh ‘Abbas Qumi, the lithographed edition of which occupies 24 volumes: Haqq al-Yaqin in Usul, Hayat al-Qulub, a commentary upon the Mir’at al’Uqul, a 12 volume commentary writing career enters into purely intellectual (‘aqli)

questions and treats of many essential religious subjects, especially eschatology and the conditions before the appearance of Mehdi, from an intellectual rather than a purely “confessional” point of view.⁹⁷

Of special interest in the religious life of Persia is Majlisi’s opposition to Sufism and even the denial that his own father, the first Majlisi, was a Sufi.⁹⁸ Furthermore, supported by the Court and many of the theologians and doctors, he opposed the intellectual method of the Hakims and philosophers with the result that both the Sufis and the Hakims fell into disgrace and had a lot of difficulty in official religious circles. The dynasty which had begun as the extension of Sufi order ended by opposing all Sufism and gnosis itself. It was not long after the death of the second Majlisi in fact that the Safawid dynasty itself fell before the Afghans, and Ispahan, the historic as well as the symbolic centre of this period of great intellectual activity was sacked and its libraries burnt.

D. Conclusion

This form of wisdom or Hikmat, some features of which we have sought to outline here, did not die with the termination of the Safawid dynasty. In the 13th/18th century Sufism was revived in Persia by Ma’sum ‘Ali Shah and Shah Tahir Dakani, two Ni’matullahi masters sent by Rida’ ‘Ali Shah from the Deccan to Persia. It was persecuted for a period but began to expand with the establishment of the Qajars. Likewise, the school of Hikmat continued through the students of Mulla Sadra and others from one generation to another until it produced Sheikh Ahmad Absai’i, the founder of the Sheikh movement,⁹⁹ Haji Mulla Hadi Sabizwari, and several other outstanding figures in the Qajar period, the light of whose teachings has not yet disappeared from the horizon of Persia. One can hardly understand the intellectual life of Islam in its totality without taking into account this last major period of Muslim intellectual activity, lasting from the Safawid period to the present, to the understanding of which we hope this chapter will serve as an introduction and as an incentive for further exploration.

Notes

1. A few authors like Gobineau, Donaldson, and E. G. Browne have touched upon certain aspects of Shi'ism in their writings. The only European author, however, who has delved with serious intention into the Shi'ah intellectual world is Henri Corbin, who during the past 20 years has done much to introduce the rich heritage of Shi'ism, especially as it has developed in Persia, to the Western world.

2. For the meaning of this word which denotes wisdom refer to the chapter on Shihab al-Din Suhrawardi Maqtul.

3. Sheikh Safi (647/1249 - 735/1334), one of the most important of Shi'ah Sufi saints, is still greatly respected by the Sufis, his tomb in Ardibil has remained until today an important place of pilgrimage. Being the disciple of Sheikh Zahid Gilani he was already a significant figure in his own day as testified by the biographical works like the Safwat al-Safa' by ibn Bazzaz, and Rashid al-Din Fadl Allah's letters to the saint and to the governor of Ardibil in his Munsha'at-i Rashidi. See also E. G. Browne, A Literary History of Persia, vol 4, Cambridge University Press, Cambridge, 1924, Chap. 2.

4. For a history of the Safawid period, see E. G. Browne, op. cit., vol 4; L. Lockhart, The Fall of the Safawid Dynasty and the Afghan Occupation of Persia, Cambridge University Press, Cambridge, 1958, and the traditional sources of which some of the more important include the Safawat al-Safa' by ibn Bazzaz, Ahsan al-Tawarikh by Hassan Baik Rumlu, Zubdat al-Tawarikh by Mohammad Muhsin ibn 'Abd al-Karim, and the universal history Nasikh al-Tawarikh by Mriza taqi Sipih.

5. The purpose of theology is to protect the truth of a revelation against false reasoning; its role is, therefore, defensive. It is the shell which protects the inner spiritual life, not that life itself. If there were no danger of rationalism and false reasoning, there would be no need for theology. We, therefore, see theology coming into being with rationalistic philosophy, and where there is no tendency toward rationalism, there is no theology as this word is currently understood.

6. For a discussion of the meaning of ishraqi wisdom, refer to the chapter on Suhrawardi Maqtul.

7. The reason why the pre-Safawid sages of Persian like 'Ali Turkah Ispahani and ibn Abi Jumhur as well as the Safawid authors themselves have been neglected in the Western world, is that the quality of their wisdom is primarily gnostic ('irfani) like that of Sheikh al-Akbar Muhyi al-Din ibn 'Arabi by whose doctrines they were all influenced, that like him they can be understood neither by the rationalistic philosophers nor by the mystics as they have come to be understood since the Renaissance.

8. For the name of some of these Arab Shi'ah scholars, see E. G. Browne, op. cit., vol. 4, Chap. 8.

9. The science of Usul as an independent science has grown into monumental proportions only in the past few centuries reaching its height in the hands of Sheikh Murtada Ansari, the famous doctor of the Qajar period, who only a century ago made Usul into a science matching Kalam in its logical subtleties.

10. Shi‘ah theology reached its height in the seventh/13th century in the hands of men like Khuwaja Nasir al-Din Tusi and ‘Allamah-i Hilli.

11. See the chapter on Suhrawardi Maqtul. Generally, Hikmah in Arabic or Hikmat in Persian means wisdom in addition to the particular sense given to it as a divine science.

12. For the series of commentators and expositors of ishraqi wisdom, see the chapter on Suhrawardi Maqtul.

13. It is unfortunate that in books treating of the relation between faith and reason in Islam like A. J. Arberry’s *Revelation and Reason in Islam*, London, 1957, most of these authors are not taken into serious consideration.

14. For an account of the doctrines of ibn ‘Arabi, see T. Burekardt (Tr), *La sagesse des prophetes*, Paris, 1955; also idem, *Introduction to Sufi Doctrine*, tr. M. Matheson, Sh. Mohammad Ashraf, Lahore, 1959, which is an excellent general introduction to ibn ‘Arabi’s school of Sufism. See also Corbin, *L’imagination creatrice dans la souflame d’Ibn ‘Arabi*, Flammarion, Paris, 1958, which contains some useful chapters on his ideas and their spread in the east.

15. See S.M. Sadr, *Sheikh ‘Ala al-Daulah Simnani*, Danish Press, Teheran, 1334/1915.

16. This great Persian Sufi poet and sage has written several well-known summaries of ibn ‘Arabi’s doctrine including the *Lawa’ih* translated by Whinfield and Qazwini, Luzac & Co., London, 1928, the *Asha’at al-Lama’at*, and the *Naqd al-Nusus*.

17. The *Kitab al-Mujli* of ibn Abi Juhur and *Jami’ al-Asrar* and *Jami’ al-Haqa’iq* of Mulla Haidar ‘Ali Amuli are among the most important sources of Shi‘ah gnostic doctrines.

18. The best traditional sources for these earlier Shi‘ah authors are the *Raudat al-Jannat* of Mohammad Baqir Khunsari, lithographed edition, Teheran, 1306/1888; *al-Dhari‘ah* of Agh Buzurg Tihrani, al Gharra Press, Najaf 1355/1936 on; the *Tarikh-i Alam Ara-yi Abbasi* of Iskandar Baig Munghi, Teheran, 1334/1915; and of more recent composition the *Raihanat al-Adab* of Mohammad ‘Ali Tabrizi, Sa‘di Press, Teheran, 1331 - 33 Solar; the *Qisas al-‘Ulama’* of Mirza Mohammad Tunikabuni, Islamiyyah Press, Teheran, 1313 Solar; *Fihri-i Kutub-i Ihada’i Aqa-yi Mishkat* by M.B. Danish Puzhuh, University Press, Teheran, 1335/1916; see als H. Corbin, “Confession extatiques de Mir Damad” in the *Melanges Louis Massignon*, Institut Francais de Dames, Damas, 1955, pp. 331 - 78.

19. See Corbin, op. cit., pp. 333ff.

20. His name should not in way be connected with the heterodox Baha’i movement of the 13th/19th century.

21. For an account of the life and works of Sheikh-i Baha’i, see *Tarikh-i ‘Alam Ara-yi ‘Abbasi*, pp. 155 - 57; also Naficy, *Ahwal wa Ash‘ar-i Farsi-i Sheikh-Baha’i*, Eqbal Press, Teheran, 1316/1898.

22. Sheikh-i Baha’i is said to have built a bath house name Gulkan which had always had hot water without any fuel being used in it. When it was pulled down, people discovered a single candle burning under the water tank.

23. This book on mathematics which helped greatly in reviving the study of the mathematical sciences in Persia was a standard text-book for centuries and has been commented upon several times and translated into Persian by Mohammad Amin Najafi Hijazi Qumi and into German by G. H. F. Nesselmann who published the text and the translation in Berlin in 1843. Sheikh-i Baha’i revived the study of mathematics and astronomy in Persia after 100 years of neglect, having himself learned these sciences in Herat.

24. For a list of the nearly 90 works attributed to him, see his *Kulliyat-i Ash‘ar-i Farsi*, ed. M. Tauhidiput, Mahmudi Press, Teheran, 1336/1917, pp. 42 - 45.

25. *Ibid.*, pp 164 - 66.

26. Intoxication symbolizes ecstasy and spiritual union.

27. Maulan Jala’i al-Din Rumi is commonly referred to as Maulawi in Persian. This verse refers to Maulawi’s well-known rejection of rationalism in favour of gnosis. (The leg of rationalist is a wooden leg...).

28. Love symbolizes gnosis or the science which comes through contemplation and illumination rather than analysis and discursive thought.
29. Reference is to the famous theologian Imam Fakhr al-Din Razi.
30. This verse is in Arabic and is repeated immediately with only a little change in Persian.
31. That is, he is like a beast of burden.
32. Reference is to the wisdom of the Sufis are contrasted with that of the Greeks, the Hikmat-i Imani and the Hikmat-i Yunani.
33. The Prophet Mohammad (upon whom be peace).
34. Sheikh-i Bhah'i, Kulliyat..., pp. 18 - 19.
35. This theme appears in certain Hermetic writings, the Acts of Thomas, the Grail story, as well as in Islam in the visionary narratives of ibn Sina and many of Suhrawardi's gnostic tracts like Qissah Ghurbat al-Gharbiyyah; see H. Corbin, *Avicenne et le recit visionnaire*, Institut Franco-iranien, Teheran, and A. Maisonneuve, Paris, 1952 - 54, vol. 1, chap. 3, and Suhrawardi, *Oeuvres philosophiques et mystiques*, vol. 2, Institut Franco-Iranien, Teheran, and A. Maisonneuve, Paris, 1954, Prolegomene by H. Corbin.
36. Sheikh-i Baha-i, Kulliyat..., p. 23.
37. A city in the south of Arabia with which the name of the Queen of Sheba is associated.
38. La makan, meaning beyond the world of cosmic manifestation. Suhrawardi refers to this point which is the top of the cosmic mountain Qaf, as na kuja abad; see Suhrawardi, "Le bruissement de l'aile de Gabriel," tr. H. Corbin and P. Kraus, *Journal Asiatique*, Juillet-Sept., 1935, pp. 41 - 42.
39. For an account of the life and writings of Mir Damad, see M. Tunikabuni, *Qisas al-'Ulmaa*, pp. 333 - 35; *Raihanat al-Adab*, vol. 4, pp. 117 - 21; *Raudat al-Jannat*, pp. 114 - 16; *Tarikh-i 'Alam Ara-yi 'Abbasi*, pp. 146 - 47; *Danish Pazhuh, Fihrist...*, Vol. 3, 1, p. 152 and the good Introduction of his life and thought by Corbin, "Confessions extateiques de Mir Damad," pp. 340ff.
40. It is said that he had a lot of interest in the life of the bees and had accumulated a good deal of observational data about them.
41. For an account of these and other students of Mir Damad, see H. Corbin, op. cit., pp. 345 - 46.
42. The "Yamani philosophy" means the wisdom revealed by God to man through the prophets and through illumination; Yaman (Yemen) symbolizes the right or oriental (Mashriqi) side of the valley in which Moses heard the message of God. It is, therefore, the source of divine illumination in contrast to the Occident, the source of Peripatetic philosophy, the Occident symbolizing darkness and being on the plane of philosophy, i.e. rationalism. See. H. Corbin, *Le recit d'initiation et l'hermetisme en Iran*," *Eranos Jahrbuch*, vol. 17, 1949, pp. 136 - 37. For the symbols of the orient and Occident in ishraqi wisdom see the chapter on Suhrawardi Maqtul.
43. This major work has been commented upon several times. One of its most curious commentaries is that of Mohammad ibn 'Ali Rida ibn Aqajani, one of the students of Mulla Sadra; it runs over a thousand pages.
44. These last two works are among the important books on Hikmat in Persian, the others being in Arabic. Some manuscripts attribute Sidrat al-Muntaha to Mir Damad's student, Sayyid Ahmad 'Alawi, although in the *Jadhawat Mir Damad* refers to this work as being his own. In any case it is a product of his school.
45. For a translation and discussion of this work, see H. Corbin, op. cit., pp. 350ff.
46. See for example the *Shifa'* or *Najat* of ibn Sina and the *Kitab al-Mu'tabar* of Abu-Barakat al-Baghdadi. In some cases as in the *Danish Nameh-i Ala'i* of ibn Sina and many later ishraqi writings, the book begins with metaphysics and then proceeds to natural philosophy in the manner of Plato rather than Aristotle.
47.
See Mir Damad, *Qabasat*, Sheikh Mahmud Burujirdi, Shiraz, 1315/1897.

48. For a general discussion of this question, see L. Gardet, *La pensee religieuse d'Avicenne*, J. Vrin, Paris, 1951, pp. 38ff, and A. K. Coomarasawany, *Time and Eternity*, Artibus Asiac, Ascona, 1947, Chap. 4.

49. Mir. Dmad, *Qabasat*, pp. 1 - 10.

50. *Ibid.*, p. 7.

51. Mir Damad argues that time itself is the measure of the movement of the heavens and a condition for the existence of this world so that one cannot speak of a time before the creation of the world; *Qabasat*, p. 20.

52. For a comparison and affinity of these ideas with those of ibn 'Arabi, see *La sagesse des prophets*, Chapters One and Two.

53. In presenting this view of creation, Mir Damad draws heavily on earlier writings from Plato's *Timaeus* and the so-called *Theology of Aristotle* to the *Shifa'* of ibn Sina and the *Kitab al-Mu'tabar* of Abu al-Barakat. In each case he also criticizes the view of the previous writers who considered the world either to be eternal in itself or created in time from outside. Mir Damad's *Risalah fe Madhhab Aristatalis* is devoted to a discussion of the difference between the views of Plato and Aristotle on the question time and eternity drawing on Farabi's *Kitab Jam' bain al-Ra'yain*. Mir Damad's treatise is published on the margin of the *Qabasat*, pp. 140 - 57.

54. The *Jadhawat* (Bombay, lithographed edition, 1302/1884, pp. 203) begins with a poem in praise of 'Ali ibn Abi Talib the first lines of which are as follows:

Oh herald of the nation and the soul of the Prophet,
The ring of thy knowledge surrounds the ears of the intelligences.
Oh thou in whom the book of existence terminates,
To whom the account or creation refers
The glorified treasure of the revelation,
Thou art the holy interpreter of its secrets.

55. Suhrawardi also divides the angelic world into the longitudinal and the latitudinal orders, a division the influence of which upon Mir Damad is easy to discern. On the question of angelology the Safawid sages remained faithful to the ishraqi scheme combined with that of ibn Sina. See the chapter of Suhrawardi *Maqtul*.

56. The natures refer to the warm and cold, wet and dry, and the elements to the four traditional ones, fire, air, water and earth.

57. Mir Damad and Mulla Sadra, unlike Aristotle and his followers, posit some form of matter in every degree of formal manifestation.

58. Mir Damad mentions that there are 1,400 species of animals, 800 belonging to sea and 600 belonging to land.

59. *Jadhaudat*, pp. 2 - 13.

60. *Ibid.*, pp. 13 - 18.

61. *Ibid.*, pp. 18 - 28..

62. *Ibid.*, pp. 28ff.

63. In discussing *tauhid*, Mir Damad draws not only on ibn Sina and Suhrawardi but even on the *Nahj al-Balaghah* of the first Shi'ah Imam, the *Sahifah-i Sajjadiyyah* of the fourth Imam and other Shi'ah sources. He regards Pythagoras as the Imam of the Seitic sages (*Hukama-i Sami*) and one who received his wisdom through revelation. This view going back to Philo is held among the great majority of the Muslim sages and historians of philosophy.

64. *Jadhawat*, pp. 38ff.

65. This intermediary region plays an important role in the thought of Mulla Sadra and even more in the writings of Sheikh Ahmad Asha'i, the founder of the *Sheikhis* who still survive in Kerman.

66. These are two famous mythical cities through which initiates pass in their journeys and they appear often in initiatic narratives in Persian.

67. *Jadhawat*, pp. 54 - 63.

68. *Ibid.*, p. 100.

69. *Ibid.*, p. 103. In the same work, p. 92, the last part of which is wholly devoted to the important traditional Muslim science of *jafr*, he considers numbers to be the principles of beings, the illumination from the intelligible world, the "Michael of the degree of

existence” and adds that if a person acquires all the knowledge of numbers he will gain complete knowledge of the physical world. This view is very close to that of Pythagoras and his school. See Aristotle, *Metaphysica*, Book 5. In both cases number is not just the quantity of modern mathematics, but a “personality,” an entity which possesses a definite qualitative aspect. For the notion of the Pythagoreans, see H. Keyser, *Akroasis*, Verlag Gert Jatje, Stuttgart, 1947.

70. For a profound study of this subject as developed before Mir Damad, see S. T. Burckhardt, *La cle spirituelles de l’astrologie musulmane d’apres Ibn ‘Arabi*, Editions Traditionelle, Paris, 1950.

71. The other two are Sheikh-i Baha-i and Mir Damad who were close friends of Mir Findiriski and shared with him the respect and honour of the Safawid Court. For an account of the life of Mir. Findiriski whose complete name is Mir Abu al-Qasim ibn Mirza Baik Husain Findiriski, see *Raihanat al-Adab*, vol. 3 pp. 231 - 32.

72. The story is told of him in most biographies that one day Shah ‘Abbas, trying to admonish him for mixing with the common people, said, “I hear some of the leading scholars and sages have been attending cock-fights in the bazaar.” Mir Findiriski, knowing that the remark was meant for him, replied, “Your majesty, rest assured, I was present but I saw none of the ‘ulama’ there.” See *Riyad al-‘Arifin*, p. 276.

73. The text of this qasidah and the commentary by Khalkali have been published in Teheran, lithographed edition, 1325/1907. This verse means the celestial archetypes of Platonic ideas and their earthly reflections or shadows.

74. Reference is to Farabi and ibn Sina, the two early masters of masha’i philosophy in Islam.

75. “Qualities” means multiplicity of forms which become evident only when light shines upon them.

76. The later Muslim authors following ibn Sina divide reality into the Necessary Being (*wajib al-wufud*), the possible being (*mumkin al-wufud*) and the being that is impossible (*mumtani‘ al-wujud*).

77. All the arguments begin because each side considers only one aspect of the Truth. But those who are “complete,” that is, have a vision of the totality of the Truth, never enter into arguments.

78. Mir Findiriski, *Raisaleh-i Sand‘iyyah*, Sa‘adat Press, Teheran, 1317 Solar.

79. *Ibid.*, pp. 13 - 54.

80. Mir Findiriski adds that all the Greek philosophers before Aristotle were saying the same thing in different languages and that if one is instructed in the secrets (*rumuz*) of Hikmat, Hindu wisdom, and the Theology of Aristotle (i.e. the *Enneads* of Plotinus), all the different expressions will have the same meaning for him.

81. Mir Findiriski mentions Mazdak as the person who by a false interpretation of the Avesta preached the communization of women and property. He also mentions Carmathians (*Qaramitah*) as belonging to this group.

82. Mulla-i Lahiji, known as Fayyad author of several important treatises on Hikmat in Persian and Arabic mentioned already, deserves a separate study as one of the major figures of this period. There are brief accounts of him in E. G. Browne, *op. cit.*, vol 4, pp. 408 - 09, 435. See also the introduction by Sayyid Mohammad Mishkat to the new edition of *al-Mahajjat al-Baida‘*, vol. 1, Islamiyyah Press, Teheran, 1380 Solar, in which the significance of Faid’s doctrines and in particular the present work on ethics is discussed.

83. See Mulla Muhsin Faid-i kasha, *al-Mahajjat al-Baida‘ fi Ihya‘ al-Ihya‘*, four volumes, Islamiyyah Press, Teheran, 1380 - 81 Solar, in which in ten sections he deals with Sufi ethics based on Shi‘ah sources but following closely the model of *Ihya‘*.

84. The *Raihanat al-Adab*, vol. 3, pp. 242 - 44, mentions 120 works by him. For the account of Mulla Muhsin’s life and writings, consult also *Qisas al-‘Ulama‘*, pp. 322 - 33, and *Riyad al-‘Arifin*, pp. 388 - 89.

85. Mulla Muhsin Faid, *A‘inih-i Shahi*, Musawi Press, Shiraz, 1320/1902, p. 5.

86. *Kalimat-i Maknunah*, Teheran, lithographed edition, 1316/1898. Henceforth, our reference to this work will be to this edition.

87. *Ibid.*, p. 15.

88. For an explanation of these terms see Seyyed Hossein Nasr, "Being and Its polarisation," *Pakistan Philosophical Journal*, Vol. 3, No. 2, October 1959, pp. 8 - 13. In the general discussion among the Hakims as to whether these essences (or Being) are principal, Mulla Muhsin sides with the school of isalat-i wujud, the principality of Being, and considers the mahiyat to be the accidents of Being. This question has been dealt with in the chapter of Suhrawardi Maqtul.

89. *Kalimat-i Maknunah*, pp. 31ff. Mulla Muhsin describes these stages also as the 'ilm al-yaqin, in which one "sees" nothing but the divine essence names, and acts; the 'ain al-yaqin, in which one "sees" nothing but the essence and names, and the haqq al-yaqin in which there remains only the divine ipseity.

90. See T. Burckhardt, *Introduction to Sufi Doctrine*, pp. 64ff.

91. This term should not be taken in its negative connotation; it has a positive meaning in Sufi cosmology and marks an intermediate stage between the sensible world and the spiritual world. See H. Corbin, *Imagination creatrice...*, Chap. 2.

92. *Kalimat-i Maknunah*, p. 61.

93. *Ibid.*, pp. 74 - 75.

94. *Ibid.*, pp. 167ff.

95. *Ibid.*, pp. 214 -19.

96.

Raihanat al-Adab, vol. 3, pp. 460 - 62. The *Mar'at al-Ahwal-i Jahan Numa'* by Ahmad ibn Mohammad Baqir Ispahani Bihbahani is devoted to his life and works.

97. For the writings and life of the second Majlisi, see *Raihanat al-Adab*, vol. 3, pp. 455 - 60; *Danish Pazuh, Fihrist...* vol. 5, p. 1137. The *Faid-i Qudsi* by Mirza Hussain Nuri is devoted completely to his life and writings. Majlisi wrote 13 Arabic and 55 Persian books with altogether occupy nearly a million and a half lines.

98. He devoted a treatise, the *'Itiqadat*, to rejecting Sufism.

99. Sheikh Ahmad is responsible for the last important religious movement within Shi'ism and should be studied separately as a founder of a particular sect. The leaders of this sect called the Sheikhs claim to have knowledge of all things, and so each of them from the time of Sheikh Ahmad to the present has composed a large number of treatises on all the sciences., For a list of the works of Sheikh Ahmad and other leaders of the Sheikhs, see Abu al-Qasim ibn Zain al-'Abidin ibn Karim, *Fihrist-i Kutub-i Marhum- Ahsu'i wa Sa'r-i Mashayikh-i 'Izam*, two vols. Sa'adat Press, Kerman, 1337,Solar.

Chapter 48: Sadr al-Din Shirazi

Sadr al-Din Shirazi (Mulla Sadra)¹

A. Life and Works

The intellectual activity revived in Persia during the Safawid period, some features of which we have discussed in previous chapters, “The School of Ispahan,” found its culmination in Sadr al-Din Shirazi known to his compatriots as Akhund Mulla Sadra and to his disciples as simply Akhund or as Sadr al-Muti’allihin, i.e. the foremost among the theosophers. This figure, about whom the whole intellectual life of Persia has revolved in the past three and half centuries and who is one of the major expositors of Islamic intellectual doctrines in the Shi’ah world, has remained until today almost completely unknown outside Persia, even in other Muslim countries. Many have heard of his name, and nearly all travellers to Persia since the Safawid period, who have been interested in the intellectual life of the country, have recognized his importance have been impressed by his fame,² yet no one outside a group of his disciples in Persia, who have kept his school alive until today, has done justice to his doctrines in presenting them to the world at large.

Mulla Sadra, whose complete name is Sadr al-Din Mohammad, was born in Shiraz in about 919/1571,³ the only son of Ibrahim Shirazi. A member of the famous Qawam family of Shiraz, Ibrahim held the post of a vizier and was a powerful political and social figure in his native city. The young Sadr al-Din exhibited his exceptional intelligence from childhood and was given the best possible education in Shiraz.

Having completed his early studies, he became intensely interested in the intellectual sciences (al-‘ulum al-‘aqliyyah), especially metaphysics, and, therefore, left Shiraz for Ispahan which was at that time the capital and major seat of learning in Persia. In Ispahan he studied first with Baha’ al-Din ‘Amili, learning the transmitted sciences (al-‘ulum al-naqliyyah) from him and later with Mir Damad who was his most famous master in the intellectual sciences.⁴ Within a few years he became himself a recognized master in all the branches of formal learning especially in Hikmat⁵ in which he soon surpassed his own teachers.

Not satisfied simply with formal learning, Mulla Sadra left the worldly life in general and retired to a small village named Kahak near Qum where he spent 15 years in asceticism and purification of his soul until, as he claims in his introduction to the Asfar, he became endowed with the direct vision of the intelligible world. He now came to “see” through illumination (ishraq) what he had previously learned theoretically from books.

Having reached both formal and spiritual perfection, Mulla Sadra returned once again to the world. Meanwhile, Allahwirdi Khan, the Governor of Shiraz, had built a large madrasah and invited Mulla Sadra to return to Shiraz as the head of the new school. Akhund accepted the offer and returned to his native city, making the school of Khan the major centre of intellectual sciences in Persia.⁶ He remained there until the end of his life spending the last period of his terrestrial existence entirely in teaching and writing.

Despite his extreme piety which is shown by the fact that he made the pilgrimage to Mecca seven times on foot - he died in Basrah in 1050/1640 during the seventh journey - Mulla Sadra was often molested by some of the exoteric 'ulama' who could not accept his gnostic interpretation of the doctrines of the faith and who denounced him publicly on more than one occasion. It was only the influence of his powerful family that made it possible for him to continue his teaching activities.

Mulla Sadra's life, then, can be divided into three distinct periods: the period of childhood and schooling in Shiraz and Ispahan, the period of asceticism near Qum at the end of which the composition of the *Asfar* was begun, and the period of teaching and writing which represents the result and fruition of the other two periods. His life is itself the testimony of one of the main aspects of his wisdom, that in order to be effective theoretical knowledge must be combined with spiritual realization.

The writings of Mulla Sadra, nearly all of which were composed in the last period of his life, are almost without exception of great merit and have been among the main sources from which the later generations of theologians, philosophers, and gnostics have drawn their inspiration. All his writings concern religious sciences or metaphysics, theodicy or *Hikmat*,⁷ and are in a very clear and fluent style making them more easily understandable to the reader than the writings of his predecessors like Mir. Damad.⁸ Since Mulla Sadra's writings are nearly completely unknown outside Persia, we take this opportunity to list the works which, according to the leading living authorities and the best historical evidence, were written by him.⁹

The works dealing with metaphysics and intellectual sciences include: *al-Asfar al-Arba'ad*, *al-Mabda' w-al-Ma'ad*, *Sirr al-Nuqtah* (possibly not authentic), *al-Shawahid al-Rububiyah*, his most lucid and masterly work, *al-Hikmat al-'Arshiyah*, glosses upon the *Hikmat al-Ishraq* of Suhrawardi Maqtul, commentary (sharh) upon the *Hidayah* of Athiri,¹⁰ glosses upon the metaphysical parts of *ibn Sina's Shifa'*, *Fi Ittihad al-'Aqil w-alMa'qul*, *Fi Ittisaf al-Mahiyyah w-al-Wujud*, *Fi Bad' Wujud al-Insan*, *Fi al-Tasawwar w-al-Tasqid*, *Fi al-Jabr w-al-Tafwid*, *Fi Huduth al-'Alam*, *Fi Hashr*, *Fi Sarayan al-Wujud*, *fi al-Qada' w-al-Qadar*, *Fi Tashakhkhus*, *al-Masa'il al-Qudsiyyah*, *Iksir al-'Arifin*, *al-Waridat al-Qalbiyyah*, *al-Qawa'id al-Malakutiyyah*, *Hall al-Mushkilat al-Falakiyyah*, introduction to *'Arsh al-Taqdis* of Mir Damad, *al-Mazahir*, glosses upon *Rawashih al-Samawwiyyah* of Mir Damad, *Khalq al-A'mal*, *Kasr al-Asnam al-Jahiliyyah*, *al-Mizaj*, *al-Ma'ad al-Jismanim*, *Tanqiyah in logic*, diwan of poems in Persian, and answers to various questions on philosophy.

The works that are primarily concerned with the religious sciences include the Qur'anic commentary: *Mafatih al-Ghaib*, *Asrar al-Ayat*, commentary upon a large number of the verses of the Qur'an, commentary upon a few prophetic Ahadith fi Imamah, glosses upon the Qur'anic commentary of Baidawi, glosses upon the Khwaja Nasir al-Din al-Tusi and upon Qushji's commentary upon the *Tajrid* (of doubtful authenticity), glosses upon the commentary of the Lum'ah, commentary upon the *Usul al-*

Kafi of Kulaini, one of the four major sources of Shi'ah Law,¹¹ Mutashabih al-Qur'an, and a Persian treatise called Sih Asl on the soul and its destiny.¹²

Mulla Sadra composed also several quatrains in Persian, a few of which are mentioned in the traditional sources and some appear in his own handwriting on the first page of his commentary upon the Hidayah.¹³ They deal mostly with the Sufi doctrine of the unity of Being (wahdat al-wufid), which may be considered to be the central theme of Mulla Sadra's doctrinal formulations. For example, in one of the quatrains he says,

The Truth is the spirit of the universe and the universe of the body,
And the orders of the angels are the senses of the body,
The heavens, elements, and compounds are its organs,
Lo! Unity is this, and the rest nothing but rhetoric.

In dividing the writings of Mulla Sadra into the intellectual and the religious ones, we do not in any way wish to imply that these two categories are completely separated in his view. On the contrary, one of the major achievements of Mulla Sadra consisted in uniting and harmonizing religion and the intellectual sciences. All of his works, even in philosophy, are replete with the Qur'anic verses in support of his conclusions, and all of his religious works, even the Qur'anic commentaries, are full gnostic and intellectual interpretations. One can only say that some of Akhund's writings are concerned more with religious questions and others more with intellectual ones.

Likewise, among the above-mentioned works some are more gnostic in character and others are presented in a more discursive language, although they all bear the fragrance of gnostic doctrines. Among writings which are of a more gnostic vein one may mention al-Shawahid al-Rububiyah, al-'Arshiyah, Asrar al-Ayat, and al-Waridat al-Qalbiyyah, and among those which are presented in a more discursive language are the Sharh al-Hidayah and the commentary upon the Shifa'.

Without a doubt the most important work of Mulla Sadra is the Asfar al-Arba'ah. It is comparable in dimension and scope to the Shifa' and the Futuhat al-Makkiyyah and in a way stands midway between the Peripatetic encyclopedia of ibn Sina and the compendium of esoteric sciences of ibn 'Arabi. The title of Asfar itself has been the cause of much difficulty to the few Orientalists who are acquainted with the book. The word Asfar is the broken plural for safar meaning journey as well as sifr meaning "book" from the Hebrew sefer. So it was that Gobineau considered the work to be a series of four books."¹⁴

Both views are, however, erroneous. Actually, asfar means journeys but not the account of travels in the ordinary sense of the word as Gobineau understood it to be. As Mulla Sadra himself mentions in his introduction to the book, the Asfar consists of the following four stages or journeys of initiatic realization (suluk): (1) the journey of the creature or creation (khalq) towards the Creator or the Truth (Haqq), (2) the journey in the Truth with the Truth, (3) the journey from the Truth to creation with the Truth, and (4) the journey with the Truth in the creation. This monumental work is, therefore, an account of the stages of the journey of the gnostic, systematized in a logical dress.

In content, the first book of the Asfar deals with Being and its various manifestations, the second with the simple substances, i.e. the intelligences, souls, and bodies and their accidents including, therefore, natural philosophy, and the third with theodicy, and the fourth with the soul, its origin, becoming and end. All these topics are treated in detail taking into account the voluminous.¹⁵ In a sense, this vast opus is the culmination of a thousand years of contemplation and thought by Muslim sages as well as the foundation of a new and original intellectual perspective which issues forth from within the matrix of the Muslim tradition.

B. Sources of Mulla Sadra's Doctrines

According to Mulla Sadra, there are two forms of knowledge: that derived from formal instruction (al-'ilm al-suwari) and that which comes from intellectual intuition (al-'ilm al-ladunni). The first is acquired in school with the aid of a teacher, and the second based upon a greater degree of certainty than the first, is the science possessed by the prophets and saints through the purification of the soul and the catharsis (tajrid) of the intellect.¹⁶ There are then, according to this view, two sources for Mulla Sadra's ideas, one formal and in a sense historical, i.e. manifested in history before him, and the other spiritual and invisible. Regarding this second source, which may be called his "guardian angel" or "hidden Imam," the source of all inner illumination, we have little to say except to emphasize its importance in Mulla Sadra's view.

It was the first category that we are primarily concerned here. There are five principal elements which are clearly detectable in the new analysis brought about by Mulla Sadra; they are also found, though less explicitly, in the doctrines of the Safawid sages before him. These elements include the philosophy of Aristotle and his followers, the doctrines of the Neo-Platonic sages, especially Plotinus whose Enneads the Muslims considered to be a work of Aristotle, the teachings of ibn Sina, the gnostic doctrines of ibn 'Arabi, and the principles of the Islamic revelation, especially the more esoteric teachings of the Prophet and the Shi'ah Imams.¹⁷

Among these sources the last two are of particular importance. Mulla Sadra created a new school of Hikmat, on the one hand, by putting the intuitions of the gnostics and especially of ibn 'Arabi and his followers into a logical dress and, on the other hand, by drawing out the philosophical and metaphysical implications of the teachings of the Imams especially as contained in the Nahj al-Balaghah, creating thereby for the first time what may be called a distinctly Muslim school of Hikmat based especially upon the inspired doctrines which form the very basis of Shi'ism.

Mulla Sadra, like Suhrawardi, held in great esteem the pre-Socratic philosophers and sages of Greece, both historical and mythological, and regarded Thales, Anaximander, Agathedemon, Empedocles, Pythagoras, Socrates, Plato, and Aristotle as the last group of sages in the ancient world to have possessed wisdom in its entirety. He, like many other Muslim Hakims, considered Greek philosophy not to have started with Aristotle but to have ended with him and believed all the later Greek sages to have been masters of various arts and sciences other than metaphysics.¹⁸

For Mulla Sadra, therefore, Greek philosophy was essentially the wisdom of the Hebrew prophets inherited, systematized, and later in part forgotten by the Greeks, a wisdom which was integrated into the Muslim intellectual perspective and brought to full fruition in the light of the Islamic revelation. That is why Mulla Sadra wishes to reject some aspects of the teachings of either the Peripatetics or the Illuminationists he appeals so often first to the Qur'an and the Hadith and then to those fragmentary sayings of the pre-Socratic philosophers with which the Muslims were acquainted.

C. Mulla Sadra's Method and the Characteristics of His School

The particular genius of Mulla Sadra was to synthesize and unify the three paths which lead to the Truth, viz. revelation, rational demonstration, and purification of the soul, which last in turn leads to illumination. For him gnosis, philosophy, and revealed religion were elements of a harmonious ensemble writings. He formulated a perspective in which rational demonstration or philosophy, although not necessarily limited to that of the Greeks, became closely tied to the Qur'an and sayings of the Prophet and the Imams, and these in turn became unified with the gnostic doctrines which result from the illuminations received by a purified soul.¹⁹

That is why Mulla Sadra's writings are a combination of logical statements, gnostic intuitions traditions of the Prophet, and the Qur'anic verses. Through the symbolic interpretation of the sacred text he demonstrated the gnostic quality of the esoteric meaning of revelation and through intellectual intuition he made rational and discursive thought subservient to the universal truths of gnosis. In this fashion he achieved that synthesis of science and revelation in the light of gnosis and in the general perspective of Islam towards which Farabi and ibn Sina - the latter particularly in his Qur'anic commentaries - had aimed and which Ghazli, Suhrawardi and the whole chain of sages extended from the Saljuq to the Safawid period had sought to achieve from various points of view.²⁰

In metaphysics or, more generally speaking, Hikmat itself, Mulla Sadra is credited with founding the third major school of Muslim "philosophy," the first two being the Peripatetic school, the greatest exponent of which in the Islamic world was ibn Sina, and the Illuminationistic or ishraqi school founded by Suhrawardi Maqtul.²¹ Mulla Sadra adopted certain principles from each school as, for example, the hylomorphism from the Peripatetics and the gradation of Being and the celestial archetypes from the Illuminationists. Moreover, he added certain principles drawn from the teachings of the Sufis like ibn 'Arabi such as the continual becoming of the substance of the world and unity of Being which had never appeared as principles of any school of Hikmat and were never systematized in the logical language of the Hakims before Akhund's time. That is why Mulla Sadra is often credited with founding a new and original form of wisdom in the Muslim world is usually called al-Hikmat al-Muti'aliyyah as distinguished from al-Hikmat al-Masha'iyah (Peripatetic philosophy) and al-Hikmat al-Ishraqiyyah (Illuminationist theosophy).²²

D. Division of the Sciences

Before discussing the basic features of Mulla Sadra's doctrines it is useful to consider his conception of the relation of the sciences to one another and especially the meaning and significance accorded to Hikmat. In the introductory chapter of the *Asfar*, he divides the sciences, following the Peripatetics, into theoretical wisdom consisting of logic, mathematics, natural philosophy, and metaphysics and practical wisdom consisting of ethics, economics and politics.²³

In the treatise *Iksir al-'Arifin*, he outlines a somewhat more complete and in a way more original division of the sciences.²⁴ According to this scheme, the sciences ('ulum) are either of this world (*dunyawi*) or of the other (*ukhrawi*). The first is divided into three categories: the science of words ('ilm al-aqwal), the science of acts ('ilm al-af'al) and the science of states of contemplation or thought ('ilm al-ahwal or afkar).

The science of words comprises the sciences of the alphabet, word-construction, syntax, prosody, poetics, and the meanings of terms in logic. The science of acts consists of what belongs to various material objects from which the arts of weaving, agriculture, and architecture come into being, what is of a higher degree such as the art of writing, the science of mechanics, alchemy, etc, what belongs to providing a living for the individual and the society from which the sciences of family, law, politics, and the Shari'ah are created, and, finally, what belongs to the acquisition of spiritual and moral virtues and the casting away from evil from which the "science of the path" ('ilm al-tariqah), i.e. Sufism, comes into being. As for the science of thought, it consists of the sciences of logical demonstration, the science of arithmetic, the science of geometry including astronomy and astrology, and the sciences of nature including medicine and the various sciences dealing with minerals, plants, and animals.

The sciences of the other world which are not accessible to the ordinary intelligence of men and are not destroyed with the death of the body include the knowledge of angels and intellectual substances, the knowledge of the Preserved Tablet (*lauh al-mahfuz*), and the knowledge of the Exalted Pen (*al-qalam al-a'la*), i.e. of the divine decree and of the first determination of the divine essence which Mulla Sadra, following the earlier Sufis, calls also by the name of the reality of Mohammad (*al-haqiqat al-Mohammadiyah*). These sciences also include the knowledge of death, resurrection, and all that pertains to life hereafter.²⁵

Among the pursuits with which man can occupy himself in this life, none stands in as exalted a position as Hikmat the divisions of which we have outlined above. And among its branches none is as important and principled as metaphysics or the science of the principle of things, so that this branch of knowledge alone is often considered worthy of being called Hikmat. Mulla Sadra defines this science as "coming to know the state of the essence of beings as they are, to the extent of human capacity" or " a man's becoming an intellectual world (microcosm) corresponding to the objective world (macrocosm)," or, to quote still another definition, "the comprehension of universals and catharsis from the world of matter."²⁶

The above definitions imply that Hikmat is a purely intellectual form of knowledge in which the knower himself undergoes a certain transformation

in the process of knowing and his soul becomes a mirror in which the cosmic hierarchy is reflected. With such a conception then it is no wonder that Mulla Sadra spent so much of his life in teaching and writing about Hikmat only and regarded all the other sciences as its subsidiaries.

E. Principles of Mulla Sadra's Doctrines

In discussing the basic principles of Hikmat as understood and expounded by Mulla Sadra, we have chosen to mention those major principles of his thought which distinguish him from his predecessors and which are the characteristic elements of his metaphysics. The doctrines of the Peripatetic and Illuminationistic schools as well as the ideas of ibn 'Arabi and his followers form the common background for the metaphysics of Mulla Sadra.

There are four topics in each of which Mulla Sadra has departed from earlier philosophical perspectives and which form the principles of his whole intellectual vision. These four subjects concern (1) being and its various polarizations, (2) substantial motion or the becoming and change of the substance of the world, (3) knowledge and the relation between the knower and the known, and (4) the soul, its faculties, generation, perfection and final resurrection. We shall consider these questions in the above mentioned order, emphasizing in each case the particular complexion given to these subjects by Mulla Sadra.

1. Unity and Polarization of Being

The cornerstone of Mulla Sadra's doctrines is the principality and the unity and gradation of Being. As we have already mentioned,²⁷ one of the major points of contention among Muslim philosophers and theologians concerned the question whether Being or the quiddities (mahiyat) of things are principal. We saw that the Muslim Peripatetics like the Sufis believed in the principality of Being, i.e. the objective reality of Being independent of mental abstractions and considered the quiddities to be nothing but accidents, while the Illuminationists beginning with Suhrawardi Maqtul and followed by Mulla Sadra's own teacher, Mir Damad, developed a "metaphysics of essences" and held the opposite view that existence is an accident and that the essences are principal. In this debate Mulla Sadra sided definitely with the Peripatetics and Sufis in accepting the principality of Being, and opposed the Illuminationists.

On the question of unity and gradation of Being, however, Mulla Sadra departed from peripatetic teachings completely. In the view of the Muslim Peripatetics the being of each thing is in essence different and distinct from other beings while it is principal with respect to its own quiddity. According to Akhund, however, Being is the same reality in all realms of existence, it is a single reality but with gradations and degrees of intensity. Just as we say the light of the sun, the light of a lamp, or the light of a glow-worm and mean the same subject, i.e. light, but with different predicates, i.e. under different conditions of manifestation, so in the case of Being, the being of God, of a man, of a tree, or of a heap of earth are all one Being or one reality but in various degrees of intensity of manifestation.²⁸

Moreover, Being, no matter where it manifests itself, appears always with its attributes or armies ('asakir), as they are traditionally called, such as knowledge, will, power, etc.²⁹ A stone, because it exists, is a manifestation of Being and, therefore, has knowledge, will, power, and intelligence like men or angels. However, since at the level of a stone the manifestation of Being is very weak, these attributes are hidden and not perceptible.³⁰

The various beings in the world of manifestation are limitations of the one reality or Being. These limitations are abstracted by the mind and become the forms of quiddities (mahiyat) of things, and when transposed into the principle domain, they become the Platonic ideas or archetypes. Unlike Being which is objectively real and in fact is the reality of the cosmos, the mahiyat are accidents of Being abstracted by the mind without having a reality independent of Being. Even the archetypes (al-a'yan al-thabitah) possess a form of Being which in this case is God's knowledge of them.

What distinguishes the earthly manifestation of things from their celestial archetypes is not a gradation of the mahiyat from more subtle to more gross modes of existence, as certain followers of the Illuminationist school believe. Rather, it is the intensity of Being which determines the level of existence of each creature. If the light of Being shines upon the form or quiddity of a man with a greater intensity than now, he will become the man of the intermediate world (barzakh) and if the intensity is greater still he will become the celestial man identified with his heavenly archetype.

Absolute Being itself, which is the proper subject for metaphysics, is above all limitations and, therefore, above all forms or mahiyat, above all substances and accidents. It is the "Form of forms" and the Agent of all acts. By manifesting Itself longitudinally (tuli) It brings into being the various orders of Being from the archangels to terrestrial creatures and by manifesting itself latitudinally ('ardi) It creates the various members of each order of Being.³¹ Being is the reality of all things so that the knowledge of anything is ultimately the knowledge of Its being and, therefore, of Being itself. Likewise, the archetypes exist eternally through God's knowledge without which they would have no share whatsoever in Being.

Since Being is unity in multiplicity and multiplicity in unity,³² it partakes of logical distinctions and divisions while remaining in essence indivisible and above all polarizations. Mulla Sadra goes into great detail about the various divisions and categories of Being and in fact most of the first book of the Asfar is concerned with them. We mention here a few of the division which Akhund discusses with great rigour in his writings, especially in the monumental Asfar.

One division of Being is into connective being (al-wujud al-irtibati) and self-subsistent being (al-u'ujud al-nafsi). Connective being is that which connects a subject with a predicate as in the statement, "Man is a rational animal." Self-subsistent being is one which stands independently by itself and is not simply the means of connecting two terms. This category of being which exists in itself is in turn divided into three kinds: that which is objective existence is not the quality of something else and is called substance (jauhar), that which is the quality of something else and is called

accident (‘ard), and, finally, that which has need of no cause outside itself, i.e. the Being of God. From another point of view Mulla Sadra considers the being of all things other than God to be the connective being (wujud al-rabit) and only the Being of God to be Being per se.³³

Another division of Being adopted by Mulla Sadra is that of the necessary (wajib), possible (mumkin), and impossible (mumtani‘) beings which nearly all the Muslim philosophers and many theologians coming after ibn Sina and following his example, have accepted.³⁴ If the intellect considers a being and finds that the meaning of being is essential to it, i.e. lies in its essence, and that there are no causes outside it which have brought it into being, that being is called the Necessary Being. If it has need of a cause outside itself it is called possible being. Moreover, the attribute of possibility pertains to its quiddity as well as to its being. The possibility of its quiddity concerns its relation to its particular being, and the possibility of its being pertains to its relation to the Necessary Being. The being or existence of each object, therefore, depends upon the being of God and the knowledge of anything upon the knowledge of the root or principle of its own being. Since the root or basis of the Necessary Being is unknowable, the knowledge of the being of things remains also unknowable to us and it is only the quiddities or mahiyyat which we can know.

These quiddities, as already mentioned, are the limitations placed upon being and abstracted by the mind. The intellect in perceiving any object immediately analyses it into being and quiddity, the latter consisting of the limit determination of the former. It is only in the case of the Divine Being that such an analysis cannot be made because Absolute Being has no mahiyyah. One can say that It is without mahiyyah or that Its Being and mahiyyah are identical.

The quiddities in themselves are only mental concepts without a separate objective existence so that the effects produced by things come from their being and not from their quiddity. Likewise, cause and effect are categories of being which in one case becomes the cause and in the other the effect of things.

The mahiyyat are either particular or universal; the latter either exist before or are abstracted by the intellect from particulars.³⁵ The universals which exist independently of all particulars are the archetypes of Platonic ideas upon the reality of which Suhrawardi Maqtul had insisted against the view of the Peripatetics. Mulla Sadra likewise criticizes Aristotle and ibn Sina for considering the Platonic ideas to be nothing but the forms of things impinged upon the divine intellect. He insists upon the reality of the archetypes in a spiritual world that is completely independent of the world of particulars as well as of all mental images formed in the human mind.³⁶

Akhund praises Suhrawardi Maqtul and accepts fully the reasons he had given for the existence of the Platonic ideas or “masters of the species” (arbab al-anwa‘). There is a spiritual man in the spiritual world who is the real cause for the activities and ontological qualities of the terrestrial man; likewise in the case of other species each has an intelligible idea or archetype which governs all the activities and life of that species on earth.

The archetype is in essence one with its particulars but differs from them in characteristics which arise from the substance or “matter” of the particulars. The archetype appears different in each stage (taur) of manifestation while in the realm of reality it is one and the same truth. The beings of this world are the reflections and shadows of the archetypes so that they are like them and share in their reality and at the same time are different from them in being less real and farther removed from the source of Being.

One of the principles for which Akhund is famous is called imkan al-shraf or “the possibility of that which is superior.” According to this principle, just as each being in treading the path of perfection passes through various stages from the lowest to the highest, so it is necessary that for each imperfect being in this world there be degrees of being in the higher stages of the cosmic hierarchy, since each being has descended from the divine Principle through intermediate states of being. For example, the being of man on earth in his present state of imperfection necessitates the being of man in the intermediary world of souls, and the latter the being of the spiritual man in the intelligible world. According to this principle, therefore, the very existence of quiddities in their earthly state of souls or the world of inverted or reflected forms (al-amthal al-mu‘allaqah) and these in turn necessitate their existence in the spiritual world of simple intellectual substances.

After showing the mahiyyat are in reality limitations of being, Mulla Sadra goes on to assert that the logical distinction made by Aristotle and all the later philosophers between substance and the accidents which together form the ten categories concerns only the mahiyyat; Being properly speaking, is neither substance nor accident but above both. When we say of a thing that it is such and such a substance or that its particular quality and quantity are its accidents we refer only to its mahiyyah and not to its being.

The relation of cause and effect, however, contrary to that of substance and accidents, concerns only the being of things.³⁷ All things in the universe have a cause and an effect and since everything is a manifestation of Being, every effect is but an aspect of its cause and cannot in essence differ from it. That is why the well-known principle that from unity only unity can issue forth, *ex uno non fit nisi unum*, must be true. From the divine essence which is simple and one, only a simple being can issue forth. Mulla Sadra calls the first manifestation of the divine essence extended being (*wujud al-munbasit*), the first intellect, the sacred effusion (*faid al-muqaddas*) or the Truth of truths (*haqiqat al-haqa’iq*) which he considers to be one in essence but partaking of degrees and stages of manifestation.³⁸

He divides reality into three categories: of the divine essence, of “Absolute Being” which he identifies with extended being, and of relative being which that of the creatures is.³⁹ The cause of all things, therefore, is extended being which in turn the first determination of the divine essence. God is, thus, the Cause of causes and the Ultimate Source of all effects to be seen in the universe, because all causes and effects arise from the beings of things and all beings are in reality the stages of the One Being.

To terminate our discussion of the polarizations of Being in cosmic existence we must also consider the question of form and matter. On this question Mulla Sadra sides with the Peripatetics and is against the Illuminationists in accepting the theory of hylomorphism. In his view, however, matter is not limited to the corporeal domain. Rather, it is the aspect of potentiality which manifests itself in all the realms of existence according to the conditions of that particular realm. Bodies have a matter belonging to the corporeal world, and souls (anfas), a matter conformable to the subtle world of the psyche, moreover, in each world matter is a lower degree of being of the form with which it is united and for that reason accompanies it in all realms of existence until the highest realm which is the world of pure intelligences (mujarradat). That is why, as Akhund expresses it, matter has love for form which forever compels it to seek union with it (form). Only in the intelligible world, which is also called the 'alam al-jabarut, are the spiritual realities completely separated from and free of all species of matter, even the most subtle.

2. Substantial Motion

The question of potentiality leads to that of motion because motion, as Aristotle said, is becoming actual of that which is potential. Mulla Sadra rejects the possibility of sudden change from one substance to another which the Peripatetics accepted along with gradual change. Rather, he considers all change to be a form of motion and introduces the idea of substantial motion (al-harakat al-jauhariyyah),⁴⁰ which is another of the well-known principles associated with his name, as a basis of his whole outlook from which he goes on to prove the creation of the world in time, bodily resurrection and many other doctrines that will be discussed in the course of this chapter.

It is well known that the Muslim Peripatetics, following Aristotle, limited motion to only four of the ten categories, i.e. quantity (kam), quality (kaif), place (makan), and substance,⁴¹ the last understood only in the sense of generation and corruption. Ibn Sina rejected completely substantial motion in any sense other than instantaneous coming into being and passing away and argued that since the essence of a thing depends on its substance, if that substance were to change; its essence would also change and lose its identity.⁴²

Following the Sufis, Mulla Sadra considered the world to be like a stream of water which is flowing continually and believes motion to be nothing but the continuous regeneration and re-creation of the world at every instance.⁴³ According to him, it is not only the accidents but the substance of the universe itself that partakes of motion and becoming, i.e. continuous re-creation and rebirth.⁴⁴ In order to prove this assertion, Akhund makes use of several arguments. For example, he writes that it is an accepted fact that accidents have a need of a substance upon which they depend for their being and properties. Their subsistence depends upon the subsistence of their substance and their creation and regeneration upon its creation and regeneration. Therefore, every change which takes place in the accidents of a body must be accompanied by a corresponding change in the substance; otherwise the being of the former would not follow the being of

the latter. Or, in other words, since the effect must be the same as its cause, the cause or substance of a changing accident must itself be changing.

In addition, it is known that all beings in the universe are seeking perfection and are in the process of becoming and change in order to overcome their imperfections. Since divine manifestation never repeats itself, God creates new theophanies at every moment in order to remove imperfections and bring new perfections to things. The matter of each being, therefore, is continuously in the process of wearing a new dress, i.e. being wed to a new form, without, however, casting away its older dress. It is only the rapidity of this change that makes it imperceptible and guarantees the continuity and identification of a particular being through the stages of substantial motion.

According to Mulla Sadra, each body consists of matter and two forms: one, the form of the body which gives matter dimensions and the possibility of accepting other forms, and the other the form of the species (surah nau'iyah) which determines the species and identity of the body. Each of these two forms is at every instant changing, and matter is taking on new forms at every moment. Moreover, at each stage of substantial change the totality of a being which itself consists of form and matter may be considered to be the matter of the aspect of potentiality for the next stage the actualized aspect of which then becomes the form.

The power or force which motivates this change in nature which is a force hidden within the cosmic substance. In fact, since Being comes before nothingness, motion in this world comes before rest through the force immanent in the cosmos. Needless to say, this motion is limited to the degrees of cosmic existence in which matter is present, i.e. to corporeal and subtle manifestation, and does not extend to the world of pure intelligences or archetypes which are beyond all change.

Substantial motion itself has also the two aspects of change and permanence. Each form has two faces, one in the world of archetypes and the other in nature, the first permanent and the second in continuous renewal. The substance of the world itself is, therefore, the intermediary between permanence and change; it possesses two aspects, one which is continuously in motion and the other, which Mulla Sadra identifies with the intelligences, above all change.

Time, for Akhund as for Aristotle, is the quantity of motion, which, in a world of continuous substantial motion, becomes an inherent feature of cosmic existence.⁴⁵ It is, more specifically, the measure of the substantial motion of the heavens but not the measure of their rotation as held by the Peripatetics. The heavens, according to Mulla Sadra, are in continuous contemplation of the perfection of their beloveds, i.e. the universal intellects which at every instant cause a new form to be projected upon the essence of the universal souls. The cause of celestial motion is, therefore, the desire to reach perfection, a goal which, because of its limitlessness, makes celestial motion endless. The heavens are in continuous creative worship, their motion being a sign of their contemplation of the divine by means of the intelligences, and their causing generation and growth in nature through their illumination being a sign of their act of creation. The whole world,

therefore, both in its gross and subtle domains, partakes of substantial motion, and time is the measure of this motion as it occurs in the heavens where it is most regular as well as regulatory.⁴⁶

Mulla Sadra makes use of the principle of substantial motion to explain many of the most intricate problems of metaphysics and physics including the relation between permanence and change which we have already mentioned, the creation of the world, the creation of the soul, and various eschatological questions. This principle can, therefore, be regarded as one of the distinguishing features of his doctrinal formulation.

As to the question of creation Akhund opposes the simple creation ex nihilo of the theologians who believe the world to have been brought into being in time from utter nothingness. Likewise, he rejects the view of the Peripatetics who believe the world to have been created only in essences or in principio but not in time and the view of Mir Damad about al-huduth al-dahri.⁴⁷ Mulla Sadra believes that creation is in time (al-huduth al-zamani) because through substantial motion the being of the universe is renewed at every moment or, more explicitly; that the world is created at every instant, so that one can say that the being of the world depends upon its non-being at a previous moment. Where he differs from the theologians is that his conception of creation ex nihilo is complementary to the view that the archetypes of the world of creation exist changelessly in the intelligible world and that the world is connected with its divine origin through a permanent hierarchy.

This hierarchy begins with the first determination of the essence which Akhund, following the Sufis, calls the reality of Mohammad.⁴⁸ This is followed by the pure intelligences which are completely separated from matter and potentiality, the last of which is the giver of forms to the universe and the governor of the world of generation and corruption.⁴⁹ This last intellect is like a mill that grinds out new forms at every moment to feel the hyle of the world. It governs the world according to divine decree and gives revelation to prophets an inspiration to saints. Following the intelligible hierarchy there is the world of cosmic imagination or inverted or reflected forms or the purgatory between the intelligible and the material domains and, finally, the visible universe. The world is, therefore, created in time in the sense that its being is renewed after a moment in which it “was not”; at the same time it is the terminal state of an immutable hierarchy which through the subtle and angelic realms of being relates the visible cosmos to its divine source.

3. Divine and Human Knowledge

From what we have already said, it is clear that for Mulla Sadra knowledge forms the very substance of cosmic manifestation itself and is moreover the gate to and means of salvation for the soul. Like all other gnostics Akhund considers knowledge and being, or, from another point of view, the knower and the known,⁵⁰ to be essentially the same and identifies the being of things with God’s knowledge of them.⁵¹ God knows His own essence and His essence is none other than His being, and since His Being and essence are the same, He is at once the knower, the knowledge, and the known.

In the case of pure intellects or forms that are completely divorced from matter also, the intellect and the intelligible are the same, the difference in the two instances being that, although knowledge of the intellects is identical with their being, it is not identical with their quiddities, since their being surpasses their quiddities, whereas in the case of God's knowledge is identical both with Being and quiddity, since God's quiddity is the same as His Being.⁵²

Mulla Sadra rejects the Peripatetic notion that God's knowledge of things is the projection of their forms upon His essence as well as the idea followed by many Illuminationists that God's knowledge is the presence of the very forms of things in His essence. Rather, he uses the gnostic symbol of a mirror and considers the divine essence a mirror in which God sees the forms or essences of all things and in fact, through the contemplation of these forms or archetypes in the mirror of His own essence, He brings all things into being. Moreover, since the forms of all creatures, universal as well as particular, are reflected in His essence, God has knowledge of every particle of the universe.⁵³

Mulla Sadra divides knowledge ('ilm) into acquired (husuli) knowledge and innate (huduri) knowledge and, like the Illuminationists, divides the latter category into the knowledge of a thing in itself, of a cause of its effect, and of an effect of its cause. Perception is for him a movement from potentiality to actuality and an elevation in the degree of being in which the perceiver or knower rises from his own level of existence to the level of existence of that which is perceived through the union between the knower and the known which characterizes all intellection.

As for acquired knowledge or the knowledge of the human soul of things other than itself, it is not a reflection of the forms of things upon the soul and the soul does not have a passive role in the act of knowing. Rather, since man is a microcosm composed of all degrees of existence, his knowledge of things comes from the contemplation of these forms in the mirror of his own being much like divine knowledge with the difference that God's knowledge leads to objective existence (al-wujud al-'aini) of forms, while man's knowledge leads only to their mental existence (al-wujud al-dihni). Otherwise, man's soul has a creative power similar to that of God; its knowledge implies the creation of forms in the soul - forms the subsistence of which depends upon the soul as the subsistence of the objective universe depends upon God.⁵⁴

According to Mulla Sadra, mental existence or the presence in the mind of forms that yield knowledge of things as well as knowledge of itself is above the categories of substance and accidents and is identical with Being Itself. The knowledge that the soul has of things is just like the illumination of the light of Being. This knowledge established the form of that which is perceived in the mind, as Being establishes and manifests the forms and quiddities of things externally. Moreover, it repeats in an inverted order the degrees of cosmic manifestation. Just as cosmic existence originates from the divine essence through the world of the intelligences and consists of the degrees of cosmic souls, bodies, forms, and matter, so knowledge begins from the senses, then rises to the level of the imagination, apprehension, and

finally intellection ascending the scale of Being to the summit from which the whole of universal manifestation has descended.

4. Soul, Its Origin, Becoming and Entelechy

Another of the important changes which Mulla Sadra brought about in the formulation of Hikmat was the emphasis he laid upon the importance of psychology or the science of the soul ('ilm al-nafs) above and beyond what Peripatetic philosophy had accorded to it. Moreover, he removed the discussion of psychology from physics or natural philosophy and made it a branch of metaphysics and a study that is complementary to the science of the origin of things.⁵⁵

The soul (nafs), according to Mulla Sadra, is a single reality which first appears as the body (jism) and then through substantial motion and an inner transformation becomes the vegetative soul, then the animal soul, and finally the human soul. This development occurs from within the substance of the original body without there being any effusion from the heavenly souls or the active intellect.⁵⁶ The substance of the human sperm is at first potentially a plant, and then as it grows in the womb it becomes actually a plant and potentially an animal. At birth, it is actually an animal and potentially human, and finally at the age of adolescence it is actually human potential either an angel or a disciple of the devil.⁵⁷

All these stages lie hidden within the first substance or germ which through substantial motion traverses the degrees of being until it becomes completely divorced from all matter and potentiality and enjoys immortality in the world of pure intelligences.⁵⁸ The soul is, therefore, brought into being with the body but it has spiritual subsistence independent of the body.⁵⁹ Or, to be more precise, the soul at the beginning "is" the body which through inner transformation passes through various stages until it becomes absolutely free from matter and change.

The soul in each stage of its journey acquires a new faculty or set of faculties. As a mineral it has the faculty of preserving its form and as a plant, the faculties of feeding, growth, and the transformation of foreign substances into its own form. As an animal the faculties of motion and various forms of desire are acquired, and as a higher animal it develops in addition to the external senses the inner faculties of memory and imagination.⁶⁰ Finally, in man the five inner faculties: sensus communis (hiss al-mushtarik) which perceives forms, apprehension (wahm) which perceives meanings, fantasy (khayal) which preserves forms, memory (dhakirah) which preserves meanings and the double faculty of imagination (mutakhayyilah), and thought (mutafakkirah) which in the first case governs the sensible and in the second the intelligible domains, are also acquired.⁶¹

Throughout its development it is the same single soul which in one case appears as sight, in another as memory, and in yet another as desire. The faculties are not something added to the soul but it is the soul itself, or, in a more esoteric sense, being itself which appears in various forms in each case.⁶² The soul passes through this stream of becoming - this world - and the parts of its course are marked by the archetypes or Platonic ideas that distinguish one species from another. It wears a new dress and a new guise

at each point of the stream but the traveller is throughout one and the same.⁶³

Although the enumeration of the inner faculties of Mulla Sadra is essentially the same as that made by previous Muslim authors borrowing it from Aristotle, there is one point in which Mulla Sadra departs from the Peripatetics completely. It is well known that Aristotle considered only the universal intellect to be immortal and the Muslim Peripatetics like ibn Sina accorded immortality only to the intellectual part of the human soul. Mulla Sadra, following certain Sufi and hermetic teachings, asserts that the faculty of imagination enjoys also a form of immortality or at least existence independent of the body. He considers the universe to consist of three domains: the intelligible world, the sensible world, and an intermediate world (barzakh) of imagination which is macrocosmic as well as microcosmic.

The faculty of imagination in man as well as in some of the higher animals is, according to Akhund, a microcosmic counterpart of the cosmic imagination and has the power of creating forms. Upon the death of the body, this faculty, like the intellectual part of the soul, enjoys a form of life of its own and may in fact lead the soul to the intermediate world if it is the dominant element in the soul.

Mulla Sadra, like other Sufis, compares the soul to the cosmos on the one hand and to the Qur'an on the other, identifying the higher states of being of the soul with the esoteric meanings of the Qur'an.⁶⁴ There are seven degrees of existence for the soul as there are seven heavens and seven levels of interpretation of the Qur'an. These degrees he enumerates as nature (tab'ah), soul (nafs), intellect ('aql), spirit (ruh), secret (sir), hidden secret (khafi), and the most hidden state (akhfa) which is that of perfect union with God.⁶⁵ Each corresponds to a state of being, the totality extending from the life of nature or the senses to the divine life of union with God.

According to Mulla Sadra from another point of view the soul has two faculties, the practical ('amali) and the theoretical ('ilmi or nazari), which the latter at first is dependent upon the former but later becomes completely independent. The practical faculty consists of four stages: making use of the Law (Shari'ah) of various religions sent to guide mankind, purifying the soul from evil qualities, illuminating the soul with spiritual virtues and the sciences, and finally, annihilating the soul in God, beginning with the journey to God and then in God and finally with God.⁶⁶

As for the theoretical faculty it, too, is divided into four stages: the potential or material intellect ('aql al-hayulani) which has only the capability of accepting forms, habitual intellect ('aql al-malakah) which knows only simple and preliminary truths such as the truth that the whole is greater than its parts, the active intellect ('aql bi al-fi'l) which no longer has need of matter and concerns itself solely with intellect demonstrations and is either acquired or bestowed as a divine gift and finally the acquired intellect ('aql al-mustafad) which is the active intellect that has been united with the divine origin of all existence and is the highest degree attainable by man and the purpose of cosmic existence. These stages are also road-marks upon the path trodden by the soul without implying any form of multiplicity; the soul

remains the one traveller traversing all these stages on the road to perfection, the fruit and end of which is union with God.

Mulla Sadra deals with eschatology in great detail in many of his works and departs completely from the usual philosophical language in the treatment of this subject. His language is primarily that of the Qur'an and the hadith and of the gnostics. According to Akhund, the relation of this world to the next is like that of the mother's womb to this world. While the child is in the mother's womb he is actually in this world as well, but being separated from this world does not know of its existence. Likewise, man, while in this world is also in the next but the majority of people are unaware of the invisible world. Only the gnostics "see" the other world while they are here on Earth and that is because for them terrestrial existence has become transparent.

Akhund divides cosmic being into five classes each of which has a destiny and an end proper to its nature:⁶⁷ the pure intelligences separated from all potentiality, the intelligences which govern the heavens, the various psychic entities belonging to the world of the imagination such as the jinn and certain parts of the human soul, animal and vegetable souls, and, finally, minerals and elements. The separated intelligences subsist forever in the divine essence and are never separated from it. As for the rational soul (al-nafs al-natiqah), it is either perfect, as the souls of the heavens and of some men, and, in both cases, returns to God, or else it is imperfect. In the latter case it is either devoid of all desire for perfection as in the animals and those human beings who have committed much evil in this life, or it is desirous of perfection like many persons who, having chosen the wrong path, realize their mistake and wish to be guided towards the Truth.

In the former case the soul, like other psychic entities belonging to the intermediary world, after separation from the body becomes united with the forms of the intermediary world of imagination ('alam al-mithal);⁶⁸ in the latter case the soul suffers after its separation from the body until it is finally purified and united with God.

Plants are either used as food by men and animals and, therefore, share in their destinies, or have an independent existence, in which case, after the end of their terrestrial existence, they join their archetypes in the world of pure forms. Likewise with minerals and the elements, they too become united with their intelligible counterparts after their terrestrial existence terminates. In fact, these terrestrial beings are united with their archetypes even while they are on Earth, but only the gnostics are aware of this reality.

As for man's bodily resurrection on the Last Day, Mulla Sadra considers it to be one of the great mysteries of metaphysics revealed only to those who have reached the highest stage.⁶⁹ He accepts bodily resurrection which he interprets in a particular fashion. It is known that man's individuality and distinguishing characteristics come from his soul and not from his body because the substance of the body changes every few years without in any way destroying the unity of human beings. Of the faculties of the soul, however, intellection and imagination are innate to it, while the vegetative and animal faculties such as the external senses and passions are received by it through the body.

According to Akhund, in the next world all souls will receive the power to create external forms as prophets and saints do here in this world. For example, each soul can create the pleasure received through sight from within itself without the need of what appears to us here as an external organ. In other words, the organs of the body which appear as “external” to the soul are created from within the soul in the next world so that the resurrection of the soul is really complete with body according to all the meanings we can give to the word “body.”

Difference between paradise and hell lies in that the souls in paradise have the power to bring into being all the forms that are beautiful and pleasant, all the flowers and houris of paradise, while the impure souls in hell have only the power to bring into being ugly and unpleasant forms and are in fact forced to suffer by the very forms they will have created. Mulla Sadra adds, however, that ultimately the pains suffered in the inferno will come to an end and, as ibn ‘Arabi had said, the fires of hell will freeze and all will return to the divine origin of things.⁷⁰

F. Significance of Mulla Sadra and His Influence

As mentioned in the introduction to this chapter, the importance of Mulla Sadra lies not only in rekindling the lamp of learning and reviving the intellectual sciences fully for the first time in the Muslim World after the Mongol invasion, but also for uniting and harmonizing revelation, gnosis, and philosophy together. Some authors have criticized Mulla Sadra for taking certain principles from ibn ‘Arabi, Farabi, and Suhrawardi Maqtul and have, therefore, refused to accept his “originality.” But as Aristotle has said so justifiably, there is nothing new under the sun. One cannot create metaphysics of one’s own as if the metaphysics were a mechanical invention. The principles have always been and always will be the same. What determines the originality of author in a traditional civilization like that of Islam is his ability to re-interpret and reformulate the eternal verities in a new light and thereby create a new intellectual perspective.

Regarded in this way, Mulla Sadra must certainly be considered to be one of the most significant figures in the intellectual life of Shi‘ah Islam. Coming at a moment when the intellectual sciences had become weakened, he succeeded in reviving them by co-ordinating philosophy as inherited from Greeks and interpreted by the Peripatetics and Illuminationists before him with the teachings of Islam in its exoteric and esoteric aspects. He succeeded in putting the gnostic doctrines of ibn ‘Arabi in a logical dress. He made purification of the soul a necessary basis and complement of the study of Hikmat, thereby bestowing upon philosophy the practice of ritual and spiritual virtues which it had lost in the period of decadence of classical civilization. Finally, he succeeded in correlating the wisdom of the ancient Greek and Muslim sages and philosophers as interpreted esoterically with the inner meaning of the Qur’an.

In all these matters he represents the final stage of effort by several generations of Muslim sages and may be considered to be the person in whom the streams, which had been approaching one another for some centuries before, finally united.⁷¹

More specifically, Mulla Sadra was able to harmonize his doctrinal formulation with the teachings of Islam in such a way as to over-come all the major difficulties which the Peripatetic philosophers met in the face of the teachings of the Qur'an and for which al-Ghazālī criticized them so severely.⁷² Of particular significance was his divorcing metaphysics to a large extent both from Ptolemaic astronomy and Aristotelian physics. While in Europe, Galileo, Kepler, and Newton were destroying the homogeneity of Aristotelian cosmology and physics and in this way weakening the medieval Christian world-view which was closely linked with it, Mulla Sadra, through his doctrine of substantial motion and through considering the science of the soul to be independent of physics, separated metaphysics to a large extent from medieval natural philosophy.

This separation, although perhaps not of immediate significance in the 11th/17th century Persia, which was still immune from European ideas, became of great importance in the later centuries. As the modern scientific world-view became more and more accepted in Persia during the Qajar period, the separation brought about by Akhund between metaphysics and natural philosophy helped to preserve the traditional wisdom in the face of attacks by modernists whose only weapon was modern scientific theories connected with the world of matter. In this way also, Akhund rendered great service to the Muslim intellectual sciences and helped their preservation until today.

There is no doubt that nearly the whole of the intellectual life of Persia during the past three and half centuries has centred on Mulla Sadra. Of his immediate students, Mulla Muhsin Fa'id, 'Abd al-Razzaq Lahiji, and Qadi Sa'id Qumi, all of whom are among the leading figures of Shi'ah Islam, we need say little here for they have already been discussed in a previous chapter.⁷³ It need only be added that these men in turn produced a generation of students who extended the teachings of Akhund far and wide.⁷⁴ In the Qajar period, after a short interim of anarchy caused by the Afghan invasion, the school of Mulla Sadra was once again revived, the most famous of its members being Jaji Mulla Hadi Sabziwari, Mulla 'Ali Nuri, author of one of the most important commentaries upon the Asfar, Sheikh Ahmad Ahsai'i, founder of the Sheikhi movement and the commentator upon Mulla Sadra's Masha'ir, Mulla 'Ali Mudarris Zunuzi, author of a significant work Bada'i' al-Hikam in Persian and glosses upon the Asfar, and Mohammad Hidaji, also the author of a commentary upon the Asfar.⁷⁵

The influence of Akhund is to be met with wherever the traditional school of Hikmat is still preserved and taught in Persia.⁷⁶ All the adherents of this school have regarded Mulla Sadra as their master and it is no exaggeration to say that Akhund stands along with Farabi, ibn Sina, al-Ghazālī, Nasir al-Din Tusi, Suhrawardi Maqtul, and ibn 'Arabi among the principal formulators of the Muslim intellectual sciences and, though not well known outside Persia, is no less a figure than his more famous predecessor.⁷⁷ In him the many spiritual streams of the earlier centuries met and united in a new river which has watered the intellectual soil of Persia

during the past four centuries; his teachings are as alive today as they were at the time of their formulation.

Horten, Das Philosophische System des Schirazi, Strassburg, 1913.

Notes

1. This chapter has been written with the invaluable help of Hajj Mohammad Hussain Tabataba'i, one of the leading authorities on the school of Mulla Sadra in Iran today, the author of the 20-volume Qur'anic commentary al-Mizan and the editor and commentator of the new edition of the Asfar.

2. Comte de Gobineau, one of the most observant of travellers who has visited Persia during the past few centuries, was quite aware of Mulla Sadra's significance although not quite well acquainted with his ideas, for in a well-known passage he writes, "Le vrai, l'incontestable metite de Moulla Sadra reste celiui pue j'ai indique plus haut: c'est d'avoir ramine, rejeuni, pour le temps ou il vivait, la philosphie antique, en lui conservant les moins possible de ses forms avicenniques..." Gobineau, *Les religions et les philosophies dans l'Asie central*, Les Editions G. Gres et Cie, Paris, 1923, p. 102.

3. The date of Mulla Sadra's birth was unknown until quite recently when in preparing the new edition of the Asfar, Tabataba'i collected a large number of handwritten manuscripts of the work. On the margin of one of the manuscripts dated 1197/1782 with marginal notes by Mulla Sadra himself, the authenticity of which cannot be doubted, there appears this statement, "This truth was revealed to me on Friday, the seventh of Jamadi al-Ula 1037 A.H. when 58 years had passed from (my life)..." Therefore, the date of his birth can be established as 979/1571 or 980/1572.

For the traditional accounts of the life of Mulla Sadra and his works, see M.B. Khunsari, *Raudat al-Jannat*, Teheran, lithographed edition, 1306/1888, vol. 2, pp. 331 - 32; M.A. TABRIZI, *Raihanat al-Adab*, Sa'di Press, Teheran, 1331/1912, vol. 2, pp. 458 - 61; Mir Khwand, *Raudat al-Safa*, Teheran, lithographed edition, 1270/1853, vol. 8, p. 120; T. Tunikabuni, *Qisas al-'Ulama'*, 'Ilmi Press, Teheran, 1313/1895, pp. 329 - 33, and Agha Buzurg Tihrani, *al-Dhari'ah al-Gharra* Press, najaf, 1355/1936, on dealing with various writings of Akhund.

As for secondary sources see M. Mudarrisi Chahardihi, *tarikh-i Falasifih-i Islam*, 'Ilmi Press, Teheran, 1336 Solar, vol, 1, pp. 179ff; A. A. Zinjani, *al-Filsuf al-Farsi al-Kabir Sadr al-Din al-Shirazi*, al-Mufid Press, Damascus, pp. 212 - 18, no. 3, 1951, pp. 318 - 27; J. 'Ali Yasin, *Sadr al-Din al-Shrazi Mujaddid al-Falsifat al-Islamiyyah*, al-Ma'arif Press, 1375/1956, and the introduction by M.R. mazaffar, in the new edition of the Asfar, *Da'ir al-Ma'arif al-Islamiyyah*, Qum 1378/1958.

For an account of the life and doctrines of Mulla Sadra in European languages, see Gobineau, *op. cit.*, pp. 91 - 103; E. G. Browne, *A Literary history of Persia*, University Press, Cambridge, 1924, Vol. 4, pp. 429 - 30; and m. Horten, *Die Philosophie des Islam*, Verlag Ernst Rheinhardt, Munchen, 1924, pp. 57ff. Also Browne, *A year Amongst the Persians*, Adam & Charles, London, 1950, pp. 141 - 43.

4. Concerning Baha' al-Din 'Amili and Mir Damad, see the preceding chapter.

To know the names of the masters of a Hakim is important because learning Hikmat from "within" is impossible without a master for the majority of even of those who are gifted to pursue it. One can learn certain ideas from books alone but to really understand what Hikmat means and what the various authorities meant by various expressions there is a need of a master who himself learned the doctrines from another master and so on going back to the early masters. The Hakim is, therefore, as insistent upon the authenticity of his chain of masters as a verifier of hadith is about the ismad of a tradition or a Sufi master about the isilsilahi or chain of his tariqah.

5. We have already discussed in detail in previous chapters the meaning of this term as used here, i.e. a combination of gnosis, illuminationist and Peripatetic philosophy which is neither theology nor philosophy as currently understood but theosophy in the proper and original sense of the term and not in its present usurpation by various pseudo-spiritualist groups.

6. The Khan school which is one of the most beautiful edifices of the Safawid period had fallen into ruins for some years when about ten years ago the Bureau of Archaeology of the Persian Government undertook the task of repairing it. It is now operating once again as a madrasah for traditional learning.

7. He in fact criticizes ibn Sina for having spent his time composing works on other sciences like mathematics and medicine.

8. The story is told in most of the traditional sources mentioned above that Mulla Sadra once asked Mir Damad why he was respected by all the religious authorities while Akhund, despite his powerful family, was molested so much by some of the 'ulama'. Mir Damad answered that although they were both saying the same thing, he hid his ideas within so many difficult expressions that only the elite would be able to understand them while Mulla Sadra wrote so clearly that anyone with a knowledge of Arabic could detect the trend of his ideas.

9. See also Raihanat al-Adab, pp. 458 - 61, where 50 works by him are mentioned, and A. A. Zanjani, op cit., pp. 19 - 22 where he mentions 26 metaphysical and philosophical and 17 religious works some of which are of doubtful authenticity. Refer also to J. 'Ali Yasin, op. cit., pp. 58 - 62, where 26 works are named.

10. The Kitab al-Hidayah dealing with the complete cycle of Hikmat, i.e. logic, natural philosophy, and metaphysics was composed by the seventh/13th century Persian author, Athir al-Din Mufaddal ibn 'Umar al-Abhari, it soon became one of the basic books of instruction in the madrasahs. The tenth/16th century commentary upon it by Kamal al-Din Mibudi was the best known before Mulla Sadra composed his own commentary upon it.

11. The Usul al-Kafi was also commented upon by Majlisi as we have mentioned in the previous chapter. The commentary of Mulla Sadra which is of a more intellectual nature is one of the most important Shi'ah works written in the Safawid period and is perhaps his most significant religious composition.

12. The unpublished treatise the manuscript of which exists in the Majlis Library (MS. 103) in Teheran is the only known prose work of Mulla Sadra in Persian, all the other above mentioned writings being in Arabic.

13. The manuscript of the Sharh al-Hidayah in the Mishkat Collection at Teheran University, MS. 254, is in Mulla Sadra's own handwriting, several quatrains appear in the opening pages which are without doubt his own.

14. E.G. Browne, op. cit., vol 4, p. 430.

15. The 1282/1865 Teheran lithographed edition with the commentaries of Sabziwari on the margin runs over 1,000 large pages and the new edition by Mr. Tabatabai'i with running commentary by himself and several other Hakims of the Qajar period including Sabziwari and Mulla 'Ali Nuri is planned in nine 400-page volumes of which three have appeared so far. The Asfar which is used in graduate school of theological faculty in Teheran University is taught over a three year period and then only a part of the First Book is covered. It is said that Haji Mulla Hadi Sabziwari, the greatest Persian Hakim after Mulla Sadra, taught the complete Asfar to his advanced disciples over a six year period.

16. Mulla Sadra, Mafatih al-Ghaib, al-Miftah al-Thalith, al-Mashhad al-Thamin.

17. See the preceding chapter in which the formative elements of Shi'ah intellectual life leading to Mulla Sadra and of the Safawid sages have been discussed.

18. See Asfar, Teheran, lithographed edition, 1282/1865, Book 2, Section 4. Mulla Sadra writes that these pre-Socratic philosophers actually spoke in a symbolic language (ramz) and implied by their theory that the world was composed of a single element, the doctrine of the unity of Being or wahdat al-wujud which is the basis of the gnostic doctrines of ibn 'Arabi. Mulla Sadra, in fact, identifies the water of Thales with the nafas al-Rahman or the breath of the Compassionate which the Sufis consider to be the ultimate substance of the universe. These early Ionians who are considered by some today to be the founders of the modern quantitative sciences of nature appear to the Muslims in a different light as expositors of universal gnosis and those whom, as Mulla Sadra writes, "have adopted the light of Hikmat from the lamp of prophecy."

19. For an account of the relation of Mulla Sadra to Shi'ism and his success in unifying the three above-mentioned elements, see M. H. Tabataba'i, "Musahibih-i Ustad 'Allamih Tabataba'i ba Professor Henri Corbin dar Barih-i Shi'ah," Salanih-i Maktab-i Tashayyu', No. 2, 1339 solar, pp. 61 - 64. This is one of the most important works written recently by a Shi'ah authority on the general perspective of Shi'ism and the various sciences developed by the Shi'ahs, and is the result of a series of meetings between him and H. Corbin in which the latter posed several basic questions about the spiritual attitude of Shi'ism and the

relation between Shi'ism and Hikmat and Sufism. The book was written in answer to H. Corbin's questions and contains a wealth of precious knowledge about the intellectual life of Shi'ism.

20. It may at first seem surprising that Mulla Sadra wrote a treatise against those who called themselves Sufis. But if we consider the social and political conditions of the later Safawid period in which Sufism was greatly disdained by political authorities and much of it had become body without a soul, we can perhaps understand some of the motifs for Mulla Sadra's attack on it. However, the "Sufis" whom Mulla Sadra attacked were not the Sufis proper but those who were seeking to destroy the exoteric truths and bring about social anarchy in the name of esotericism that they themselves did not possess. Otherwise, there is not the least doubt of Mulla Sadra's connection with Sufism - although he preferred to use the name gnostic ('arif) rather than Sufi - nor can one doubt in any way to the gnostic quality of his doctrines.

21. See the chapter of Suhrawardi Maqtul.

22. If we have translated Hikmat as philosophy in one case and as theosophy in the other, it is because the meaning of the term includes both the wisdom belonging to the rational and mental plane or philosophy and the wisdom which transcends the level of the ordinary human mind and which, properly speaking, belongs to the angelic order and cannot be called philosophy as the term is currently understood in European languages.

23. See J. Muslib, *Falsafih-i 'Ali ya Hikmat-i Sadr al-Muti'allihin*, vol. 1, Unversity Press, Teheran, 1337 Solar, p. 3.

24. Sadr al-Din Shirazi, *Rasa'il*, Teheran, lithographed edition, 1302/1884, pp. 279 - 86.

25. Mulla Sara adds at the end of this discussion that the causes for the difference of view among various schools regarding different sciences are four in number: (1) differences in the science of unity leading to the creation of sects like the atheists, etc., (2) the science of prophecy leading to separation between Muslims, Christians, Jews, and other religious groups, (3) the science of Imamate leading to division between the Shi'ahs and Sunnis, and, finally, (4) the science of jurisprudence leading to the creation of various schools and interpretations of law. Mulla Sadra adds that the main cause of multiplicity lies in misunderstanding the science of unity and the science of the soul or the science of the beginning and end of things. *Rasa'il*, pp. 287 - 88.

26. J. Muslih, op. cit., pp 1 - 2.

27. See Chapter 19 on Suhrawardi Maqtul.

28. Mulla Sadra regards light as a perfect and intelligible example of the unity and gradation of Being and praises the Illuminationists on this point. See the first of the *Asfar*.

29. See Seyyed Hossain Nasr, "The Polarisation of Being," *Pakistan Philosophical Journal*, vol. 3, no. 2, October 1959, pp. 8 - 13.

30. The doctrine of the unity and gradation of Being in Mulla Sadra is not new, it was expressed clearly five centuries before him by ibn 'Arabi. Mulla Sadra, however, was the first person to give it a logical dress and introduce it as a principle of Hikmat as distinct from pure gnosis which does not concern itself with various logical distinctions.

31. In dividing the hierarchies of universal existence into longitudinal and latitudinal orders Mulla Sadra follows the scheme of ishraqi angelology, which was discussed in the chapter on Suhrawardi Maqtul.

32. What distinguishes the gnostics from the Hakims in this subject is that the former formulate the illuminations they receive which differ depending upon the degree of their inner realization. One gnostic in a certain state of contemplation (hal) may have been aware of only the creatures or multiplicity as a reflection of unity, another of only God or unity, and a third of unity in multiplicity. The Hakims, however, from a theoretical and more logical point of view, do not take particular perspective of the traveller upon the path (salik) into consideration and have even criticized some of the gnostics for considering multiplicity to be completely unreal.

33. By this latter distinction, Mulla Sadra implies the difference which exists, or at least used to exist, in European languages between Being and existence. All creatures exist but only in the case of God can one, properly speaking, say that He "is." See Seyyed Hossein Nasr "The Polarisation of Being," op. cit., pp. 8 - 13.

34. See ibn Sina, *Kitab al-Shifa' (Ilahiyyat)*, Teheran, lithographed edition, pp. 291ff.

35. The feature which distinguishes particulars from one another and determines all other qualities in them is, according to Mulla Sadra, their degree of being.

36. Mulla Sadra writes that it was Hermes who learnt about the truth of the "Platonic ideas" when he became illuminated by the light of the intelligible world and separated from the world of the senses. In this state Hermes met an illuminated figure in the spiritual world who taught him all the sciences and when he asked the figure who he was, the figure answered, "I am thy perfect nature (ana taba'aka al-tam)," Asfar, p. 121. For a study of the rich symbolism of "perfect nature," which means the celestial or angelic part of the human soul, see H. Corbin, "Le recit d'initiation et l'hermetisme en iran," *Eranos Jahrbuch*, vol. 17, 1949, pp. 121 - 88.

37. For the general discussion on cause and effect, see J. Muslih, *op. cit.*, pp. 85ff.

38. It is this "simple being" or the supreme intellect which the Sufis before Mulla Sadra identified with the reality of Mohammad. See ibn 'Arabi, *La sagesse des prophetes*, tr. T. Burckhardt, Albin Michel, Paris, 1955, pp. 181ff.

39. According to a principle - which is another of the well-known doctrines formulated by Mulla Sadra and is called *basit al-haqiqah kull of al-ashya'*, i.e., Truth in its state of simplicity contains all things - the divine essence in its state of simplicity and "contraction" contains all realities within itself. This is indeed a direct consequence of the principle of the unity of Being; it if there is but one Being and the whole universe is nothing but Being, the universe and all its realities are contained in a state of "contraction" in that One Being.

40. See J. Muslih, *op. cit.*, p. 100. This distinction may seem to differ from what was said previously. But it must be remembered that the divine essence cannot be limited to Being, which is its first determination as well as the principle of universal manifestation. It is this distinction to which Akhund is referring here.

41. Mulla Sadra placed a lot of emphasis upon this point that he discussed it not only in the First Book of the Asfar but in many other chapters of the work and nearly all of his other books as well. See also H. A. Rashid, *Dau Filsuf-i Sharq wa Gharb*, Parwin Press, Ispahan, 1334 Solar, pp. 50ff. and J. Muslih, *op. cit.*, pp. 128ff. Mulla Sadra in the second Book of the Asfar and other places insists that he is not the first among the Hakims to have introduced this idea but that the pre-Socratic philosophers had indicated although not explicitly the existence of substantial motion. Moreover, he gives the Qur'anic verses such as "Do ye create it or are We the Creator? We mete out death among you, and We are not to be outrun, that We may transfigure you and make you what ye know not" (51:59 - 61, Pickthall's translation) in support of his view.

42. See ibn Sina, *Danish-Nameh-i 'Ala'i (Tabi'iyat)*, University Press, Teheran, 1331/1912, pp. 3ff. Aristotle also in *De Generatione et Corruptione* (319b, 31 - 320a, 2) divides motion into the four categories of quantity, quality, place, and substance and speaks of substantial change as one of the processes which characterize the sub-lunary region. But the substantial change Aristotle means only generation and corruption and for that reason later Muslim philosophers did not even apply the term "motion" to it and considered motion to belong only to the categories of quantity, quality, locomotion, and posture.

Mulla Sadra, however, considers substantial motion to be an inner transformation of things somewhat in the alchemical sense in which there is not simply a coming into being and a passing away but a process through which a new state of being is reached. Moreover, substantial change for the Aristotelians is sudden and instantaneous while for Akhund it is gradual like other forms of motion. Also, substantial change in the Aristotelian sense is limited to the sublunary region, while for Mulla Sadra the whole of gross and subtle manifestation partakes of substantial motion. Akhund's conception of substantial change therefore cannot be identified with that of Aristotle and should not be confused with it because of similarity in terminology.

For an analysis of Aristotle's doctrine of motion, see also H. A. Wolfson, *Crescas' Critique of Aristotle*, Harvard University Press, Cambridge, 1929, pp. 512ff.

43. Ibn Sina, *Shafa' (Tabi'iyat)*, pp. 43 - 44.

44. The idea that God annihilates and re-creates the world at every moment is one that is shared by the majority of the Sufis. Jalal al-Din Rumi expresses it:

"Every moment the world is being renewed, and we

unaware of its perpetual change.

Life is ever pouring in afresh through the body
it has the semblance of continuity.”

R. A. Nicholman, Rumi, Post and Mystic, George Allen Unwin, London, 1950, p. 117.
See also T. Burckhardt, *Introductio to Sufi Doctrine*, tr. D. M. Matheson, Sheikh
Mohammad Ashraf, Lahore, 1959, chap. 4.

45. Substantial motion is essentially a rebirth because it always means the attainment of
a new state of Being.

46. From what we have said above it is clear that in Mulla Sadra's view motion is
principal, for it is an inherent characteristic of corporeal and even subtle existence, and time
is subservient to it contrary to the view of many previous philosophers who considered
motion to be subservient to time. Mulla Sadra's conception of time as the quantity of
substantial motion, which is itself the renewal of cosmic existence, bears much resemblance
to the doctrine of Abu al-Barakat al-Baghdadi for whom also time is the measure or
dimension of existences. See S. Pines, *Nouvelles etudes sur Awhad al-Zaman Abu'l*
Barakat al-Baghdadi, Librairie Durlacher, Paris, 1955, Chap. 2.

47. In Fasl 33 of the first book of the *Asfar*, Akhund writes that all bodies are limited
within the four dimensions of length, breadth, depth, and time, and are differentiated by the
division inherent in time, while their unity is preserved through celestial archetypes or
Platonic ideas.

48. See Chapter 47.

49. See Mulla Sadra, *al-Waridat al-Qalbiyyah*, *Rasa'il* pp., 243 - 49.

50. The world of change here as in the case of Suhrawardi Maqtul means the whole
visible universe and not only the sublunary region of the Aristotelians. According to Mulla
Sadra, the difference between the sublunary region composed of the four elements and the
heavens composed of ether lies only in that the matter of the heavens is more subtle than
the gross matter of the terrestrial environment and is governed by pure souls that are free
from the passions of earthly souls.

51. The principle that the intellect, intelligence, and the intelligible are one (*ittihad al-*
'aqil w-al-ma'qul) is another point in which Mulla Sadra opposed the previous Muslim
philosophers. This principle, which was accepted by the Neo-Platonists, was rejected by ibn
Sina (see *Isharat*, Haidari Press, Teheran, 1379/1959, vol. 3 pp. 292 - 93) and other
Peripatetics.

Akhund, while acknowledging his debt to Porphyry and earlier Greek philosophers (see
his *Rasa'il*, p. 319), considered himself the first among Muslims to have reinstated this
principle which is made a cornerstone of his intellectual edifice. Actually, Afdal al-Din
Kashani and before him Abu al-Hassan 'Amiri in his *Kitab al-Fursul fi al-Ma'alim al-*
Ilahiyyah had accepted this principle (see M. Minosie, "Az Kaza'in-i Turkiyyah," *Revue de*
la Faculte des Lettre, Universite de Teheran, vol. 4, no. 3, Mars 1957, p. 50) but it was
Mulla Sadra who first systematized this principle and demonstrated it clearly.

For a discussion of the principle of the union of the intellect and the intelligible, see
Asfar, pp. 277ff.

52. "God's knowledge of things is identical with their being" (Mulla Sadra, *al-*
Shawahid al-Rububiyyah, Teheran, lithographed edition, 1236/1820, p. 36).

53. See Mulla Sadra, *Sharh al-Hidayah al-Athiriyyah*, Teheran, lithographed edition,
1315/1897, pp. 308 - 09.

54. See his *Rasa'il* p. 240, where he quotes the Qur'anic statement that "not a particle of
dust in the heavens and earth is hidden from God's knowledge" as support and consequence
of his conception of divine knowledge.

55. Akhund adds that in the case of prophets and saints, the creative power of the soul
becomes so great that like God Himself it can even create objective and external forms.

56. The whole of the fourth book of the *Asfar* is devoted to the science of the soul
where the soul takes on a meaning totally different from the quasi-material substance of the
Aristotelians.

Mulla Sadra often speaks of the complete science of things as *mabda' w-al-ma'ad*, the
origin and end, and has even a book by this name. He identifies the science of *mabda'* with
theodicy and metaphysics and that of *ma'ad* with psychology and eschatology.

57. The view of Mulla Sadra regarding the growth and perfection of the soul resembles the alchemical view in which the power to reach perfection is considered to lie within matter itself and not outside it.

58. Mulla Sadra, *al-Shawahid al-Rububiyah*, pp. 152ff.

59. That is why Akhund writes that “the first seed of the universe was the intellect and the last stage is also the intellect which is the fruit of the same tree” (*ibid.*, p. 165.)

60. This principle which In Arabic is called *jismaniyat al-huduth wa ruhaniyat al-baqa'* is another of the doctrines for which Mulla Sadra is famous.

61. We have not enumerated these faculties in detail because Mulla Sadra follows the earlier Muslim authors especially *ibn Sina* on this point. See Chapter 66 on “Natural History” regarding the various faculties.

62. *Al-Shawahid al-Rububiyah*, pp. 134ff.

63. By emphasizing the immanent aspect of the development of the soul, Mulla Sadra does not forget the transcendent factor, for in the treatise *Iksir al-'Arifin* he writes the Arch-angel *Israfil* blows life into the body and gives it the power of sensation and motion, that *Mika'il* enables the body to assimilate food and sends it its sustenance, that *Jibril* gives it instruction regarding the revelation and acts of worship and finally that *'Izra'il* enables the soul to abstract forms from matter and to separate itself from the body. *Rasa'il*, pp. 306 - 07.

64. Concerning the traditional conception of cosmic becoming, see A. K. Coomaraswamy, “Gradation and Evolution,” *Isis*, 35, 1944, pp. 15 - 16; 38, 1947 - 48, pp. 87 - 94.

As for the unity of the soul which from the gnostic point of view is identified with the divine essence or self, see A. K. Coomaraswamy, “On the One and Only Transmigrant,” *Journal of the American oriental Society*, June 1944, No. 3, pp. 19 - 43.

65. According to a famous hadith of the Prophet, accepted by the Shi'ahs and the Sunnis alike, the Qur'an has seven levels of meaning the last known only God. It is from the esoteric interpretation of the revealed book that Mulla Sandra and Sufis before him have drawn the gnostic doctrines inherent and hidden in the Islamic revelation as they are in all other revelations.

66. *Iksir al-'Arifin*, *Rasa'il*, p. 295. This terminology is a very old in Islam, it was adopted by the early Sufis from the traditions of the Prophets and Imams.

67. *Al-Shawahid al-Rububiyah*, p. 140.

68. Mulla Sadra, *Risalah fi-al-Hashr*, *Rasa'il* pp. 341 - 58.

69. In the case of animals, after death they join the masters of their species (*rub al-nau'*) or archetypes except the higher animals who have the faculty of imagination developed in them. They have an independent existence in the world of cosmic imagination without, however, being distinct individually as in the case of people.

70. See Mulla Sadra, *al-Mabda' w-al-Ma'ad*, Teheran, lithographed edition, 1314/1896, pp. 272ff.

He criticizes both the naturalists who deny the existence of the soul after death and the Peripatetics who accept only the resurrection of the soul but not of the body.

71. This esoteric view expressed in his commentary upon the *Usul al-Kafi* as well as in the *Asfar* was one most attacked by the exoteric 'ulama'. The religious perspective which appeals essentially to the sentimental or passionate aspect of human nature must insist upon “eternal” punishment and reward in order to have its laws accepted in human society. Only the exoteric view meant for the saintly and appealing to the contemplative aspect of man, can take into consideration the relatively of heaven and hell with respect to the divine essence without in any way denying the reality of “eternity” of reward and punishment in the life hereafter with respect to human existence here.

72. For the background leading to Mulla Sadra, see chapter 47 on “The School of Ispahan in this work. See also Mulla Muhsin Faid, *al-Mahajjat al-Baida'*, vol. 1, *Islamiyyah Press*, Teheran, 1379/1959, introduction by Sayyid Mohammad Mishkat , pp. 10 - 23, in which the background leading to Mulla Sadra as well as the distinguishing principles of his own doctrines is discussed.

73. It will be remembered that *al-Ghazālī* in his *al-Munqidh min al-Dalal* considered the philosophers to be infidel on three points: their rejection of resurrection of bodies, their

limiting God's knowledge to universals, and their belief in the eternity of the world. See. W. Montgomery Watt, *The Faith and Practice of al-Ghazālī*, George Allen & Unwin, London, 1953, p. 37.

From what we have discussed of Mulla Sadra's doctrine it is clear that he accepted the resurrection of bodies, God's knowledge of particulars, and creation of the world in time though not quite in the sense as that of the theologians.

74. Mulla Sadra's doctrines were especially influential in India to which country one of his disciples by the name of Mohammad Salih Kashani migrated - after reaching a wild state of ecstasy during one Mulla Sadra's lessons -and where he attracted many disciples. The works of Mulla Sadra have continued to be taught in the Islamic schools of the Indian sub-continent, especially his *Sharh al-Hidayah* which came to be known by the author's name as Sadra. Many glosses have been written on it by various philosophers and scholars in India such as Mohammad Amjad al-Sadiqi (d. 1140/1727), Mulla Hassan al-Lakhnawi (d. 1198/1783), Mohammad A'lam al-Sindili (d. 1250/1834), and 'Abd al-'Ali Bahr al-'Ulum who lived in the 13th/19th century. Numerous manuscripts of these and other glosses on the *Sharh al-Hidayah* are to be found in such libraries as the Raza Library of Rampur and the Khuda Baskh Library in Patna (see the *Catalogue of Arabic and Persian Manuscripts in the Oriental Library at Bankiput*, vo. 20 (Arabic MSS), Bihar and Orissa, 1936, MSS. No. 2351, 2386, 2371 - 78).

75. See Chapter 47 on "The School of Ispahan."

76. For a list of the names of Mulla Sadra's disciples in the Qajar period, see Raihdnat al-Adab and Gobineau, op. cit., pp. 103ff.

77. Iqbal's statement that, "It is, moreover, the Philosophy of Sadra which is the source of the metaphysics of early Babism" (*Development of Metaphysics in Persia*, London, 1908, p. 175) is true only in a negative sense in the same way as the doctrine of the Rhenish mystics might be considered to be the source of the Protestant revolt during the Renaissance.

Part 5: Political Thought

Chapter 49: Ibn Khaldun

Chapter 49: Ibn Khaldun

A

The consideration of ibn Khaldun's political philosophy within the context provided by a work on the history of Muslim philosophy, and in a chapter concluding the history of Muslim political philosophy in the classical period, must face and attempt to clarify the complex problem of the precise character of the political aspect of ibn Khaldun's new science of culture, and its theoretical and practical implications when contrasted with the various philosophic practical sciences and Muslim legal sciences that share the same subject-matter.

In this attempt, the investigator is faced with the dilemma that, although ibn Khaldun shows intimate acquaintance with these philosophical and legal disciplines and with the writings of his predecessors on them, he does not present himself in his major work either as a philosopher or as a writer on legal matters, does not choose to continue either the Greek and Muslim tradition of political philosophy or any of the traditional Muslim legal sciences, and does not make a direct or thematic contribution in the form of a treatise on any of these disciplines. He considers his main contribution to be an almost wholly new science based on natural philosophy yet advancing beyond traditional natural philosophy by using certain conclusions of natural science to construct a complete science of culture.

The investigation of culture inevitably led ibn Khaldun to the investigation of the phenomenon of government, which is both a constituent part and the "form" (surah), i.e. the organizing principle, of culture. The third section of Book One of the "History" is devoted to this subject, and its title indicates the various problems which it investigates, "On States, Kingship, the Caliphate, and Sovereign Ranks, and the States Occurring in These - Containing Fundamental (Propositions) and Supplementary (Inquiries)."¹ Since government is the form of culture as a whole, we also find extensive discussions of this subject in all the other sections of Book One, including the section on the sciences. This treatment of political matters is not, however, an independent discussion and is not based on premises of its own but forms an integral part of the science of culture.

Ibn Khaldun himself distinguishes his new science, and his investigation of political matters within the scope of this science, from the traditional political science or political philosophy of his Greek and Muslim predecessors and also from the Muslim legal sciences. After recapitulating the substance of his own investigation of politics, an attempt will be made in this chapter to understand how he characterizes his new endeavour and justifies his departure from the well-established philosophical and legal traditions. We shall find that what appears at first to be an effort simply to distinguish between the science of culture and political philosophy and the legal sciences, progressively takes the form of a critique of, first, certain propositions, and, secondly, of the entire subject-matter of political philosophy and of dialectical theology though the critique of the latter discipline is less pronounced and more implicit.

In this connection, ibn Khaldun raises a number of problems crucial for understanding the character of both his own sciences of culture and of the

entire history of Muslim political philosophy and dialectical theology. In attempting to explore some of these problems, we have restricted ourselves to the issues that are indispensable for a fuller understanding of ibn Khaldun's position and have presented them in a perspective that seems to us to serve this purpose best. In characterizing the political thought of his predecessors, ibn Khaldun does not pretend to be an impartial historian, he assumes the role of a severe critic. The criticism is not based on blind faith or love for contention, but on certain theoretical and practical considerations.

B

In the section devoted to political authority and institutions,² ibn Khaldun remains loyal to the specific character of his new science. He begins with, and thereafter repeatedly recalls, the premises he had posited for the science of culture as a whole.³ The dominant theme of his discussion of political life is the explanation of the natural causes, powers, properties, stages, and accidents inherent in the properties of the human soul, and how they lead off necessity to the formation of political life and subject it to certain natural and necessary laws of human association.⁴

Like culture as a whole, political life is considered by ibn Khaldun to be a generated natural being. The methods he follows in determining its characteristics are, therefore, adopted from natural science in general, and from biology in particular.⁵ Genetically, he follows the development of political life through its various stages: how it is generated, grows, reaches its maturity, sickens, and dies. In biology, the efficient cause of this movement is taken to be the soul and its temper (mizaj). In culture, ibn Khaldun considers the efficient cause of the movement to be a specific property of the human soul, i.e. social solidarity ('asabiyyag) which is a combination of the natural feeling for one's relatives and friends, and of the need for defence and survival. It cements a group together, dictates the need for a ruler, leads to conflicts with other groups and generates the power of conquest leading to victory over others, its initial power determines the extent of this conquest, and the fulfilment of appetites and desires, finally, weakens it and leads to the disintegration of political power.⁶

This genetic method is supplemented by the analytical method through which ibn Khaldun distinguishes and compares the various forms of political power, and the institutional arrangement within each form. Apart from the purely natural regime in which a tyrant or small bands or groups give free rein to their appetites, there are two major types of regimes: (a) rational regimes in which the appetites are ordered by the agency of human reason for the sake of a more peaceful and permanent enjoyment of worldly things, and (b) regimes of divine Law in which prophet-legislators, through the power of their souls to communicate with the "unseen" (explained in the sixth premise), posit laws which order the affairs of men and the enjoyment of both worldly things and things of the soul useful for man's welfare in the world to come. This inquiry is supplemented with a description of the various institutional arrangements and offices in both types.⁷

Throughout this discussion, ibn Khaldun insists that his treatment of political life is not to be confused with the treatment of political life in the

Islamic legal sciences which aim at determining the legal prescriptions to be followed by adherents to the Islamic Law, with the sayings of popular wisdom which do not explain the nature of political life, or with political science or political philosophy which aims primarily at determining how man ought to conduct himself to achieve happiness and perfection.

In summarizing the Third Book of the Laws, al-Farabi informs us that Plato explained that all the *nomoi* are subject to generation and corruption and regeneration, and that he explained the growth of cities, the development of the arts, and the origins and development of governments.⁸ In this context, al-Farabi employs the two central terms which have come to be associated with ibn Khaldun's new science, i.e. 'umran and 'asabiyyah.⁹ Since al-Farabi indicates that generation and corruption are inherent in all the *nomoi* and in all cities all the time (i.e. they occurred in the past, occur now, and will occur in the future), he is also alluding to the fact that Muslim governments and laws are equally subject to these natural laws.

The context within which this and similar discussions occur, however, indicates that, for the political philosophers, the explanation of the natural origins and the generation and corruption of regimes is not an independent inquiry but a subservient branch of the art of legislation and, ultimately, of political science; its aim is to provide the legislator with the necessary knowledge upon which to base his decisions in laying down such laws as are appropriate to the particular group for which he is legislating under particular circumstances.

In contrast, the immediate and apparent context within which ibn Khaldun's inquiry into political affairs is pursued is not the art of legislation or political science, but the science of culture which he develops as an independent science. His major contribution consists in pursuing this inquiry with relative freedom from the art of legislation and of political science or the art of determining how men ought live, and in elaborating all the natural properties and concomitants of political life necessitated by man's natural constitution. Furthermore, he is the only Muslim thinker who has shown, explicitly and in detail, that Muslim history and Muslim regimes are indeed subject to these natural laws of generation and corruption, and, therefore, has insisted that the proper understanding of Muslim history presupposes the natural understanding of the essential properties of man and human association in general.

C

In defending the legitimacy of his new inquiry into political matters, ibn Khaldun does not attempt to present it as a new version of political philosophy or as a substitute for, but rather to explain the distinction between the new inquiry and the established practical philosophic sciences. This distinction is made on the ground of certain basic differences which ibn Khaldun invokes at appropriate places in the course of his inquiry. The examination of these differences will shed light on the fundamental character of both Muslim political philosophy and ibn Khaldun's new science of culture.

Immediately after formulating the basic principles of the new science,¹⁰ and asserting its relative independence and newness, ibn Khaldun sets out to

show that “it does not belong to the science of rhetoric, for the subject of rhetoric is convincing speeches, useful in attracting the multitude toward a certain opinion or turning them away from it.”¹¹ “Nor does it belong to the science of ‘political government’ (siyasat al-madaniyyah), for political government is the administration of the household or the city as is obligatory (bima yajib) according the requirements of ethics and wisdom so that the multitude be made to follow a course leading to the protection and preservation of the (human) species. Thus, its subject differs from the subject of these two arts which are perhaps similar to it.”¹²

Only after having stated this difference does ibn Khaldun proceed to suggest that the new science “is, as it were, newly discovered.” This suggestion is offered reluctantly on the ground that he could not find it in the works of the Greek wise men available to him, a fact which seemed to him to be in need of some explanation, “The Wise men perhaps were concerned in this with the fruits (of the sciences), and the fruit of this (science) is, as you saw, in (the correction of historical) reports only. Even though its problems in themselves and in their proper spheres are noble, its fruit is the rectification of (historical) reports which are weak (or not significant: da‘if). That is why they deserted it.”¹³

Ibn Khaldun’s claim for the relative independence and newness of his science seems thus to be intimately related to his success in distinguishing it, and setting it apart, from rhetoric and political science, or to his success in showing that it does not belong to either of them. This he does through delimiting the subject-matter of these two disciplines by emphasizing their ends or results or “fruits,” i.e. imparting certain opinions to the multitude and governing it according to the requirement of ethics and wisdom. The direct fruit of the science of culture, in contrast, is not convincing the multitude or making it follow an ethical or wise course or way of life (which in turn requires the knowledge of what the ethical virtues are, the practical wisdom of the legislator and the ruler, and the ability to convince the multitude), but simply the understanding of the nature and properties of man and human association or culture, an understanding which is pursued with the specific aim in rectifying historical reports.

The science of culture is not an art concerned with how man ought to live, how society is to be rightly governed, or how the multitude is to be convinced, but a scientific inquiry into how man actually lived in the past, and the natural causes determining the modes of human association and necessitating the activities and ways of life pursued in the diverse human societies about which we possess historical reports, in order to be able correctly to judge the soundness or falsity of these reports.

This leads ibn Khaldun to a second distinction between the science of culture and political science with respect to the inherent character of their subject-matters and, consequently, to their conclusions. It was shown that the premises of the science of culture are drawn exclusively from the conclusions demonstrated in the natural sciences. Subsequently, ibn Khaldun claims the same natural and necessary character for the entire subject and for the conclusions of this science. In contrast, political science, having as its objective the right conduct of government according to the

requirement of ethics and wisdom, does not restrict itself to these natural and necessary premises, but is concerned further with what is ethically or philosophically good for human society, and seeks to convince the multitude of the necessity or obligation of accepting it.

Ibn Khaldun insists that such matters cannot claim the natural and necessary character of the subject-matter of the science of culture. Because political science is concerned primarily with how man ought to live and how human society ought to be governed, it upholds principles which are not, strictly speaking, natural or necessary (i.e. grounded in the science of Plato's and al-Farabi's treatment of the laws, is subsidiary and accidental to their attachment to these other principles.

Ibn Khaldun does not then restrict himself to distinguishing between the new science and the traditional political science, to justifying the need for the new science of culture, and to showing that it has a relatively independent and legitimate subject-matter of its own; he makes, and repeats, certain observations about traditional political science which are not necessarily called for as far as his immediate task is concerned. At first sight, these observations seem to present traditional political science under unfavourable light, to suggest certain fundamental theoretical disagreements between ibn Khaldun and Muslim political philosophers, and to prove the superior character of the new science as compared to the traditional political science. Yet ibn Khaldun's own modest estimate of the "fruits" of the science of culture is a warning against accepting these conclusions at their face value. In order to explore his intention, we must first understand the issues involved.

The central issue which ibn Khaldun repeatedly invokes in this connection is the proof of the "necessity" of prophecy, and of the Prophetic religious Law, adduced by Muslim political philosophers. Upon the first reference to this issue, ibn Khaldun cites what is mentioned by wise men in their proof of the necessity of prophecies, what is mentioned in the fundamentals of jurisprudence (Usul al-Fiqh) in proving the necessity of languages, and what the jurists (fuqaha) mention "in the justification of legal prescriptions through their purposes."¹⁴

In all of these disciplines, the jurists attempt to present a natural proof for the necessity of a legal or conventional prescription, and they seem to argue as follows: men must co-operate in society, therefore, they necessarily need a ruler who must be a prophet, men by nature need to express their intentions, therefore, they necessarily need the easier method of doing this, which must be a language, must preserve their species and their social life uncorrupted, therefore, they must abstain from adultery, murder and injustice. The necessity of prophecy thus appears to be based on the same kind of argument and, consequently, to have the same status, as the necessity of language, and of the injunctions against adultery, murder, and injustice.

Now, all these have some basis in nature. But they cannot be traced directly or exclusively to nature, and they are not produced by nature in a necessary manner. They are, rather, the product of human convention and law, or of a divine Law. That they are not strictly speaking, natural or

necessary, becomes evident when we consider the diversity of languages and differences and conflicts among the various legal arrangements (including those claiming divine origin) in different communities. The mistake of these jurists consists in beginning with the nature of man and society, showing the need for some such conventions and laws, and concluding that this is sufficient proof or the exclusively natural and necessary character of conventions and laws.

While the proof of the “necessity” of prophecy shares in this general mistaken way of argumentation, it is in a class by itself, and we need to follow ibn Khaldun’s regulation of it more closely. According to him, the philosophers begin with the demonstration of the necessity of a government and a ruler. This demonstration he accepts as valid and adopts as the first premise of his science. However, “The philosophers (Falasifah) make an addition to this demonstration when attempting to establish prophecy by rational argument, and that it is a natural property of the human being. Thus, they confirm this demonstration (i.e. the indispensability of the ruler) up to its conclusion and that humanity cannot escape being under restraining and reconciling rule (kukm wadi’).

Then they say, after that, ‘That rule comes to be by a (divine or religious) Law (Shar‘) imposed by God and introduced by one (member) of the human species distinguished from them (i.e. the rest) by the special (properties) of His guidance with which God entrusts him in order that submission to him and acceptance from him take place, so, that ruling among them be completed without disacknowledgement or (angry) reproach.’ This proposition by the philosophers (hukama’) is, as you see, not demonstrable, since existence and human life may become complete without that (Law and prophet) by (virtue of) what the ruler imposes by himself or by (virtue of) the (social) solidarity (‘asabiyyah) by which he is enabled to conquer them (i.e. his subjects) and make them follow his path.

Thus the People of the Book and the followers of the prophets are few compared to the Magians who have no (revealed) Book, for they (the latter) form the majority of the inhabitants of the world. Despite that, they possessed States and monuments in addition to (simply) having lived, and they still have these to this epoch in the intemperate regions of the north and the south, in contrast to human life in confusion and without a restraining and reconciling (ruler) at all, this is impossible. By this becomes plain to you their mistake concerning the obligatory (character) of prophecies, and that it (this obligation) is not rational; rather, it is apprehended by the Law, as is the doctrine of the ancestors of the community.”¹⁵

On the surface ibn Khaldun’s argument is extremely simple, if not naive. The supposed demonstration of the philosophers is based on the minor premise that every ruler must rule with a divine Law.¹⁶ This is evidently false, since a ruler can rule by virtue of royal authority alone, and even a simpleton knows that there have been innumerable rules without divine authority. This simple fact could not have escaped the notice of the philosophers on this level.

D

There are two possible philosophic approaches to the study of man and society: the first, which is characteristic of ibn Khaldun's science of culture, is through the natural sciences, the second, which is the characteristic approach of the Greek and Muslim political philosophers, is through a consideration of the end of man. Since the end of man, his perfection or happiness, pre-supposes the understanding of the place of man within the cosmos of which he is a part, this latter approach comes after metaphysics or divine science ('ilm ilahi) in the order of the investigation.¹⁷ The first approach is based exclusively on natural science and does not admit any premises that cannot be demonstrated therein. It can, therefore, be properly called a "natural" science of politics. The second approach is based on metaphysics or the science of divine things and can, therefore, be called meta-natural or "divine" politics.¹⁸

The comprehensive works of ibn Sina, which ibn Khaldun specifically has in mind in discussing the issue, present us with two features significant for understanding ibn Khaldun's exposition.

(1) They all include two discussions of political matters, the first coming at the end of the natural sciences (in the sections corresponding to Aristotle's *De Anima*), and the other at the end of the divine science.¹⁹ Ibn Sina's works thus point to the fact that both "natural" and "divine" political sciences owe their origin to the philosophers. Yet in studying ibn Sina's "natural" version of political science, we come to realize the significant difference between him and ibn Khaldun: ibn Sina restricts himself here to the natural foundations of man's political life and does not proceed to develop a full-fledged science of society or politics on that foundation alone. He seems thus to suggest that these natural foundations are not sufficient for understanding the full scope of man's political life and cannot offer the proper directives concerning how he is to conduct himself as a political animal. Such an undertaking will have to wait until after the completion of divine science, or, as ibn Khaldun explains, it needs "additional" arguments which cannot be presented prior to the investigation of the world and of the place of man within it.

(2) Further, in his "Parts of Rational Sciences," ibn Sina specifies that the aim of the practical part of philosophy or wisdom is not the attainment of certainty about existents, but "perhaps" of opinions and not opinions simply but opinions for the sake of realizing the good.²⁰ In addition, that part of political philosophy which deals with political government studies all classes of governments, good and bad, those based on kingship as well as those based on prophecy and divine Laws.²¹ Although political philosophy may favour the political government based on prophecy, it transcends any particular class of political arrangements. These issues, however, are not raised in the exposition of the "divine" version of political philosophy in his comprehensive philosophic works, instead, he purports here to offer not a discussion of the total subject of political philosophy or the various classes of opinions and action in all political regimes, but what appears to be rational justification, or the "obligatory" character, of a specific class of political regimes, i.e. that which is originated by a prophet-legislator.

The final four chapters of the *Shifa'*, for instance, indicate that ibn Sina would treat the proof of prophecy, and the prophet's call to God and the return to Him, prayers and their utility in this world and the next, the foundation of the city and the household, and legal prescriptions relating to them (discussed within the framework of prophetic legislation) and successors to the Prophet (Caliphate and Imamate) and other matters relating to governments and ethics.²² The whole discussion is, thus, centred on prophecy and pre-supposes its "obligatory" character.

Ibn Khaldun's first and foremost observation on the total scope of the subject-matter of "divine" political science is that it is not natural (*tabi'i*) or necessary (*daruri*), by which he means the same thing and it is fundamentally this: Considering the natural constitution of man as a political animal, we do not find the revelation, divine governments, and the concern with resurrection and reward and punishment, to be necessary conditions of his survival, for the formation of society, and for the continued existence of both. Religion does not belong to those requirements that form the indispensable minimum for the existence and preservation of society, it is not the sufficient condition, nor even one of the sufficient conditions, required for social life in order that may exist and continue.

Man's natural constitution and the character of society do not make it absolutely mandatory upon man to be a member of a religious community and to obey the prescriptions of a divine Law.²³ Given human nature, prophecy and revelation are possible phenomena. Supposing that a prophet does come and that he possesses, in addition, the ability to rule, to command obedience, and to legislate, there will come to exist a divine Law. And given certain climatic and other conditions, his Law must include certain opinions, such as that prophecy is necessary. These opinions are legally "obligatory" or binding upon the followers of that Law; the source of this obligation is not human nature and the nature of society, or unaided human reason, but a specific divine revelation and a specific divine Law.

Thus, what induces ibn Khaldun to reject the natural and necessary character of religion and divine Laws, and, consequently, of the whole subject-matter of "divine" political science, is not merely that divine government, like man-made language and injunctions against adultery, murder and injustice, is conventional or legal in character.²⁴ For, despite their conventional character, it could be shown that, unlike divine government, all the rest are necessary conditions for the existence and preservation of any society,²⁵ and that the authority of unaided human reason is sufficient to prove that. (Ibn Khaldun says, for instance, that the authority of human reason is "sufficient" for "forbidding injustice."²⁶) Divine government is not only legal convention, it does not even belong to those legal conventional arrangements that form the indispensable minimum required for the existence and preservation of society and which can be said, therefore, to be natural and necessary convention.

Ibn Khaldun's second major observation is that the premises and, consequently, the conclusions of "divine" political science are not rationally demonstrable (*burhani*), i.e., unaided human reason cannot achieve certainty concerning such subjects as the obligatory character of divine revelation and

the divine Law, the necessity of believing in the opinions about God, resurrection, and reward and punishment, or the necessity of performing the actions prescribed in a divine law, such as worship. The authority for the obligatory character of these opinions and actions is the divine law itself. Divine Laws, however, command and do not demonstrate (at least not rationally) the necessity of holding the opinions and of performing the actions commanded.

So far as human reason is concerned, these commands remain undemonstrated, i.e. they continue to hold the status of belief or opinions. Whether these opinions are true or false, generally accepted or not, practically good and useful or bad and harmful, or whether they are preferable or objectionable, is not here the issue; rather, it is the obligation (set up by those who pretend to have shown that these opinions are rationally obligatory) does not impose itself on human reason. The only obligation that seems to be convincing is the legal obligation set up by divine Laws. Unlike demonstrated conclusions, undemonstrated opinions do not by themselves compel the assent of human reason; in order to be accepted, they need an additional force, which in this case is provided in divine Laws.

We are not in a better position to understand the reason why ibn Khaldun distinguishes at the outset between his new science of culture, on the one hand, and the practical philosophic sciences, the legal sciences and popular wisdom, on the other, and why, in discussing the six premises of the new science, he distinguishes between what can be demonstrated and what cannot be demonstrated within the sciences of nature. Only in the science of nature are we able to arrive at demonstrated conclusions about what is natural and necessary for man and society. The conclusions of all these other sciences are undemonstrated opinions.

This is also the case with the conclusions of the divine science or the science of divine beings. The fact that “divine” political science is based on premises derived from divine science deprives all of its conclusions of their demonstrable character. This is also the reason why ibn Khaldun mentions rhetoric as the first of the practical philosophic sciences. Since the practical sciences deal with opinions, and opinions do not compel assent immediately, an art is needed which is capable of convincing men to accept certain opinions and to reject others. This is precisely the function of rhetoric. In the practical sciences, the philosophers do not follow the method of demonstration; they are not, strictly speaking, philosophers but rhetoricians.²⁷

E

Ibn Khaldun’s critique of “divine political science presents a curious paradox: it defends religion against the mistakes of theologians and it defends philosophy against the mistakes of philosophers. His defence of religion consists in establishing revelation and divine Laws as the exclusive source for beliefs in the substance of the doctrines relative to prophecy and divine government, yet he objects to every kind of theology or the effort to prove these doctrines rationally. His defence of philosophy consists in the bold assertion that, in as far as reason is concerned, the political doctrines

purporting to support religion cannot claim a status higher than that of undemonstrated opinions, and he exposes the philosophers who claimed that they were presenting properly a philosophical support or defence of religious doctrines, or had succeeded in turning philosophy into a rational theology. From this it appears that ibn Khaldun's critique is not directed against philosophy, but against theology, not against philosophers as philosophers, but against philosophers in their role as theologians, dialecticians, and rhetoricians.

This critique is based on the distinction between religion or, more specifically, religious beliefs and practices based on a particular revelation and divine Law, and philosophy or, more specifically, the body of scientifically demonstrated conclusions based on rational inquiry. It is characteristic of ibn Khaldun that he upholds the legitimacy of both religious knowledge and scientific philosophic knowledge in their proper spheres, and contests the theoretical legitimacy of all disciplines that occupy an ambivalent position between the two and profess to demonstrate their agreement. Such disciplines, which according to him belong to sophistry and rhetoric rather than either to religion or scientific philosophy, are primarily the dialectical theology of the Mutakallimun and the political theology of the philosophers.

Religiously, ibn Khaldun identifies himself with the early Muslims or the pious ancestors who rejected all attempts at rational justification of religious beliefs and practices as unnecessary, if not dangerous, "innovations." But since these pious ancestors were innocent of the philosophic sciences, they could not be considered his true precursors. Philosophically, he supports his position, not only on the basis of the requirements of scientific demonstration, but by invoking the authority of the philosophers who followed the method of verification (*muhaqqiqun*). He thus shows a predilection for pure religion and pure philosophy over against any kind of theology which is necessarily a confused mixture.

It is noteworthy that in the crucial passage where ibn Khaldun criticizes the divine science and the political theology of the philosophers, he mentions al-Farabi and ibn Sina but not ibn Rushd.²⁸ Of Muslim philosophers, it was precisely ibn Rushd who (like ibn Khaldun) was a recognized religious judge (*qadi*) and a philosopher who criticized al-Farabi and ibn Sina for imitating the dialectical theologians, and who wrote the most celebrated treatise on religion and philosophy the main theme of which is the defence of the legitimacy of religion and philosophy in their proper spheres, and which is a devastating attack upon the combination of religion and philosophy in the form of theology.²⁹

It is not possible here to enter into the historical and doctrinal developments that led to ibn Rushd's new attitude towards theology. For our immediate purpose we need only note that in this decisive respect ibn Khaldun is following in the footsteps of one of the most illustrious Muslim predecessors. Therefore, his position could not be construed to be anti-philosophic or based on any lack of understanding of the intentions of al-Farabi and ibn Sina. To understand his specific reasons for criticizing them,

we must now analyze his treatment of Muslim dialectical theology (Kalam), and of the divine science and political theology of the “philosophers.”

“Dialectical theology,” says ibn Khaldun, “involves arguing for the beliefs of faith with rational proofs, and answering the innovators who deviate in (their) beliefs from the ways of the ancestors and the followers of orthodoxy.”³⁰ The beliefs of faith consist of such things as the attributes of God, the truth of revelation and prophecy, the angels, the spirits, the jinn, resurrection, paradise, hell, etc. Unlike things that have rationally ascertainable natural causes, these are ambiguous matters, the reality of which reason cannot ascertain. Therefore, it must be left to the divinely-ordained legislator (the Prophet) to determine them and teach them. The general run of believers, like the deaf and the blind, must accept the authority of their fathers and teachers, and since they cannot establish the truth of these matters, they must follow the general accepted opinions about them, based on the command of their prophet-legislator.³¹

More important, however, is the fact that these beliefs are not theoretical assertions but part of a way of life within a system of divine government intended for the happiness of the believer. Their purpose is not mere knowledge or belief or assent or faith. Perfection, according to the legislator, consists of “perfect faith” or the habit firmly rooted through practical repetitive action (worship, obedience, and the submissiveness), until believers possess the established attribute moulding their souls. Beliefs are not primarily intended to be known, but to “be possessed,” their purpose is not knowledge, but practical utility, their end is not theoretical perfection, but the happiness promised by the legislator.³²

The proper function of dialectical theology is to defend beliefs with rational arguments, but since this is not necessary for faith, it is only useful when these beliefs are endangered by innovators. At that time, dialectical theology had a useful function to perform. Once innovators are suppressed (rational argument being one of the tools used in this fight),³³ dialectical theology has no further reason to exist; indeed, it can be harmful, since it gives the impression that rational arguments are somehow necessary for accepting beliefs. This is false both because (except in the case of rational attacks upon them) beliefs do not need rational support and because that rational support offered by dialectical theology is only dialectical, sophisticated, or rhetorical (i.e. based on common opinions), it has no scientific value.³⁴

While discussing the emergency of dangerous innovations, ibn Khaldun notices a certain identity of origin and a certain parallelism between the opinions of the innovators (the Mu‘tazilites and the Shi‘ites) and the writings and opinions of the philosophers “which are in general at variance with the beliefs of the divine Law.”³⁵ He indicates that innovators in Islam studied the works of the philosophers. But it seems also that the philosophers in turn took notice (e.g. in their rational proof of the obligation of having successors or Caliphs to the Prophet)³⁶ of the opinions of the innovators or of the Mu‘tazilite and Shi‘ite theologians, and presented identical or similar opinions, or that philosophers presented themselves to the Muslim community in the guise of Muslim theologians purporting to

give a rational support for certain Muslim beliefs and more specifically of those beliefs, held by the heterodox minorities, which were closer to their own views.

Be this as it may, ibn Khaldun was also aware of the radical difference between the content and the ultimate intentions of the views of the philosophers and those of theologians of all shades. That is why he devotes special chapters to the exposition of divine science and of the philosophy centred on this divine science.

In contra-distinction to all dialectical theologians, philosophers suppose that “all” existence can be apprehended by “mental contemplation and rational syllogisms.”³⁷ It thus appears that they include all “spiritual” being in their contemplation; hence, they purport to give (in divine science) a rational, syllogistic knowledge of God, the soul, resurrection, etc., or of the religious beliefs revealed and commanded by the prophet-legislators. Unlike dialectical theologians, however, philosophers do not begin with religious beliefs revealed and commanded by the prophet-legislators. Unlike dialectical theologians, however, philosophers do not begin with religious beliefs as revealed by the prophets and attempt to elucidate them or support them rationally; their position is that reason can know these matters independently of revelation. Being philosophers, they also believe that the rational syllogistic knowledge of these matters is superior to divine revelation and, therefore, must be made the final judge of the correctness of revelation, or that “the rectification of the beliefs of faith is through contemplation, not through tradition (hearing: sam‘), for they (i.e., the beliefs) belong to the apprehensions of the intellect.”³⁸

But philosophy does not content itself with presenting theoretical knowledge as a superior alternative to the religious belief; philosophy is also a way of life, and the philosophers contend that true happiness consists of complete theoretical knowledge, or “the apprehension of all existents...through this contemplation and those demonstrations,” together with the improvement of the soul and the acquisition of the virtues (all of which can be known and established by the sole agency of reason. In contrast to the religious way of life and the happiness of the philosopher “is possible for the human being even if no divine Law comes down.” For the lovers of wisdom, the blessed life means theoretical knowledge and living according to the dictates of reason, and eternal suffering means ignorance.³⁹

In presenting the content of their theoretical knowledge and of their way of life, however, philosophers have committed grave errors, not only from the more apparent standpoint of religion, but also from the standpoint of philosophy itself. Philosophy says that scientific knowledge has to conform to certain conditions and that scientific demonstration is possibly only within the limited range of what can be humanly experienced and known. Yet philosophers in general, and al-Farabi and ibn Sina in particular, seem to speak about all sorts of “spiritual” matters: the One, the source of all beings, the emanation of beings, the states of the soul after departing from the body, its return to the source joining the active intellect, and resurrection.

Further, they present these matters in a manner suggesting that they are the philosophical parallels to, or the true meaning of, religious beliefs and even “that the joy resulting from this apprehension is identical with the happiness promised (by the prophet-legislator).”⁴⁰ Yet their great master, Plato, had said, “As to divine (things), no certainty can be realized concerning them; rather, they are spoken of in accordance with what is most fitting and proper” - he means “opinion.”⁴¹

Since Plato was indeed the great master of al-Farabi and ibn Sina in their exposition of divine matters, and the *Timaeus*⁴² and the *Laws* were their models, we are faced again with question why the philosophers, including Plato, should find it necessary or useful to speak profusely concerning matters of which one cannot achieve certainty; why, having done this, al-Farabi and ibn Sina did not indicate clearly that they were only giving the most fitting and proper “opinions” about these matters, and why, finally, they gave the impression that these opinions were the equivalents or the fitting interpretations of religious beliefs - in short, why they presented fitting opinions in the guise of demonstrated conclusions on religious beliefs. The exploration of this theme is an indispensable pre-requisite for a sound understanding of Muslim political philosophy. For the present, we shall restrict ourselves to the following observations with the intention of clarifying ibn Khaldun’s position.

In this section on “divine science” (‘ilm ilhai) in the “Enumeration of the Sciences,” al-Farabi divides this science into three parts: the first two examine existents as existents and the principles of the demonstrations of particular theoretical sciences (logic, natural science and mathematics), respectively. The third part examines incorporeal existents, their number, order, and progression to the most perfect One, explains the attributes of this last and perfect incorporeal existent, explains “that this which has these attributes is the one which must be believed to be God,” makes known the descending order of existents beginning with Him, explains that the order of the existents involves no injustice or irregularity, and finally “sets out to refute corrupt opinions” about God.⁴³

The relation between political science, treated by him in the following chapter and the last function of divine science is not immediately clear, although the inclusion of dialectical theology (*Kalam*) as part of political science leaves no doubt as to the political importance of the opinions of the citizens concerning incorporeal existents. In his strictly political writings, on the other hand, he does set up a detailed theology for the inhabitants of the city.⁴⁴ But there he does not speak about the relation between this theology and the examinations conducted in divine science. We conclude that al-Farabi leaves the problem of the relation between divine science and political theory set up for the inhabitants of the city ambiguous, at least in his more public writings.

At first sight, ibn Sina appears to have followed a different course. In all of his works that deal with the whole subject-matter of philosophy, he presents the conclusions arrived at in divine sciences as making “obligatory” the existence of the prophets, the legislation of divine Laws, and even the contents of the beliefs and practices legislated in these Laws.⁴⁵

It is true, as ibn Khaldun observes, that ibn Sina begins his second version of political science with a recapitulation of the conclusions arrived at in the first (natural) version of political science and seems to be building the “obligatory” character of prophecy and divine Laws upon that natural basis; but ibn Khaldun correctly notes that the “proof” of the obligatory character of prophecy and divine Laws is not based on the nature of man as explained in *De Anima*, but on the additional examinations conducted thereafter in divine science.

Ibn Sina’s presentation of his political theology is indeed based on rational considerations, but not on the rational consideration of the nature of man as in *De Anima*; rather, it is based on the attributes of “the First Cause and the angels.” Being what divine science has presented the First Cause and the angels to be, it is obligatory that they should send prophets and divine Laws.⁴⁶ Since divine science is a rational science, the obligation set up here seems to be rational, not legal; God and the angels are not bound by Laws but by their very nature. Thus, ibn Khaldun is again justified in interpreting this rational obligation to mean natural necessity, and in wondering why God and the angels do not uniformly act in accordance with what is purported to be their very nature, why they have not fulfilled their obligation to the overwhelming majority of mankind and why only on rare occasions have there been prophets and divine Laws.

Ibn Sina seems indeed to argue in the context that the realization of prophecy is necessary as a preparation for the existence of the “good order” or of man’s possible perfection, a perfection which he assumes to have become evident as the proper end of man in divine science, but this raises the further question whether prophecy and divine Laws, as they are known to exist, are preparations for this type of perfection. We are, thus, forced to note that despite the apparent clarity of his presentation of the relation between his divine science and his political theology, ibn Sina leaves many questions unanswered, or that his presentation is as ambiguous as that of al-Farabi. There is, thus, ample justification for ibn Khaldun’s criticism. Following Plato, he explains that these ambiguities follow from the fact that in divine science itself the philosophers have not attained, or at least have not presented, certain knowledge, but only fair and fitting opinions. Therefore, their political theology has the same character.

Ibn Khaldun raises this issue in the most acute and critical fashion, he reveals that the philosophers, in presenting fair opinions and undemonstrated conclusions concerning the way to theoretical perfection and happiness, could only defend them by means of dialectical and rhetorical arguments, and, dialectical theologians, they do in fact assume the same role as the dialectical theologians when presenting and defending these opinions. In taking his bearings on these matters, ibn Khaldun distinguishes between philosophy properly so-called, i.e. the philosophic sciences which do in fact pursue the method of demonstration and about the conclusions of which, when properly arrived at, there can be no doubt, and philosophic theology (the greater portion of divine science) and political theology (or “divine” political science) which are in fact the philosophic versions of

dialectical theology (Kalam). He accepts the former (i.e. logic, natural science, mathematics), while rejecting the latter.⁴⁷

Ibn Khaldun's theoretical reason for this rejection is justified but cannot be considered sufficient. For granting that ultimately the theology and divine political science of the philosophers are in fact likely images and opinions presented in the guise of rational beliefs, it remains to be shown that these images and opinions are not only contrary but in fact inferior to the religious beliefs of the community in which they were being propagated. From the standpoint of demonstrative science, religious beliefs and philosophic or rational opinions enjoy the same status - they are all opinions. The quotation from Plato, however, indicates that opinions are not all alike: they can be distinguished as being more or less fitting or proper. The philosophers hold, in effect, that their rational opinions are more fitting or proper than religious beliefs and that their way of life, their virtues, and their happiness are more truly such than the way of life, the virtues and the happiness, pursued on the basis of divine Laws. Ibn Khaldun is silent on this subject; he does not attempt a direct refutation of this contention.

Instead, he explains that the philosophic way of life contradicts the religious way of life which is based on faith and obedience to the commands of a prophet-legislator, that the content of the happiness pursued by the philosopher, and that the attempt to equate or harmonize the two is an impossible task and one which is fraught with danger for the religious community - it breaks the protective wall around it, leads to doubts and scepticism about the beliefs of faith, and turns the faithful away from the tasks appointed for them by their prophet-legislator.

The philosophers were not justified in preaching their opinions to the Islamic community. Whatever their intention about reforming the beliefs of the Islamic community might have been, they had only sown confusion in the minds of the faithful, and led to the emergence of mistaken notions about the distinct purposes of religion and of philosophy. Their own way of life and their own happiness are of no concern to the religious community, and since they assert they can pursue this way of life and attain happiness regardless of the existence of divine Laws and of a religious community, they had no compelling reason to sow the seeds of confusion and dissension within the religious community and endanger its peace.

Political life, as practiced in all human communities, has to take into account the nature of all men, and should be directed to the common good of the multitude. This requires a ruler and a law based on the rational understanding of their common needs and interests in this world, or a divine Law based on their common good in this world and the next. But in every case, it is mandatory that the ruler and the law should set up opinions and actions in the forms of commands to be obeyed without qualification. The philosophic life, however, transcends all established laws. The real "meaning" of political science, "according to the wise men" themselves, is to lead a way of life in which "they dispense with rulers altogether," their "virtuous city" is not an association of men subject to commands serving their common interest, and they talk about it as a supposed or hypothetical city whose realization is highly improbable.⁴⁸

The philosophic life is then radically different from the ordinary political life of the citizens. It requires rare natures and rarely accomplished arts. The philosopher is essentially a solitary being, and the best he can hope for are few kindred spirits within a vast majority of men leading different ways of life and pursuing different ends. Since he needs to live in a political community, ibn Khaldun offers him this opportunity, but within clearly defined limits: he is not to interfere in the political life of the community in his capacity as a philosopher, not to attempt to reform the opinions of this community, not to communicate his opinions or propagate his way of life among the multitude, and he is to relinquish his role as a theologian and as a divine politician. He should restrict himself publicly to practicing the demonstrative sciences (logic, natural science, mathematics) and the useful arts (e.g. medicine, music and jurisprudence). But, above all, he should, like ibn Khaldun, uphold in no uncertain terms the Law of his community and obey it. The philosopher must present himself to his community in the guise of an ordinary citizen.

F

For certain thinkers, polemic is a method of examination and investigation, a way of entering into a dialogue with their predecessors, and a means of uncovering what lies behind or beyond the garb with which their predecessors chose to clothe their thought or in the manner in which they expressed it. When, in addition, this polemic is presented to the reader to draw attention to the theoretical difficulties encountered by the author and his proposed direction for finding a solution, and to an audience which the author intends to convince to accept or reject certain opinions or a course of action, the polemic necessarily gains a formal complexity difficult to comprehend without a sustained attention to the diverse, and perhaps conflicting, purposes which is designed to serve. Ibn Khaldun's polemic against ibn Sina is an instructive example.

Muslim philosophers, dialectical theologians, and mystics, like the jurists, the pious leaders of the community, and the common run of Muslims seem to accept the superior character of the opinions and actions legislated by prophets in general and their own Prophet in particular. The unsophisticated Muslim believes in the opinions of the Prophet and performs the actions commanded by him because of his faith in their divine origin, his expectation of rewards, and his fear of punishment in the world to come, the pious leaders of the community defend and promote, by exhortation, example, and threat of punishment, communal obedience and devotion to the beliefs and the way of life of their community, the jurists formulate and elaborate the prescriptions of the Law of their community, the mystics devote themselves to practical exercises designed to facilitate the institution of the verities beyond the beliefs and legal prescriptions designed for the common run of Muslims, the dialectical theologians protect the beliefs and the ways of life of their community against rational doubts and attacks, and the philosophers attempt to present an additional rational ground for the coming of the prophet and the setting up of the opinions and actions he commands.

Ibn Khaldun, too, presents himself as the defender of Muslim beliefs and the Muslim way of life. But, instead of choosing to join the apparent consensus of all the parts of the community, or to re-establish such a consensus where it is lacking through harmonizing apparently conflicting views, he labours to make implicit conflicts explicit, to show that the apparent consensus conceals some fundamental differences, and to intensify these conflicts and differences by a show of vigorous partisanship. He is the partisan fighting for the simple, unsophisticated beliefs and the way of life of the common run of Muslims, and for the undiluted, unexplained, and unsupported faith, against the useless and dangerous efforts of mystics, dialectical theologians, and philosophers, to defend, explain and support Islam. What were the fruits of the victory, so intensely coveted by him?

On the scientific and theoretical plane his immediate aim is to disentangle the confusion between dialectical theology, mysticism and philosophy. This confusion or mixture (khalt), as we learn from his account, reigned in these disciplines in his time, and those primarily responsible for it were the “modern” school of dialectical theology and the later extreme rational mystics.⁴⁹ This objective is achieved through the reassertion of the legal character of dialectical theology and mysticism. Both must accept the beliefs and the way of life of the community and unquestionable basic axioms, they should make no pretension to extra-legal or properly rational knowledge of the nature of things: dialectical theology is to restrict itself to the defence of the beliefs and practices of the community when these are questions, and mystics should keep their supposedly intuitive achievements to themselves.

Since this confusion has been harmful to philosophy (it was in danger of losing its distinctive character and of becoming a tool of dialectical theology and mystical exercises), philosophers should contribute to it by presenting themselves to non-philosophers in the guise of dialectical theologians and mystics, as ibn Sina had done: philosophy is to exercise greater circumspection.

What induced the philosophers to present a rational support for prophecy and divine Laws was no doubt the realization that a community living in accordance with such Laws is superior to other communities - to communities without God or gods, without concern for the welfare of the soul, and without hope of a life to come. This has a demonstrative rational foundation (it is shown in the science of nature that the soul is higher than the body), and it is at the basis of ibn Khaldun’s division of regimes into “rational regimes” and “regimes of Law.”

But to say that the soul is higher than the body, that prophecy is possible, and that a regime without a divine Law, and to say that prophecy and prophetic Laws are obligatory, or that reason can prove or support the commands, the beliefs, and the virtues, set up by a legislator - these are two radically different things: the former set of propositions has solid support in the investigation of the nature of man and society, the latter has no such support.

A strictly natural, rational, and demonstrative approach to man and society is then faced with the dilemma that, while it can attain certainty

about the necessity of society, the need for a ruler, and the preservation of peace through a minimal practice of justice, it can attain no such certainty about morality, virtues, or rules of conduct. Morality and virtues of character are not, strictly speaking, natural or necessary; they have no natural basis, no ground in nature. There is not a single universally valid rule of conduct. Rational morality has no secure foundation or justification in nature, and rational moral laws are not essential to man's nature or to the nature of society.⁵⁰ There can, consequently, be no theoretical science of ethics or politics except in the extremely limited sense developed by ibn Khaldun in his science of culture.

But although not simply natural, rational, and universal, morality, virtues and general rules of conduct are not simply against nature. Society, to flourish and to be preserved, requires the common pursuit of practical ends, and these require in turn a morality and virtues readily accepted and commonly agreed upon by all, the majority or the better part of society. This is not the morality of the philosopher. The philosopher sees human perfection in theoretical knowledge. Theoretical activity has its own immediate reward. The rewards of the practice of moral virtues, in contrast, are neither evident nor immediate. They must be based on less evident rewards, such as glory or honour, or future rewards such as happiness promised to the just and the virtuous in the world to come.

The philosophic study of ethics and politics, if it is intended to go beyond the perfection and the happiness reserved for the philosopher and possible only through philosophic way of life or the life of theoretical activity, has to assume the character of a practical discipline and to have as its object the generally acceptable opinions about goodness and happiness, e.g. that moderation is good, that the pleasures of the soul are superior to the pleasures of the body, or that the future rewards of virtue are preferable to the immediate rewards of vice. The aim of such a practical philosophy, however, is not knowledge but action, i.e. the practical pursuit and realization of the good.

Yet philosophy, since it does not rule in cities, lacks the practical implementation of what it considers fair and fitting; therefore, the need for a ruler, a legislator, a law, and a tradition as instruments for the execution of moral duties and obligations. It is thus not philosophy, but the legislator, the legal prescriptions, and the embodiment of the law in the traditional way of life of the community that are the efficient cause which forces the citizens to lead a virtuous way of life. The law, and not practical philosophy or reason, is what redeems that lack of ground or necessity in nature: it supplies the justification, the obligation, and the authority that compel the citizens to hold fast to fair and fitting opinions entailing the renunciation of their natural and compelling desires which opinion alone is unable to achieve.

Divine Laws revealed to prophet-legislators have the additional force of being based on the belief in their divine origin, in the over-powering will of God, and in the certainty of the rewards and punishments in the world to come, they are thus the most efficient laws and offer the most compelling ground for accepting as valid what cannot be demonstrated by nature and reason.

The attempt to offer a natural and rational explanation of the beliefs embodied in these Laws, as practised by dialectical theology, mysticism, and philosophy, is unwise and dangerous. It may, in certain cases, strengthen the faith of the believers in the commands of a divine law, but it may also weaken that faith by bringing to light certain discrepancies between these commands and what is rationally most fitting and proper. Since, ultimately, there is no naturally or rationally demonstrative and compelling ground for these commands, the multitude will be made aware of this fact and this will lead to the loss of unquestioned faith in them and since the multitude are incapable of knowing or pursuing the human perfection attainable by theoretical activity, they will pursue sham and pseudo-scientific activities: the citizens will lose their civic or religious virtues without finding the happiness reserved for the true philosopher.

Ibn Khaldun's theoretical consideration of the nature of man and society thus results in a practical teaching aimed at the protection of the Muslim religious community and its divine Law against the confusion and disruption resulting from the vulgarization of philosophy. This practical teaching is founded on the consideration of the respective character of rational morality and the law, but in recommending it to the Muslims of his time, ibn Khaldun supports it by the more acceptable authority of the Prophet, the pious ancestors, and the consensus of the leaders of the community, i.e. he presents it as a legal injunction. Whatever the theoretical status of his critique of the social role of philosophy may be, his practical recommendation to the faithful must be obeyed because of its legal character.

Ibn Khaldun did not consider the critical issue for the Muslim community of his time to be the rational justification or support of its divine Law. Indeed, he thought that this issue was a luxury which his community could not afford because it was faced with problems that involved its very existence. Long periods of cultural decline and disintegration were threatening to dissolve the fabric of society. What the community and its leaders needed most was clarity concerning the elementary and natural foundations of human association or culture and the understanding of the natural and necessary conditions without which no society can exist at all. Muslims had for centuries lived as members of a religious community under the aegis of the divine Law until they came to forget other forms of social life and the fact that religion and the Law cannot continue to exist except when based on a solid foundation of social solidarity, royal authority, and other indispensable natural conditions.

The Prophet and the early Muslims were clearly aware of that and acted accordingly. But in ibn Khaldun's time, this was no more the case. Therefore, he set out to teach his compatriots and co-religionists the telling lessons of history, and his new science of culture and his investigation of the natural basis of political life within this science were intended to explain to his readers those elementary, indispensable natural conditions which Muslims and their rulers need to consider if they are to succeed in preserving their religious community and divine Law. They may not need philosophy to explain and support their religion and Law, but they are in

desperate need of it for understanding the natural foundation of their religion and Law, and this in turn is an indispensable condition for preserving their way of life.

18. In al-Farabi’s “Enumeration of the Sciences,” political science (which includes the art of jurisprudence and the art of dialectical theology) comes at the end immediately following divine science. Following the same scheme, all of ibn Sina’s comprehensive philosophical works relegate political science to the very end to be treated as an ancillary to divine science. This argument is based on the consideration that the subject of divine science includes the study of “spiritual” beings, and is, thus, in a position to correct the false opinions about them in the city, and that, for ibn Sina in particular, the “branches” (furu‘) of divine science are concerned with the study of revelation, miracles, resurrection, and reward and punishment; cf. al-Farabi, Ihsa’, pp. 99 - 101; ibn Sina, Aqşam al-‘Ulum al-‘Aqliyyah (The Parts of Rational Sciences) in Tis‘ Rasa’il, Cairo, Matba‘ah Hindiyyah, 1326/1908, pp. 112 - 16.

A political science concerned with the opinions and actions of a religious community must, therefore, follow the study of the principles of these opinions and actions in divine

science. Ibn Khaldun, who clearly saw the close relation between divine science and the “divine” version of political philosophy, adopts, as we shall indicate, an equally critical attitude towards both.

50. Since the attack of al-Ghazālī and ibn Rushd on ibn Sina, the latter’s star declined, especially in western Islam. To attack ibn Sina was fashionable, not only in theological, but in philosophical circles as well. The significance of ibn Khaldun’s attack, however, consists in uncovering those fundamental, bitter, and practically dangerous philosophical truths which philosophers before him, precisely because they identified themselves with the philosophers, could not utter.

Chapter 50: Arabic Literature, Poetic and Prose Forms

A. Poetry

Let us imagine an Arab Bedouin riding his camel on frequent long journeys across lonely deserts. While the rhythmic beating of the padded hoofs on soft sand breaks the stillness of the air, the rider is sunk deep in recollections of his own past. As he feels excited to share his mood with his “two companions and fellow-travellers,” there is nothing more natural than that he should start chanting in unison with the movement which has the sole possession of his entire perception. This unsophisticated outpouring of one’s heart in response to an occasional urge took the form of *rajaz* - the simple iambic alternation of *harakah* (moved or vocalized) and *sukun* (quiescent consonant) corresponding to the alternation in the lifting and lowering of the camel’s feet. (Cf. the *khbab* in which the pattern of alternation corresponds to the pace of the horse.)

The observation of the effects of the “song” induced a deliberate practice to beguile the man and quicken the animal. As the practice grew and attracted talent, formalities accumulated by common taste and general acceptance, giving rise to the art of poetry. The art was not slow to create for itself forms much more varied and complex than the original *rajaz*. About the middle of the second/eighth century when al-Khalil scrutinized the structure of Arabic poetry according to the quantitative measure suggested to him by the different tones on the rebound of the smith’s hammer (just akin to the camel’s tread) he admirably reduced it to a system of prosody consisting of 16 material forms.

Some foreign influence is not precluded from the development of some of these standard Arabic forms, all of which, of course, did not, and could not, have an equal measure of antiquity or popularity. What is remarkable is that this system of prosody sufficed to serve as the hard core of future indigenous development as well as assimilation of foreign models up to the present day.

By the quarter of the fifth century A.D. when we get our first yet full acquaintance with Arabic poetry, myriads of tribes hailing from different quarters of the country had commingled sufficiently at commercial coliterary fairs, e.g. that of ‘Ukaz, religious such as at Mecca, and cultural as that at Hirah, to evolve a common language and widely appreciated norms and forms of artistic composition, though, naturally enough, they exhibited peculiarities of usage of speech. This common literary medium which developed out of the North Arabic, coinciding with the steady decline of the economic, political and cultural influence of the South, was leavened mainly in Hirah with the accompaniments of material and religious civilization as augmented with currents - Judaic, Christian, and Graeco-Roman - from the opposite end of the Northern Desert.

Generally speaking, it was precise to finesse so far as Bedouin life and environment were concerned, but lacked the facility for conveying abstract ideas and general concepts. However, it possessed, by the very nature of its being a compromise between various dialects, an immense wealth of synonyms together with ample resources of rhyme and assonance inherent in its schematic morphology. Thus *saj’* (rhyme) came to be the first and

natural form of artistic composition prompted by the instinct for symmetry and balance in the structure of short, compact sentences especially designed for intonation and oral transmission without being committed to writing.

The saj' existed before metre; the evolution of metrical forms only pushed it to the end of a verse under the name of qafiyah. It is sometimes overlooked that the qafiyah constituted an essential element - and not an additional, far less artificial, embellishment in the structure of Arabic poetry. In other words, verse without qafiyah has been unknown in Arabic during its infancy as much as in its youth and old age. As we shall see later, so long as there was healthy development, any tendency on the part of the qafiyah to rigidity and monotony was checked in due time by adequate adaptation to the requirements of the theme (vide the evolution of muzdawij and musammāt).

In the period of decadence it was not sheer conservatism but a deep realization of its essential worth, which caused artificiality to be preferred to freedom. The positive function of the qafiyah in laying down rails, so to say, for the movement of thought, is demonstrated by the spontaneous rush of the imagination of the audience to the end - almost the entire later half - of a line ahead of actual recitation by the poet.¹ Such a thrilling experience of effective communion between the poet and his audience is in no way rare wherever Arabic poetry (or Persian or Urdu poetry for that matter) is recited even today. This is quite apart from the practical utility of the qafiyah in helping memorization as alluded to before.

In the sociological fabric of the pre-Islamic time the poet occupied a very high and influential position. The popular mind was impressed so deeply with the efficacy of his art that it believed him to be in communion with some super-natural source vaguely identified with a jinn or a devil. But the conception about his art was the same as about the skill of a horseman, it had to be consecrated entirely to the cause of the solidarity and the ascendancy of the tribe. The poet had a task irrevocably assigned to him, which was to act the spokesman and the counsel on behalf of the tribe.

Hence, he was expected to specialize in a knowledge of the tribal saga supporting the cause for his clients and against their rivals.² In short, poetry was appreciated primarily as a weapon of offence and defence in the struggle of tribes against tribes; its function was to commemorate the glories of the poet's own tribe, exalt its achievements in war and peace, and embolden it against the other tribes by holding them to scorn. There was little room for the personality of the poet to detach itself even for a while from the interests and the fortune of the tribe.

Naturally enough, the motifs of pre-Islamic poetry sprang fundamentally from the spirit of the jahiliyyah - the ignorance of a moral code of conduct characterized by a strong sense of tribal solidarity based on blood kinship, and highly volatile passions cramped within stunted sympathies and primary selfish impulses.³ Thus, the two oldest kinds of verse were the *hija'* (satire) and the *fakhr* (self-glorification) with the keynote of the *hamas* or desperate pursuit of unbridled aggression. True, the *nasib* (erotic verse) also must have had an independent form in the oldest time but all the same it could not have occupied a position other than the subsidiary one which is assigned to it in

the scheme of the qasidah. After all, the theme of love had no bearing on the security of the tribe. The very reason that its interest was human and universal, i.e. not peculiar to the tribe, was enough to render it inconsequential.

Leaving aside the *hija'*, which has throughout maintained its independent form, the *fakhr* in its kindred form of *madih* (eulogy) came to assume the pivotal position in the structure of the qasidah, which was devised especially to rope in the *nasib* and many other minor forms of occasional verse to subserve it. This "loose-knitting" of the diverse kinds into a rigidly conventional structure seems to have come into vogue not long before our earliest acquaintance with Arabic poetry, i.e. about 125 years before Islam.⁴ The order in the composition of the qasidah is invariably as follows. First comes the *nasib* by way of a prelude, second, the *madih* as the main part, and third, the *khatimah* (epilogue) which is most didactic. A certain proportion was observed particularly between the first two parts on the principle that the *nasib* should neither over-shadow the *madih* nor pass without fulfilling its function of catching the ear of the audience for the latter.

The Nasib

Usually the poet pictures himself as confronting, in the course of his journeys to and from, the remains of the encampment which once had been the scene of his love. This gives him the opportunity to depict with remarkable pathos the scene of the separation and recollect in moving terms the charms of the beloved and the pleasures of her company in the past. The physical charms are dwelt upon with much gusto and not a little sensuousness. The discreteness of the Arab mind is amply shown in concentration on the individual parts of the body one by one.

To take just one typical instance, the Arab poet has a long breath in expatiating on the saliva - its purity, coolness, freshness, and fragrance like that of "early morning rain collected in a clear stony pond" - which nectar he would suck, draught after draught, with the zest of a drunkard in order to convey the meaning of the simple word "kiss." A life free from hard work is idealized for its effect in promoting feminine delicacy and untarnished complexion. To stay behind the curtains, well protected from the rigours of the weather, and jealously guarded in the manner of "the delicate shell of an egg under the feathers" was the vision which enthralled the heart of a young damsel.

Qualities of heart, particularly modesty, gentleness of manners, friendliness towards neighbours, and mirthful coquetry in the company of the lover, are also highly appreciated but only as adjuncts of physical beauty. Having perforce to suffer long spans of solitude due to unsettled life, the Bedouin acquired high sensitivity to any stimulus to his memory.⁵ Hence addresses to the natural surroundings associated with the exploits of the past and outbursts of sympathetic response to the cooing of the dove and the like are an ubiquitous feature. Further, it was the relish for musing which earned for the image of the beloved (*khayal* or *taif*) a special place in Arabic poetry.

The poet's feeling of love for the beloved is expressed only in general terms such as the comparison of his own heartache to that of "a she-camel who has lost her young." For the rest, the pursuit of love is only reminiscent of "the hot chase of a game." The only relieving feature is that of the Arab lover insists on a response to his love, and that without any trace of cringing. He would start taking pride in his own qualities so as not to leave any doubt about his deserts for the esteem of the beloved, but in the end he would not mind warning bluntly that although he relishes coquetry he cannot brook any affront to his dignity. That is why in describing the union he would take care to mention the yielding, passive and tacit though it may be, on the part of the beloved.

Incidental to the journeying of the poet in quest of love and fortune comes the description of the animals and the natural scene. It has been said that the camel occupies the same place in Arabic poetry as the cow in the Rg-Veda. The horse, no less indispensable for the normal pursuits of life including war, comes next. Though the description came soon afterwards to sound jejune even to the townfolk of Baghdad, one cannot help being moved even today by the tenderly feeling shown to the two animals which equals to, sometimes even exceeds, that reserved for the members of the household.

To bring out certain points of comparison in the riding beasts, the poet turns to the wild animals, among which the pride of place goes to the wild ass, the wild cow and the ostrich. The subject of wild life is frequently enlivened with fine thrilling scenes of flight and chase. The natural scene is, of course, dominated by clouds, thunder, lightning, rain and the mirage, not to speak of the desert and the mountain valleys.

The Madih

The nasib formed only a prelude to catch the ear of the audience, the main theme being the madih. Though in the form of personal eulogy, it is really a concentration of the pride in the tribe. The particular patron to whom the verses are addressed is a mere peg on which to hang the ideal that united the tribe as against other tribes. The so-called virtues constituting this ideal are, in addition to the hamas already noted, the over-powering passion for vendetta, loyalty to friends and allies (and not to any moral law or civic organization), and hospitality to guests. The pride in valour was so all-engrossing that the dictates of prudence always needed a special and somewhat diffident, pleading.

But, as a rule, the Bedouin considered it below his dignity to try strength with an unequal foe, which is reflected in his acknowledgement of merit on the other side. Those who refused to be restrained by the collective interest and initiative of the tribe in practice of these same virtues were designated the sa'alik, i.e. disowned outlaws, whose production bears the exceptional feature of defiance of tribal authority and extra hardihood. Hospitality and generosity were characterized by the same excesses as courage and aimed only at achieving prominence over other tribes. With the transition from tribal into some kind of State organization as, for example, at Hirah, the panegyric tended to be more and more personal and acquired features of flattery.

The Khatimah

The didactic epilogue was devoid of any depth of thought and merely embodied lessons learnt from practical experience in the particular and limited milieu. Religion sat very lightly on the pagan Arab, some occasional references to pre-Islamic ritual only prove that it was treated as part of an inherited tribal custom⁶ without symbolizing any moral ideal. The absence of religious thought and feeling is fully confirmed by the total lack of reasoning of any kind whatsoever.

Death is frequently mentioned as a stark fact, but it only stimulated bravery, rather rashness, on the battlefield, on the one hand, and a sort of hectic hedonism in the intervals of peace, on the other. It is in this context that the poetry of Jewish and Christian poets and such pagan poets as were influenced by their thought (e.g. Zuhair and the Hanifs) assumes a distinctive character. The idea of submission to a Supreme Power controlling man and the universe, a life after death involving moral retribution, and a spirit of peace and respect for the rights of others (the very anti-thesis of hamas) stand out as streaks of early morning light in the surrounding darkness.

Such poetry flourished mostly in Hirah and the oasis towns like Yathrib and al-Ta'if, which were also the centres of material civilization. Hence truly religious thought and emotion are found side by side with exhilarating pictures of urban refinement in luxury as in the poetry of 'Adiyy b. Zaid. It is noteworthy that the Romans and Christians were throughout, from the beginning down to the 'Abbasid period, the purveyors not only of wines but also of the etiquette of wine-drinking.⁷ Anyhow, wine-drinking had become a common habit. On the other hand, artistic music and dancing, so far as they are mentioned in pre-Islamic poetry, are mere clichés popularized by individuals who had occasions of frequenting centres of high life under Persian and/or Roman influence. Both these arts were neither indigenous to nor common in the Arabian Society of the days before the Islamic conquests.

The qasidah presented a series of thoughts moulded in self-contained verses strung together in the most impressive form of a single metre and qafiyah. A thought running into more than one verse was a rarity and regarded somewhat as a weakness of the poet. But one wonders whether the outward unity which was so perfect as to invite the charge of monotony from the uninitiated possessed also a similar unity of thought and ideas.

The fact is that there was enough of coherence internally within the two main parts, viz. the nasib and the madih, though the appreciation of it depends upon a certain degree of familiarity with the pattern of life and the train of thought and feeling generated by it. It was only the transition from the first to the second part which was rather abrupt, either lacking a link altogether or depending upon one which was clearly artificial and weak. It is, however, untrue to say that the Arabs were not conscious of it; on the other hand, they were throughout applying their ingenuity to husn al-istitrad (grace of digression).

Similarly, there is no doubt that the ideas as well as the modes of expression were stereotyped, but the primary reason for it is to be sought in

the physical existence of the Arab Bedouin which was characterized, above all, by little variety. The pre-occupation with a hard and meagre subsistence in a monotonous natural scene contributed to averseness to all serious reflection and to poverty of theme. At the same time the totalitarian demands of tribal loyalty left little room for indulgence in personal experience or individual reaction. As soon as thought was quickened by spiritual impulses from Judaism and Christianity and the monotony of life was relieved by the encroachment of Aramaean and Persian material civilizations, the structure of the qasidah proved accommodating enough to change.

In addition to *hija'*, there was one more form of artistic poetry, namely, the *ritha'* (elegy), which maintained its position independently of the qasidah. Although this form too had its own clichés and was dominated by the spirit of *hamas* and the passion for vendetta, yet the element of strong personal emotion running through it is often genuine and highly remarkable. It is this reliability of the personal element which brings to the fore the strength of the lament of the sisters as compared with that of the wives, which is again a projection of the all-powerful importance of blood kinship.

The tradition has concerned itself only with the preservation of artistic poetry,⁸ unconventional pieces prompted by events of everyday life were allowed to lapse. Yet a number of them noted for wit and humour (*al-mulah*) are available for enjoyment on informal occasions.

Islam and Poetry

Wherever the ideals of the jahilliyyah suffered a decline owing to the growth of a sense of justice and corporate life under some kind of civic and political organization, there was left little scope for self-glorification at the expense of others (i.e. *hija'*, *fakhr*, and *hamas*). Al-Jumahi makes an interesting point when he attributes the paucity of poets and the meagreness of poetry in the tribe of Quraish already before the advent of Islam to a sense of respect for the rights of others as exemplified by the incident arising out of the lampooning by *ibn al-Zib'ara*.⁹

Thus, pre-Islamic poetry being so dependent on tribal wars for its impulses and motives, Islam was bound to make the ground slip under the feet of the poets. As soon as the faithful renounced all pride (*al-nakhwah*) and blind partisanship (*al-'asabiyyah*) in favour of a universal egalitarian brotherhood and organized their life under a government by-law, which guaranteed mutual rights and obligations, eliminating resort to force, and treated satire as punishable libel, the poets naturally felt that their day was over.

Unable or unwilling to appreciate any ideal of morality, they turned their invectives against the person of Muhammad and aligned themselves actively on the side of his opponents. It was such poets, and not poets or poetry in general, who were denounced in the Qur'an as incapable of leadership due to lack of moral thinking and purposeful activity.¹⁰ Severe penalties had also to be meted out to a number of them such as Abu 'Azza, al-Nadr b. al-Harith and Ka'b b. al-Ashraf - all of whom had played a part as active competitors while using the art of poetry as an additional weapon directed

especially against the person of Muhammad, whose kindness they were not loth to exploit whenever they found themselves helpless.

But the reason for the vehement pique and chagrin of the poets against Islam went much deeper. The ideals of the jahiliyyah were not the only thing involved, their art itself was threatened with dislodgment from the position or supremacy enjoyed theretofore. Was there not the Qur'an held up as a challenge to artistic composition? It is quite understandable that the Arabs should be completely at a loss to place the Qur'an in any of the categories of artistic composition known to them. They would call it al-shi'r (poetry) when their own poetic production was so palpably different from it both in form and content.

Only poetry had been known to exercise such sway over the minds of the people as the Qur'an did. If it were not poetry it could only be grouped along with the utterances of a soothsayer (kahin) or a person in trance (majnun). This equation, however, had an ostensibly disparaging intent inasmuch as such utterances were seldom held in high esteem as a piece of art. The allusion was only in their enigmatic character in which the people deciphered fortune and prophecy. When at last they turned to the content, they gave unmistakable proof of their jahiliyyah outlook on finding the Qur'an to be merely a bundle of "the stories of the ancient peoples" (asatir al-awwalin).

Soon they propped up one of them, al-Nadr b. al-Harith, to draw the people away from the Qur'an with his skill in reciting the stories of Rustan and Isfandiyar. As a matter of fact, the form of the Qur'an is derived from a familiar pattern, yet it represents a new class by itself. It is prose composed of short, compact sentences which, when read together, sound as balanced counter-parts (mathani), The endings (fawasil) of them having a distinguishable cadence free from the shackles of a regular saj'. It bewildered and dismayed the Arabs that this form which, in contrast with the familiar pattern of the soothsayers, tending to simplicity rather than artificial encumbrance, should soar to such height of inimitable perfection as to constitute a challenge to poetry.

The same is true of the diction employed in the Qur'an: it is clear and easily intelligible (mubin), yet pure and elegant. But whatever the elegance of form and diction, the uniqueness of the Qur'an lay particularly in its content, the reflection on the world of nature as distinguished from an aesthetic worship of it, the search for a goal of life and an ideal of morality in human conduct, in short, the awakening of the forces of good in the nature of man to set limits to, and control, the evil in himself. It was this content which made the Qur'an the prototype of an entirely new class of literary composition. In later times it was an aberration of the pre-Islamic taste which exalted the excellence of the word over and above that of the content.¹¹

It is quite easy for us to realize the dismay of the poets whose production, when judged subsequently by the standards of the Greek philosophers, was found to be nothing but an exhortation of lewdness, only two qualities of character, namely, bravery and generosity, were such as could be said to be harmless to the youth. But the Prophet appreciated their art much more than

they realized. He could not taboo poetry; rather, he would listen eagerly to the verse of Umayyah b. Abi al-Salt and many others. He was not even indifferent.

On the other hand, he adopted the way of active patronage and guidance to make clear the demands for adjustment. As an example, let us take the case of Ka'ab b. Zuhair. The ode which brought him the burdah (mantle) as a prize is in the traditional style. It opens with erotic verses lamenting separation from the beloved, Su'ad, and recalling her physical charms, not excluding the intoxication of the saliva compared to wine. The madih puts a new aspect in so far as the glorification of the new ideal is concerned.¹² But the poet did not yet know how to restrain his passion for satire; he had to make amends for suppressed expressions on the Ansar.

Thus, the only demand made by orthodox Islam on the poets was to avoid the proud and gleeful recounting of adventures of sinful pleasure such as abound in the verses of the "Vagabond Prince," and to refrain from indulging in tribal pride or exaltation of force regardless of moral rectitude.¹³ Within these ordinary limits of decency and peaceful life the old literary traditions were to survive and grow. It has particularly to be noted that erotic interest in woman or even the mention of wine as a symbol of joyful experience was lawful pursuit, and not in renunciation, of sensuous pleasure. As the examples of Dabi' b. al-Harith and al-Hutai'ah would prove, only the satire and the libel were sternly put down.

Development of the Ghazal

The detachment of poetry from the passions and the fury of tribal antagonism as well as the absence under the Orthodox Caliphate of that corruptive patronage which draws talent away from the universal human interests to flattery of personages, conduced inevitably to concentration in the theme of love in poetry and song. These arts were cultivated in the Hijaz by the sprightly and intelligent youth from among the nobility of the Ansar and the Muhajirin, who were precluded from playing their part in politics and government and were at the same time pampered with frequent accessions to their already vast hereditary fortune in the form of largesses on behalf of the Umayyads.

Thus frustration, leisure, and opulence all combined to turn the creative genius to art and amusement. The peculiarly Islamic institution of rehabilitating the prisoners of war as members of the households of the conquerors, instead of segregating them in penal camps, has always had far-reaching consequences, in the field of cultural inter-change but never were such consequences so great as in the case of the conquest of Persia. Suffice it to say that it was the new Persian element in the households of Mecca and Medina which for the first time introduced artistic music and dancing in the very heart of Arabian society.¹⁴

In the special traditions of the people and the time, there was no music and dancing without poetry. Therefore, poetry underwent a highly welcome and profound change both in form as well as content. Whereas in the jahiliyyah period the motif of aggressive self-glorification often made some of the more militant tribes positively to discourage the ghazal, it now came to be the main theme catering to the refined aesthetic taste and tenderly

feelings of the new society. Naturally enough, the erotic prelude came in hand for development as an independent form, which, by the way, marked the beginning of the breaking up of the “loose unity of the qasidah.”

The development of the independent form of the ghazal took two distinct and parallel lines. First, the licentious (al-ibahiyy) ghazal, best represented by ‘Umar b. Abi Rabi‘ah (d.c. 101/719), flourished in the towns and faithfully reflected the high life obtained there. As compared with the pre-Islamic nasib, this ghazal is an end in itself. The poet is no longer a warrior made essentially of hard stuff, who snatches a few moments of respite to devote to the hot pursuit of a woman. Rather, he is an amiable and amorous youth entirely devoted to the cultivation of his feeling of love and desire for soft dalliance without being distracted by any thought of tribal security and personal safety.

The description of physical charms is no more a mere description; it is rather a fine aesthetic appreciation of beauty. Still more remarkable is the shifting of the focus inwards and the transformation of the union into an exchange of feeling and sentiment.¹⁵ And both the lover and the beloved are endowed with sharp wit, humour, and the mood for sport. In short, the qualities of the mind and the longings of the heart come to the fore and find unimpeded expression. Special delight is taken in the evasion of social restrictions and the celebration of clandestine visits while the congregation at the time of the hajj is brought in as the connoisseur’s opportunity for the enjoyment of beauty from near and far.

The second kind of ghazal was born of the ideal of Platonic love cultivated in the desert. The chastening influence of the restraints of Islam on the simple-living Bedouins had the remarkable result of originating the conception of love shorn of all tinge of bodily lust - an ideal conception thoroughly unknown to the pre-Islamic Arab. This ideal is enshrined in the highly subjective verse centring on the popular stories of Majnun-Laila and Jamil-Buthainah. They may or may not have been real historical personages; what really matters is that they do represent a type of idealistic lover who regards any touch of lust as desecration of love, beauty, and art. No wonder that the physical charms are over-shadowed by a tete-a-tete between two hearts full of deep pathos.

Vilifying Ghazal

It has already been noted that the lover-poets of the towns were really men of frustrated political ambitions. Their impotent rage against the rulers would not be held back even when they sought to beguile it with art. Rather it is highly interesting to note that it should turn the artistic form of the licentious ghazal into an instrument for vilification and political vendetta. Taking the typical example of ibn Qais al-Ruqayyat (d.c. 80/699 - 700) one finds him mentioning Umm al-Banin, the wife of Walid b. ‘Abd al-Malik, as the object of his flirtation. His aim was no other than to leave the Umayyad monarch smarting with anger, even though sometimes he adroitly contrived in the verse itself to absolve the innocent lady of guilt.

Apart from political vendetta, it became a commonplace with the poets to give rebirth to *hija’* in the form of ghazal by mentioning the ladies and the female relations of their enemies in shamefully amorous terms. How

unrelated to truth all this was, is illustrated by the incident of Umm Ja'far. When she could not keep patience over al-Ahwas, a Medinese poet, mentioning her in his verses in order to bring her people into disrepute, she caught hold of him one day in the market-place and demanded of him the money which, she made out, he owed to her. As the poet swore that he did not know her at all, she remarked, "Of course, you do not know me, yet you mention many things about me in your verses."

It is no surprise that State authority was sometimes invoked against such poets in the same way as it was invoked in the case of the direct *hija'* of al-Hutai'ah and others. At the same time there is evidence to show that at least the high-class ladies aspired to have their charms sung by the poets in the same way as in our own days they would feel proud to see their photographs in newspapers. It must, however, be remembered that, on the whole, "licence" was confined to a disregard of social conventions relating to contacts between the two sexes; otherwise, obscenity was guarded against in all good taste.

In regard to form, it is enough to remind ourselves that the lover-poets of Mecca and Medina produced for the first time a lyric verse especially designed to be set to music. With this purpose they naturally referred such metres as were short and characterized by an easy flow, though they continued to rely mainly on the old tradition itself. Consequent upon the development of natural, humanistic interests, all artificiality about the language and pompousness was shed and simple unaffected expression in familiar words and soft tones came to be aimed at. To some, though very limited, extent, continuous verse also came into use for such purposes as the reproduction of dialogues in love-poetry.

It so happened that the merits of the Umayyad poetry set out above received little appreciation owing to the pre-occupation of the scholars with such pre-Islamic poetry as might be helpful in the study and preservation of the idiom of the Qur'an. With regard to its appreciation, the time factor alone was the prime importance; hence the prejudice in favour of the pre-Islamic verse became stereo-typed and all pervading. It was ibn Khaldun who first realized that, linguistic research apart, the intrinsic artistic merits of the Umayyad poetry were definitely far superior to those of the pre-Islamic poetry.

And the reason for it was that those who lived under Islam benefited from the model of high class speech provided by the Qur'an and the Hadith; hence, their literary taste improved a great deal beyond that of the pre-Islamic people. That this improvement should have taken a generation to manifest itself fully in poetry (and also in prose), was quite natural and should not stand in the way of tracing it to its origins in Islam. The depth of thought, the richness of imagination, the paramountcy of content, the search within for the feelings of the heart, and the consciousness of the restraint of reason, and its Holy Book, and these general qualities are perceptible in the post-Islamic production even where the themes are un-Islamic.

It was perhaps this un-Islamic element such as the "licence" in *ghazal* and the lampooning in the *naqa'id* which, in addition to the necessities of linguistic research, turned the attention away from the contribution of Islam

to the literary production of the Umayyad period. Ibn Khaldun further tells us that some of the learned scholars of his time had to acknowledge their dormant impression of the superior merits of the post-Islamic production, as if it were to their own surprise, but were unable to give any reason for it.¹⁶ No wonder that the view of Ibn Khaldun should remain unattended until it found an echo in Taha Hussain, although the latter's judgment seems to have been the result of the application of the modern standards of literary criticism in the West.

If one were to look for the dominating motif of poetry in Islam itself, it will be found in the verses of the Kharijites. Their production represents a characteristic regimentation of the pre-Islamic qualities of hardihood, courage, and sacrifice in the service of the ideology of Islam. Just because it is as true of life as the poetry of the pre-Islamic age, the new spirit, ideals, and sentiments are clearly discernible. Yet it symbolizes, according to the cultural milieu of the Kharijites, the purely ancient Arab tradition as mellowed by the Islamic Puritanism.

Most interesting is the survival without any loss of attraction of the erotic theme in a society where even the "talk" of wine or a mere hint of laxity in relationship between the two sexes was an unpardonable offence. Equally notable is the spirit of martyrdom which would not allow virility to be impaired by a relish of tragedy and pathos for their own sake.

While under the Islamic influence poetry was set on its course of development along natural, humanistic lines, the corruptive patronage of the Court stepped in to revive the old tribal antagonism and buy off unscrupulous, though talented, poets to act as its propagandists. Thus the trio - Farazdaq, Jarir, and al-Akhtal - attained high fame in the field of panegyric and lampoon. They couched praise for the Umayyads as well as invectives against their opponents in the true form of the qasidah with its carefully chosen diction and high-flown style. The Christian al-Akhtal, who, by the way, was considered to be free to revel in wine without offending Muslim piety, was also remarkable for his willingness to step in where a Muslim, irrespective of his alignment, feared to tread, namely, the satire against the Ansar. The counter offensive from the other side showed a much more genuine feeling of devotion not only to the House of the Prophet but also to the ideal of justice and public weal popularly associated with it.

The contrast between the settled life in the towns and the Bedouin ways of the desert has throughout been a powerful factor in Arab thought and history. Islam, with its marked predilection for congregational activity, accelerated as never before the process of drawing emigrants from the desert, who flocked into the towns to enlist in military service, State organizations, and economic activity. This created nostalgia in the mind of some poets who introduced a new theme, viz. the comparison of new life, including the charms and manners of the damsels of the towns, with the old ways of the desert.

Even in regard to the qasidah, though its conventional form remained intact, the new pattern of society changed the modes of thought and the manners of expression sufficiently to render the purely Bedouin tradition a mere curiosity. This curiosity had its last protagonist in Dhu al-Rummah (d.

117/755). It is somewhat in the same spirit that the oldest and the simplest form of rajaz were employed in long qasidahs pedantically over-loaded with rare vocabulary.

The ‘Abbasid Era

With the advent of the ‘Abbasids the corruptive patronage of the Court, which siphoned poetic talent into the madih, expanded to such an extent that only a few could keep themselves free from it just because they were consciously determined to do so. Curiously enough, as the Caliphate declined it only led to a multiplicity of such centres of patronage and thus the servility of the poets went on increasing further and further. At any rate, the growth of luxury and the enrichment of culture from foreign sources were bound to seek an outlet in new forms and modes of poetry.

Fortunately the traditional qasidah did comprise within its orbit a large number of themes concerned with peaceful enjoyment or warlike activity, which, in their developed form under the Empire, now claimed separate treatment. All that required was to salvage the various themes from regimentation by all the engrossing passion of tribal solidarity as signified by the supremacy of the madih. This process, which started with the development of the ghazal under the Umayyads, took its full course in the following era until all the topics treated incidentally in the old tradition branched off into independent kinds.

Further Development of the Ghazal

It will be remembered that Islam, not being a monastic religion, regards woman not as a taboo but as one of the three things dearest to the Prophet. Thus, the theme in itself, far from offending the moral sense, was particularly compatible with Islam’s bold affirmation of nature. Significant is the use in the Qur’an of this very imagery of woman and wine for the conveyance of an idea of the highest bliss in the heavens. It must, however, be admitted that a certain degree of licentiousness has actually attended upon the development of the ghazal from the very beginning.

Towards this element of licentiousness the early Islamic society adopted an attitude of practical toleration as apart from official recognition; it was only the personal scandal which was generally condemned by the people and sternly curbed by the State. This tolerant attitude is best embodied in an incident at the Court of Sulaiman b. ‘Abd al-Malik. Once when al-Farazdaq recited to the monarch such verses of his as amounted to a confession of adultery, the monarch perhaps could think of no better way of expressing his appreciation than to embarrass the poet with the threat of legal cognizance and penalty.

But calmly the poet asked him, “The sanction behind the penalty?” “Of course, the Qur’an,” replied the monarch, whereupon the poet retorted, “All right, the Qur’an itself assumes my innocence when it says of the poets that they ‘celebrate in speech what they do not practice!’”¹⁷ Truly, there is much more than wit in the argument of the poet; it gives pointed cognizance to the fact that a poet relies mainly on his mental experience. Practical experience has no essential bearing on art; rather, it is a matter of personal character.¹⁸

In the words of Nuwas, one can safely and effectively “talk of fire without burning one’s mouth.” Thus cultivation of the erotic verse, including the licentious ghazal, originated and flourished vigorously under Islam in public circles. But as soon as it was transferred to the royal palace it suffered from the same servility to the over-indulged baser instinct of the patrons as the madih in relation to their inflated sense of vain-glory. At the palace the poet was promoted to the position of boor, companion who shared the privacy and the intimacy of the patron, and enlightened, diverted, and amused him with appropriate citations, impromptu compositions, and ready wit.

It is legitimate to link this institution with the life of the pre-Islamic poet, al-Nabighah, at the court of Hirah, but one has to take note of the steadily increasing dissoluteness and sexually exhibitionism which began with al-Walid II and reached its climax in Abu Nuwas.¹⁹ This exhibitionism was designated separately as al-khala’ah al-mujun and was relished only in the company of intimate friends as a source of enjoyment. From the palaces it percolated down to public circles and was preserved only for the sake of witticism and elegance of language - obliquity it was condemned outright as obscene and in sheer bad taste.

Bohemianism

In public circles the joys of life were idealized in terms overtly disdainful of moral restraint under the pressure of another set of circumstances in which national and political rivalries played a significant part. It has been noted above that in the initial stage licence in poetry was treated apart from the personal character of the poet. But gradually the poet’s own guilty conscience and the general social approbation caused him to introduce in poetry itself some sort of defence of his own promiscuous way of life. This involved an active propagation of the disregard of social and moral values, scorn for the religious preceptor, an invidious lack of faith in after-life and at the same time a somewhat philosophical justification for the excesses from God’s quality of “forgiveness.”

Even this development left the larger section of society unalarmed; it was taken merely as an exercise of wit and humour. Soon, however, there was a further development in the peculiar atmosphere of Baghdad which was torn by Persian-Arab rivalry - a rivalry fanned by the alignment of the Persian element with the ‘Abbasids. In Baghdad certain types of literary Bohemians, mostly Persians, organized themselves into cells or clubs where wine, women (those of a low status, of course) and poetry full of sarcasm for the orthodox way of life were zealously enjoyed. From apologetics it now passed into the phase of active glorification of practical libertinism.

And all this was done in a spirit of arrogant demonstration of the intellectual refinement and cultural superiority of the Persians so much so that zarf (quickness of wit) came to be proverbially associated with this class of proud libertines - zindiqs as they were called.²⁰ Although it is very doubtful that many of these Bohemians were genuinely devoted to Zoroastrianism or Manichaeism as against Islam, it is a fact that some of them were bold enough to mention the names of Zoroaster and Mani as the

Bacchul-like patrons of libertinism as against the restrictions on pleasure symbolized by Islam.

Anyway, there is little doubt that this cultural arrogance was linked with the aspiration to greater and greater political control, which made the 'Abbasids closely watch and suspect their own supporters. While the public were left speculating as to the cause of the sudden downfall of the Barmakids, a methodical zindiq-hunt was set afoot, the verses of the poets were incriminatingly dissected at ceremonial trials and the guillotine applied to the partners in the widespread net of conspiracy.²¹ Thus the poetry of Bashshar (d. 168/784) came to be typical of that pursuit of refinement and culture which is associated with the enjoyment of woman and wine and their celebration in arts and song enlivened by wit, humour, and sarcasm on social and moral restrictions.

Before we pass on it has to be added in regard to these libertines that their fund humour and sarcasm was not exhausted in their engagements with the opponents, their unprincipled levity often caused them to exercise the same resources against one another. Hence, most of them have the reputation as satirists as well.

New Features of the Ghazal

A few special features of the new ghazal under the 'Abbasids have to be noted. First, there was the addition, almost substitution, of the male for the female object of love. It must be admitted that it almost amounted to a common social vice attributable to Persian influence. Secondly, a refined taste in similes and metaphors and the subtlety of imagination in general are also traceable to the same source. Thirdly, though gleeful descriptions of wine were quite old in Arabic poetry, the subject came now to be cultivated as an independent art. As with the theme of beauty so with that of wine; it is no longer a mere description of the transparency of the glass, the colour of the wine, the various stages of brewing, and the haggling of the wine-seller over its price, nor is wine-drinking a mere appurtenance of nobility.

The emphasis now is on the inner sensation of abandonment and revelry experienced by the drunkard. Lastly, one has to take account of the special characteristic of Islamic society which causes even renegades of the type of Abu Nuwas to be over-taken by remorse and pious reflection in old age. Hence, al-shaib w-al-shabab (old age and youth) developed into a recurring and semi-independent theme closely associated with the nasib. It is characterized by recollections of the pleasures which are no more than reach or capacity - a feature inherited from pagan poetry. Under the influence of Islam it was complemented with a desire to make amends for the erroneous ways of the past.

Moral, Philosophical and Mystic Poetry

It would be a very lopsided view indeed if we imagined the 'Abbasid society to be merely that which is pictured by the boon companions of the elite and the Bohemians of the metropolis. Religion and morality had their own devotees and champions in no way negligible either in numbers or in importance. In the very nature of things, however, religion, as apart from religious sentiment, could not be cultivated in poetry. Morals formed a fit

theme for poetical art. They also had a precedent in the so-called wise sayings of the pre-Islamic poets, though these latter were entirely devoid of any element of reasoning in them.

Abu al-‘Atahiyah (d. 213/828) introduced moralizing verse characterized by thought and reflection but it was because of this very new basis that it came in for reserve and suspicion. Also, it inevitably involved criticism of the prevalent modes of society. Abu al-‘Atahiyah sometimes appears as the spokesman of the down-trodden masses bringing to the notice of the Caliph their economic plight and difficulties. Most unfortunate of all, the entire theme was permeated with a mood of pessimism which persisted and was steadily augmented by the influx of philosophical ideas and monastic tendencies.

Philosophical poetry reached its highest achievement with Abu al-‘Ala’ al-Ma‘arri (d. 449/1057), who made a frontal attack on all religions as such and exalted reason in opposition to revelation. Yet he remained the pessimist par excellence. His eclecticism also centred on the austere as exemplified by the particular features of Indian philosophy proved no more delectable in verse than religion. Even though Abu al-‘Ala’ was a master of literary arts, his philosophical poetry remained a simple statement of judgment and argument unclothed in poetic imagery; hence, it provided enough justification for denouncing it as “no poetry at all” (ibn Khaldun).

His resort to jugglery with words is also a further proof, if proof were needed, of his woeful failure to devise a truly poetic form for the presentation of his philosophical thought.²² That is why his poetry seldom achieved any high degree of popularity, though he was, and has throughout been, highly respected as a scholar. It is wrong to attribute this to the prejudice against the anti-Islamic ideas contained in it. Had it been so, the production of the libertine poets would not have fared any better.

The true reason is that Abu al-‘Ala’s poetry was bare of essential poetic appurtenances. In the words of an Arab critic, the art of poetry consists in making a thing appear beautiful: the intrinsic beauty of the thing or the idea would not make up for any crudity of presentation. The libertine poets were accomplished masters of this art of presentation; hence, unlike Abu-‘Ala’, they were widely enjoyed but seldom respected.

In contrast with philosophy, mystic ideas belong essentially to the theme of love and naturally command for their expression all the paraphernalia of love and poetry. The high sentimentalism of the mystic poets was enough to ensure for them a strong popular appeal, in consequence of which they came in for persecution while Abu al-‘Ala’, a lone voice, was left comfortably alone. Again, we have to note that, significantly enough, the popularity of mystic poetry survived all questioning of the orthodoxy of its contents and even the attacks on the person of the mystics.

But the excessive sentimentalism of the mystic poetry centring on the beatific vision is such as to have a lamentably adverse effect on the search for clear, practical ideal of life and the urge to realize it through activity. The passivity of an intoxicated visionary, as opposed to the ardent activity of a devoted missionary, formed the keynote of it.

Formal Panegyric

Apart from the lighter side of the life in the privacy of the palace, which was shared and recorded by the nadim-poet, there were many formal occasions and official assemblies at the Court when the emphasis was on decorum and dignity. On such occasions it was the strictly conventional form of the madih, the qasidah, which was in vogue. In view of the rigidity of its forms had already noted, it is no surprise that it required the highest skill to handle it with success. In any case, the monotony of the stereo-type could only be made up with hyperbole and rhetorical tropes of all kinds. Some pedantic display of logic and philosophy was also introduced as a novelty.

As these formal panegyrics were designed in the manner of the party press of our own day to exalt the powers that be in the eyes of the public, naturally enough they were replete with references to the political ideology - often bound up with specific religious belief and dogma - of the ruling dynasty as, for example, the claims of the 'Abbasids vis-a-vis the 'Alids. But, while there were scores of those who for sordid gain served as mere trumpeters, there was no dearth of those who spoke from conviction. And in fairness it must be said that the conscientious objectors on the side of the opposition were given a long rope only if they had the courage to forgo the patronage of the Court.

It was also in this traditional form fit for themes of grandeur and no levity that the incidents of the wars were pictured. They came to be particularly relished by the Bedouin spirit of the Hamdanids under the shadow of the Crusades. Another theme cognate with it was that of the prison-poems (al-habsiyyat) best represented by Abu Firas (d. 357/968). They are an impressive blend of nostalgia for home, pathos of suffering, and indomitable courage.

Complaint against Time (Shakwah al-Zaman)

Perhaps the most depressing aspect of the poetry of these times is the common expression of dissatisfaction with one's lot and a feeling of insecurity in respect of life, property, and position. As undeserving people enjoy wealth and power and real merit is neglected, nay persecuted, consolation is sought in the acceptance of this state of affairs as the "way of the world" - the decree of fate beyond the control of man.

There was no such dominant note of despondency and helplessness when the pre-Islamic poet occasionally bemoaned the inscrutability of fate (jadd) and the failure and his hard struggle (jidd) to bring him the coveted reward. Even in the early days of Islam fate did not appear to be so arbitrary: when there was dissatisfaction it was directed against persons - tyrants and other dynasties. It is only in the late 'Abbasid period that the complaint against "Time"²³ became almost a fashion, so much so that the poets simulated it in the same way as they simulated love.

Personal and Occasional Verse

It was characteristic of the progress of culture that poetry be sought after as the medium of the communication of thought and feeling occasioned by the vicissitudes of personal relations and small incidents in everyday life. The pre-Islamic poet also had frequent occasions to address his "ibn al-'amm" (cousin) in reprobatory terms, but his utterances were deep-rooted in

the actual matter-of-fact struggle for existence. The ikhwaniyyat of the period under review constitute a branch of cultivation of elegance. The difference is the same as between an actual fighter and an amateur sportsman.

The topics range over estrangement, effort at reconciliation, and tickling and teasing through wit and humour. These categories, however, appear to be sham when compared with the impressive genuineness of the pieces relating to incidents in everyday life as, for example, the one attributed to a literatus who was compelled to part with his collection of books in a time of adversity. This kind of poetry concerning the unaffected, natural gushing forth of some poignant feeling or passion aroused by the actual facts of life reached its full development in Spain in general and in the verses of al-Mu'tamid in particular.

A strong element of genuine enthusiasm and personal acrimony is also evoked by the rivalry among the diverse national groups: the Arabs, the Persians, the Turks, the Romans and the Negroes. Pride-cum-satire was the popular form of championing one nationality against the other on the basis of ethnology, history, mental qualities, and cultural achievements. This must be distinguished from the aspect noted above which concerned the exaltation of a particular kind of social and cultural life.

Descriptive Poetry

Beauty no longer remained confined to nature: there were high mansions, fortified castles, exquisite mosques, and public buildings, and, above all, public and private gardens, aqueducts and boat-houses - all claiming attention from the artist and the poet. Even the starlit sky and the cloudy horizon were endowed with a new charm. To the Bedouin they gave only a simple impression of awe and induced a mood of little good cheer; to the Baghdadi who went out for a stroll in the evening they catered to his desire for the enjoyment of beauty. Thus, the descriptive poetry of this period, which often monopolizes the larger part of long qasidahs, is almost something new.

It is exhilarating indeed to find roses being compared to cheeks and tall cypress to the slim stature of damsels rather than vice versa as of yore. Flowers in particular were the craze to the tasteful and the elegant, which even used them as symbols of moods and sentiments in their exchanges of love.²⁴ No surprise that the description of flowers (al-zahriyyat) should grow into a semi-independent branch of poetry in which al-Sanubari (d. 334/945) distinguished himself in the East.

Yet there is nothing comparable to the poetry of Spain so far as high sensitivity to nature is concerned. There the poet not only describes and enjoys nature but also shows himself to be in communion with it. Another branch of descriptive poetry which attained semi-independent form was al-tardiyyat (venery poems). It also reflected an ample measure the trappings of luxury and civilization around an old traditional interest.

Panegyrics on the Prophet (al-Mada'ih al-Nabawiyyah)

As we have seen earlier there was no time lost in celebrating the achievements of the Prophet and composing panegyrics on him in the traditional form and style of the qasidah. When the Umayyads fanned

political partisanship by employing the poets to denounce their rivals, it evoked a new spirit of selfless devotion to the cause of the 'Alids, which found its most forceful exponent in al-Kumait. It soon became a panegyric on the family on the Prophet which was characterized, apart from legal arguments in favour of the 'Alid claims, by a good deal of symbolism of pathos and suffering drawn from the incidents of history.

A concomitant theme of high general interest was the condemnation of tyranny, oppression, and mis-rule coupled with the fervent hope of return to ideal conditions at the hands of the virtuous Imams. The two sides carried on the old bout right through the 'Abbasid period during which the 'Alids continued to be in the wilderness of opposition. In later times when the political controversy lost a good deal of realism and turned into mere sectarian ritual, this kind of poetry was taken over into the circles of the Sufis, who concerned themselves particularly with its content of loyal sentiment and tragic pathos.

These Sufi composers, it will be remembered, were seldom men of high literary attainments nor did they care to examine facts and rely on them alone. Rather they would introduce all sorts of superstition which would feed sentimentalism. A famous example of this kind is the pseudo-Burdah of al-Busiri (d. 694/1294 - 95) which, though not devoid of literary elegance, is typical of superstitious belief and is esteemed primarily for its supposed magical properties.

The framework of these panegyrics being that of the traditional qasidah, the essential prelude of erotic verses was there. It was, however, observed as a convention that in this particular context "love" should be characterized by restraint and dignity rather than "licence." For example, it was specifically disallowed to mention a male object of love or to refer to the hips or the charm of the naked shin among the physical attractions. It will be seen that this only confirms the thesis advanced earlier that erotic interest in woman (without licence) was no offence to Muslim piety.

Still later when originality became rarer the form and the theme of the panegyric on the Prophet were used for the demonstration of one's skill in rhetorical tropes, such qasidahs were designated the badi'iyat. That kind of play with words is, of course, beyond the purview of poetry proper.

Adaptation of Metre and Diction

It was indicated at the very beginning that the metrical forms handed down by the pre-Islamic poets continued to hold their own throughout the classical period. We have only to review the adaptation of these forms to the demands of new developments in theme and style. First, there was the preference of short, flexible metres and then, with the dethronement of the madih, the tendency to short pieces devoted to single or closely allied themes.

However, the only departure from the tradition with regard to the qafiyah was the adoption from the Persian of the muzdawaj, i.e. tanzon with each verse having a separate rhyme for its two hemi-stiches (instead of the whole poem having a single rhyme for the endings of each verse). This was the form attributed to the Zoroastrian scriptural psalms which the zindiq poets were charged with reciting in secret. And obviously this was the form best

suited for the epic which, because of its length, made it well-nigh impossible to sustain one single rhyme-ending.

But though the form of the epic narrative (al-sh‘r al-qasasiyy) was found, the Arabic poets failed to achieve anything remarkable in the field from an aesthetic viewpoint. The early pioneers, ibn al-Mu‘tazz and al-Khuraimi, were tolerably good in picturing national calamities but unfortunately it was now reduced to a mere mnemonic versification of the chronicles of kings and dynasties without anything of genuine poetry about it.

No sooner did the need to please the vanity of the patron disappear than the diction tended to be unaffected, soft, sweet, and naturally fit for the theme and content. Abu al-‘Atahiyah, himself a pitcher-seller, succeeded particularly well in employing the simple language of the common people without any loss of standards. On the other hand, this trend towards the natural and the unaffected suffered some degeneration at the hands of the libertine poets like Bashshar, who did not mind effeminacy and the verbatim reproduction of the idiom of the sporting women in the private company of lovers.

Strophic Verse

It is quite understandable that the need for strophic verse should arise as soon as music and dancing were introduced in Arabia consequent upon the Islamic conquest of Persia. Al-Khalil has left behind a few verses which are like a formula for the rhythmic beating of the feet.²⁵ Further, the attempt to evolve an artistic form for the special purposes of music and dance took the direction of adaptation of the old tradition rather than a complete innovation.

The full length poem was divided into parts consisting of two or more verses, each part having a different single rhyme for its several hemi-stitches but all the parts followed by the repetition of a particular verse with a rhyme of its own and thus held together as if by a string (Ar. simt; hence the device called al-tasmit). This evolution must have taken place at a very early period since it is ascribed without certainty to Imru’ al-Qais. It was the same device which was employed to take greater liberties with rhyme (and also metre) in Spain under the name of al-muwashshah (from wishah meaning girdle).

Later, when the colloquial dialect was fully admitted to this form it came to be known as the zajal. Thus, it came to be an artistic form just free enough to be within easy comprehension and unsophisticated taste of all, yet devoid of none of the essentials of traditional art. From Spain it was brought to Egypt and the East and achieved a high degree of popularity. There were still more spontaneous forms of strophic verse in which the street vendors and the like moulded their cries but in all cases the qafiyah was fully relished and the variety of it in different strophes was compensated with the uniformity of the refrain in between them.

B. Prose

The earliest specimens of Arabic prose coming down to us from the pre-Islamic times fall into the following categories:

1. Proverbs

2. Oracular sayings

3. Orations and

4. Accounts of battles and stories of love, adventure, and entertainment.

Except for the last category the form in vogue was unmistakably epigrammatic and high condensed, consisting of short, cadenced and loosely rhymed sentences. This form was quite in conformity with the morphology of the language and the peculiar temperament of the Arab, particularly in view of his reliance on memory alone for preservation and transmission. No surprise that whatever did not conform to this requirement of form was simply allowed to go by the board.

The oracular sayings were almost lacking in any content whatsoever. If the oracle excelled in anything it was mere adroitness in ambiguity. The most remarkable from the viewpoint of the content were, of course, the proverbs, of which the few highly suggestive words often symbolized a whole story deep-rooted in the simple Bedouin life. Hence, they were early recognized as a source, second only to poetry, for the knowledge of the history, manners, customs, and superstitions of the Pre-Islamic Arabs. In subsequent periods also, there was a remarkable curiosity to pick up pithy and suggestive lines and phrases from poetry and prose and to pass them round in speech and writing. Thus, the stock of proverbs, which in Arabic include idioms and phrases in common use, never ceased increasing and receiving variety from the changes in the pattern of life. Often they mirrored the experiences, complimentary and otherwise, of contacts between the various nationalities.

The orations were designed for actual needs arising out of war-like tribal activity or communal social relationships. Though prose, however, exquisite, was always rated as a lesser form of art, there is no doubt that oration had sufficiently developed into a recognized literary medium. It would also be justified to assume that sermonizing for its own sake, as, for example, on wise conduct and good behaviour had come into vogue.

The evening get-together in the courtyard, generally under the auspices of some generous dignitary, is the age-old manifestation of the Arab instinct for communal social life. The importance of this feature in the hard, matter-of-fact life in the inhospitable desert cannot be over-emphasized. It is also quite understandable that the main diversion on this occasion should be a round of talks on events and anecdotes bound up either with historical curiosity or common interest in love and adventure.

The contents of this samar can be easily be distinguished as (a) the narratives of the battles of the Arabs, (b) stories of love and adventure of Arabian provenance, and (c) stories borrowed from foreign sources. Some traces of the beast-fable have also been found scattered here and there. Nevertheless, pure fables were seldom flair of the Arab mind even in subsequent times. Naturally enough, this evening talk was couched in simple informal language with emphasis on content rather than on elegance of word, and the way in which it has been recorded by the scholars of early Islam can at best be described as quotation from the speech of the narrator.

Influence of the Qur'an and the Hadith

The unique position of the Qur'an as the first book in Arabic has already been noted. It, for the first time, made Arabs fully aware of the potentialities

of prose as an artistic form. Still more important in another way was the normative influence of the Hadith. It is certainly wrong to assume that the influence of the Qur'an was in any way circumscribed by its claim to inimitability because even an unattainable ideal is always potent enough to set the direction of effort in the future. But, of course, there was an air of formality about the Qur'an.

On the other hand, the Hadith represented the model of effortless, everyday speech - simple, terse, to the point, efficacious of purpose, and interspersed with flashes of vivacity and humour. The most important general contribution of both the Qur'an and the Hadith was to drive home the primordial need for setting an aim and a purpose in speech and composition and making both the content and the word fit and conform to the same. The new outlook on literary beauty as related to a definite purpose represented a radical change from the old tradition of aimless talk - "the wondering into every valley" (Qur'an) - and gave birth to a mental discipline which is the hallmark of the orations and the epistolary compositions of early Islam.

The official correspondence of the early Caliphs and their addresses on different occasions of war, legislation, and administration are all marked by a simple and direct style of flowing naturally from high concentration on purpose and thus surpassing all art. Yet they show all the dignity of authority. It will be remembered that orations and epistles were the two branches of literary composition which were especially favoured in early Islam by the needs of administration as well as congregational activity and social life. They only underwent a portentous change at the hands of the Persian secretaries, who introduced in the Arab chanceries all the fanfare of the Sassanian Court by way of pompous language and grandiose style.

Early Works on Adab (Belles-Lettres)

The early literary activity (apart from poetry) concerned itself mainly with compilation and narration rather than personal creation. The scholars and the students were content with collections of texts and explanations of important pieces of poetry, proverbs, orations, sayings of prophets and wise men, historical narratives, and witticism - all considered to be the necessary equipment of polite education and moral instruction. These collections were like packets in which the knowledge of their compilers was lumped together without any systematic arrangement or classification, the compilers themselves contributing only a few comments here and there. Only ibn Qutaibah (d. 276/889 - 90) introduced some order into the invaluable chaos.

The beginning of original production was closely bound up with an interest in man and his natural surroundings. Curiously enough, this interest was roused by the rivalry among the various nationalities within the 'Abbasid Empire. The political and social conditions of the time promoted interesting, even though acrimonious, discourses on the characteristics - physical, temperamental, and cultural - of the peoples of different lands as exhibited in their current behaviour and past history. Al-Jahiz (d. 255/868 - 69), one of the first Mu'tazilites to study the Greek naturalists endowed these discourses with the superb literary form of causerie or short tract characterized by a combination of erudition and artistic skill with the spirit

of reliance on facts of observation and history rather than on speculative deductions.

Thus, highly scientific data, worthy of a Darwin, relating to the processes of adaptation between man and nature, came to form the theme of high literature and art. Al-Jahiz's "Book on Animals" (Kitab al-Hayawan), a fine specimen of the wedlock between art and science, is a definite gain to literature and a high compliment to the general culture of the time. Only one is left wondering whether science would not have prospered better by an early separation from its charming companion.

Popular Anecdote

Beyond the circle of scholars and students the interest of the common people lay in the anecdote couched in simple, unsophisticated language. They sought light entertainment by listening to stories of love or adventure or a blend of both. Apart from the pre-Islamic lore, the wars of Islamic conquest lay handy for the purpose and were especially suited to satisfy at the same time religious fervour, national pride, and the instinctive love of adventure. There is ample evidence to show that the conquests were actually the subject of a saga which, however, could enter the books only surreptitiously.

Two other streams contributed to the fund of anecdotes in the early Islamic period: first, the South Arabian lore in which the Umayyads took particular interest as part of the glorification of the Arabs, and, secondly, the Jewish religious lore which was widely and indiscriminately drawn upon the qassas (religious sermonizers). None of these stories, however, could find artistic presentation because the regard for historical truth prevented their incorporation in book form: the dangers which were guarded against are illustrated by the corruptions that evaded detection and are found today here and there.

Even when they were collected in book form at a very late period and they continued to be regarded below the dignity of a scholar. Of course, the stories of love which are not liable to be mixed up with religion and history were given freer admittance to the literary circles, but even these (e.g. the story of the ideal love of Majnun or the profane love of Waddah al-Yaman) were recalled only with reference to poetry and seldom took any definite artistic form in prose. Whatever form these popular stories possess has only been achieved effortlessly through common repetition.

Story Cycles

The indigenous stories of love alluded to above were simple incidents which could not keep the attention of the samar-hungry audience for any considerable time. As town life grew, the need was felt for cycles of stories or stories within a story, separate yet inter-connected with a string plot which would keep the curiosity on its edge for as long as "Thousand and One Nights." This need was met, in the first instance, by import from Persia, which had long been known to be the store-house for such stories.

The Persian afsanah, the prototype of the Arabic story cycles, had passion, wonder, and surprise as the keynotes of its content, it is the quest for the wonderful and the surprising which brings in super-natural elements

and magic to heighten the effects of adventure, and treachery and moral depravity to enhance love. This element of wilful selection and exaggeration of the unusual in actual life should not be over-looked in making any sweeping generalizations in regard to the state of society. The over-tone is particularly deceptive in regard to historical personalities as, for example, Harun al-Rashid, who though he indulged in luxury and sensuous pleasure in private life, would never allow any lapse from dignity and moral propriety in public.

It was perhaps in the original core of Hazar Afsanah itself that popularly idealized historical personalities were woven into the texture with a view of imparting a touch of reality to the fiction. Yet it is remarkable that this particular branch, as contrasted with that of Kililah wa Dimnah, was successfully cultivated at Baghdad and Cairo. The anonymous maddahs went on dressing up the borrowed material and augmenting it with their own creation until the whole stock was moulded into a more or less fixed but sufficient polished form.

The professionals, whose job was gradually reduced to vocal performance, often to the accompaniment of simple instrumental music, circulated and transmitted the stock by oral tradition among themselves until it was redacted in book form in about the ninth/15th century. The form and the content of these story cycles would be better appreciated if it is constantly kept in view that they were never meant to be read; they were recited to an audience seeking mental relaxation rather than intellectual satisfaction. They were designed simply to amuse and not popularize or criticize any particular view of society. Rather, the surmise is that they were secretly helped into circulation by the powers that were interested in turning the attention of the masses away from political and social problems.

Hence, all the emphasis is on the tempo of action to the subservience of everything else. Further, in the very nature of circumstances, the style and the diction could only be such as were regarded elegant and interesting by the standards and taste of the common people. It really reflects very well on the common culture of those days when people could learn how to appreciate and enjoy elegance of language in their ordinary social surroundings without necessarily studying at school. But after all the story cycles never regarded as a piece of literature (adab) and were never read and taught by scholars as such. It was only in the West that the scholars thought it worthwhile to devote time to the Alf Lailah wa Lailah.

The Siratu 'Antar, another notable work of the same class, bears the impress of conscious art, its texture being loose-rhymed prose embroidered with some 10,000 verses. In point of content, a hero of the pre-Islamic times is made to live through 500 years of Islam down to the Crusades, personifying in himself all the chivalry of the famous knights of Islamic history as well as the legends of the Persian epic. It sprang into popularity in the tense atmosphere of the Crusades and represents fully the peculiar temperament of the time.

High-class Fiction

It will be seen from the preceding two paragraphs that the imagination of the Muslim masses, like that of the masses of any other people, was strongly

tempted to dramatize history and to develop the hard core of facts in fabulous stories. But such a pursuit was totally barred to a Muslim scholar by his high sense of intellectual honesty and academic responsibility cognate with the sanctimonious regard for religious purity. As fiction was disdained and frowned upon by the cultured, it was condemned and relegated to the circles of the common people.

Pure fiction, which posed no danger of distortion to valuable fact, was quite welcome in literary circles. But, again, literati were earnest people who would relish a fable only if it had some moral import in the manner of the stories of the Qur'an. It will, however, be observed that the reliance of the Qur'an on the known incidents of history, rather than fables, to point a moral is highly significant as being in full accord with the peculiar temperament of the Arab. Not that the Arab was weak in imagination; he only considered it somewhat childish to invent fictitious tales, which is best evidenced by the clear absence of a mythology even in the pre-Islamic days.

He was indeed very fond of moralizing but would do so only through direct, pithy, and pointed proverbial sayings supported by illustrations from real life. The style of the Qur'an in this respect stands in sharp contrast with that of the sacred books of India, which seek to convey the truth mainly through fables. Thus, it was only when highly cultured Persians consecrated themselves to the service of Arabic that the treasures of the Indo-Persian tradition were transferred into this language. As these were mere translations, their contents do not belong to Arabic: only the use of the artistic form of Arabic for this kind of composition was a notable innovation.

The rendering of the *Kalilah wa Dimmah* by ibn al-Muqaqffa' was designed to be read by the educated class who relished it for its moralizing on the conduct of private and public affairs. It was warmly appreciated as a novelty and versified more than once, but the attempts at imitation of the model failed to achieve any considerable measure of success. Thus, pure fiction too, like the fanciful encrustment of history and religion, fell to the lot of the common people who indulged in it for sheer amusement.

The unproductivity of the Arab-Islamic milieu, so far as high-class fiction is concerned, has only to be viewed by the side of unparalleled success in the preservation of the religious texts, the scrupulous eschewing of the subjective element in historical annals, and the evolution of a full-fledged science for establishing the authenticity of a text with reference to the character of the narrator. In short, the learned and the scholarly devoted themselves to checking the rampancy of the imagination of the unlettered rather than giving free reins to their own fancy. Further, the authority of the Shari'ah left no need for any emotional pleading or intellectual canvassing by dramatization of social problems; hence the absence of the story or the novel except for literary and philosophical themes.

Literary Epistle (Risalah) and Rhetorical Maqamah

The extra-ordinary interest in linguistic studies provided a scholar in early Islam with a vast fund of vocabulary and usage as well as a sense of elegance and beauty in expression. He, however, waited for events and occasions in actual life to put his knowledge and skill to use; hence, the

absence of any prose form than the oration and the epistle. The disputations on the merits of the various nationalities and different classes of people brought into vogue for a while the short topical essay. But the natural, forthright style soon started soaring high at the hands of the Persian scribes until it became thoroughly inflated and encumbered.

To this encumbrance the Christian scribes further added the embellishment of *saj'*, and the over-played art degenerated into tiresome gymnastics. There was, however, some expansion in the range of the epistlecum-essay writing, which opened up a welcome outlet for literary skill. Tracts on the rules of good conduct were very popular, some of which on Persian model were meant especially for kings, while others were addressed to all classes. Similarly, there was a plethora of manuals of instruction through which all men of consequence were eager to communicate their wisdom.

But the most important branch conducted merely for the sake of pleasure was "letters" addressed to fellow-scholars and patrons touching upon purely academic and literary problems. Pride and rivalry helped to impart zest to such a pursuit. The style was high-flown and ornate with the obtrusive aim of pedantry. A further development of this tradition of the literary epistle (*al-risalah*) was the *maqamah*, which represents perhaps the first attempt to invent a loose framework of picaresque romance for the display of one's literary knowledge and skill.

The idea must have been suggested by the presence of a real character in the Arabicized Persian society of the time - a witty and somewhat unscrupulous prodigy of letters, devoid of patronage from high-ups and loth to engage himself in any lucrative work, thus compelled to shift for himself by roving from town to town and "begging" by the public display of feats of improvisation on the interesting and instructive situations of life. The emphasis is, no doubt, on the exhibition of linguistic virtuosity but there is throughout a vein of witticism which is sometimes employed for parodying society, manners and peoples.

As this form came to be the dominant one in Arabic prose, a large variety of it depicting incidents and situations concerning particular classes such as the 'ulama' and the lovers, was successfully attempted in every age. It has throughout remained a typically indigenous product, especially suited to the equipment and training of the Arabic scholar as alluded to above.

Development of the Story for Literary Theme

The significance of the *maqamah* lay in the Arabic scholar at last condescending to create out of imagination the framework of a story, however short and undeveloped, with a view to displaying his profuse but pent-up literary skill. For the newly released fancy Abu al-'Ala' al-Ma'rri borrowed the wings of the popular traditions relating to the Prophet's Ascension (*al-mi'raj*) to the heavens. His *Rislat al-Ghufran* is really a *maqamah* cycle under the overall covering of a *risalkah*. The story is no more than a frail show-case to display the author's store of knowledge, just a device to string together a series of expositions of problems and judgments relating to the poetry, literature, and grammar.

As the author was also a philosopher and a critical observer of beliefs and practices, he brought out the witticism characteristic of the maqamah for an audacious burlesque of contemporary state of learning and society, which imparted a unique quality to the work. The state excelled only in pedantry and artificial beauty. Yet the review of the entire field of literature, beliefs, morals, and manners in the course of an imaginary flight remained the high watermark of the traditional Arabic scholarship.

Story for the Philosophical Theme

The philosophical romance of ibn Tufail (d. 580/1184) entitled Hayy Bin Yaqzan is a complete surprise in Arabic literature in more ways than one. Here for the first time we have the plot as the main concern of the author. Sufficient attention is also paid to characterization and setting. The style is sub-ordinated to the theme. It will be recalled that the general body of Muslim philosophers had been confronted with a two-fold problem: the capability of reason to attain to reality unaided by revelation, and the identity of reality notwithstanding the difference in the source and the categories of knowledge imparted by religion.

Soon intuition, the tertius gaudens, achieved a lasting victory over both. On the one hand, it established its claim to be the essence of religion and, on the other, it was recognized as the higher form of philosophy. The importance of the latter development, which was by far the greater victory, has not often been fully appreciated. It was a momentous step indeed to accept intuition as part of a man's natural equipment, cognate with reason, for the "realization" of truth. Anyway, it was for the purpose of explaining all these points together that the philosophers conjured up the vision of a Solitary Man, cut off from all knowledge of religion yet attaining to a vision of God through the proper use and development of his faculties alone.

Historical Writing

The Arabic historian was solely concerned with the preservation of authentic records. He would not digest the facts and attempt at their reconstruction and interpretation of the reader. The merit of a historian like al-Tabri (d. 310/922 - 23) lay only in the extent and variety of his information, his own personality could be discerned only in the indication here and there and a preference for one of the several versions of a particular event. This self-imposed restraint on the part of the historian, like the similar scruples of the adab producer, betokened only high devotion to truth nurtured by the traditions of religious sciences.

As a matter of fact, it proved to be a valuable asset in eliminating, so to say, the middlemen and enabling all posterity to get a purely objective view of the past. Even when the annalistic framework was not strictly adhered to and the method of topical historiography was initiated by al-Mus'udi (d. 345/956 - 57) the style continued to be dominated by reporting. However, this deliberate suppression of the personal element contributed to the lack of any prose for historical writing. Such development had to wait until the beginning of the eighth/14th century when ibn al-Tiqtaqa produced his book al-Fakhri.

Keeping in view the fact of its being an innovation, the success achieved was remarkable. A lucid and fluent yet brilliant style is applied to carefully selected facts combined with appropriate comments. But again, this admirable example was not sufficiently followed up. Rather the main development from which ibn al-Taqtaqa revolted consciously, had already proceeded far on the lines of the transference and application of the epistolary style - grand and verbose, as already noted - to historiography. It was fortunate indeed that this style was carried to palpable absurdity quite early by al-'Utbi (d. 427/1035 - 36).

It was decisively rejected by the Arab taste only to find favourable development in Persian. Court patronage of the historians also brought in the need for flattery and exaggeration, but it must be said in fairness that historian did not absolve himself totally of regard for truth in the manner of poets. On the whole, the style of the official amanuenses and the Court historians of the late 'Abbasid period belongs to the same genre.

The best examples of Arabic historical prose, both in regard to form and content, are the private memoirs of personal experiences of war and peace like the *Kitab al-I'tibar* of 'Uthman ibn Munqidh (d. 584/1188 - 89), and the accounts of travels. In the latter class of works one finds not only observation and effective narration but also the author's own appraisal of personalities and events in the light of history and contemporary society. Generally, the style is simple and natural and even where art is displayed, as in the case of ibn Jubar (d. 614/1217 - 18), it is not over-played at the expense of the content. Al-Ghazālī's *al-Munqidh min al-Dalal* forms a class by itself - an auto-biographical account of mental conflict and spiritual quest written with such simplicity and naturalness as defy all art.

Influence on the West

Looking in retrospect over the entire field of Arabic prose and poetry, the general reader will not fail to be struck particularly with a few features which stand out prominently. First, there is the perfect symmetry, so characteristic of all Muslim art, the unfaltering rhythm, and the regular rhyme which at once give the general impression of order, system, and exquisiteness in the construction of the verse. Secondly, there is the entire scheme of romantic love as embodied in the tradition of the ghazal. It is not fully appreciated, especially among the Muslims who take it as a matter of course, how much the Islamic outlook on woman and sex relationship has to do with the sentimental romantic love.

Love as an art can only flourish in a society where the company of woman is sublimated into a virtue. A further condition for the growth of romanticism is the recognition of certain ethical rules for courtship, a certain idealization of restraint. Such restraint is only symbolic of awe for the independent will of a separate individuality (best exemplified in the economic rights of women in Islam) coupled with a tenderly appreciation - so different from lustful exploitation - of the frailty and delicacy of the feminine constitutional and sentimental make-up.

In the blind fervour of the extremist revolt against the denial of human rights to women in the West, the last basis of all chivalry and romance is much liable to be forgotten. Anyway, it was these two features - the

exquisite form and the romantic content - of the Andalusian poetry which impressed the troubadours of Provence so deeply. Needless to say that lyrical poetry of romantic love had a special development in Spain so as to become unique even in Arabic. In the same way the strophic verse blossomed in Spain as nowhere else. The tradition, however, goes back to the Umayyad ghazal with Islam intervening between it and the frank hedonism of the jahiliyyah.

Turning to prose, one finds Arabic offering, at its best, aphorisms, apologues, popular fables characterized by the spirit of adventure, and picaresque romance (maqamah). Actually, these were the very curiosities which achieved a ready success in medieval Europe through oral transmission and book translation. It was not very appropriate indeed that works like the Arabian Nights, which were meant only for recital in the marketplace, were read in book form in Europe.

This was bound to produce certain revulsion at a later period when they were to be devoid of the finer elements of literary art. Anyhow, "orientalism" - a touch of the fabulous, the wonderful, and the exotic - entered the thought processes of the European writers and poets. Still more important is the percolation of some of the higher devices resting on characteristically Islamic traditions like the mi'raj into the Divina Commedia and the Solitary Man into Robinson Crusoe.

Bibliography

Ibn Khaldun, Muqaddimah; Jurji Zaidan, Tarikh al-Adab al-'Arabiyyah; Ahmad Amin, Fajr al-Islam, Duha al-Islam, and Zuhr al-Islam; Taha Hussain, Hadith al-Arba'ah, Parts One and Two; Zaki Mubarak, al-Mada'ih al-Nabawiyyah, Cairo, 1935; H. A. R. Gibb, "Literature," The Legacy of Islam.

Notes

1. Note the definition by ibn Qutaibah of a born poet as "the one who indicates to you the end of a verse in the very beginning of it, and the qafiyah in the fatihah (opening word) itself." Al-Shi'r w-al-Shu'ara', Cairo, 1367/1947, 1, p. 36.

2. It was perhaps an account of this special knowledge that he was called sha'ir, i.e. the "kenner," who knew better than others. There is, however, another view which traces the word to its Hebrew counter-part meaning "chanting" and "singing." Anyhow, the poet only knew and sang whereas the authority for taking decisions and giving judgments rested with another class known as the hukkam. Fajr al-Islam, p. 56.

3. The schooling of the impulses through hudud Allah (limits of the Sacred Law) pinpoints the difference between the jaahiliyyah and Islam.

4. Consistently with the Arab habit of ascribing long, gradual developments to particular persons, the innovation of the qasidah is said to have originated with Muhallil b. Rabi'ah (c. 500 A.D.), whose very name bears testimony to his contribution. Al-Jumahi (Tabaqat, Cairo, 1952, p. 24) dates it from the time of 'Abd al-Muttalib and Hashim b. 'Abd Manaf.

5. There are touching stories of lovers who would intercede with the hunters to have the gazelles set free because of the resemblance of their eyes to the eyes of the beloved; cf. Raghbat al-'Amil, 7, p. 39.

6. The stock phrase attributed in the Qur'an to the pagans in defence of their ways that "they found their forefathers practising them" faithfully exposes their lack of thought and reasoning.

7. Vide al-Ma'arri, risalat al-Ghufran, ed. Bint al-Shati, p. 246.

8. Al-Jumahi, op. cit., p. 11.

9. Ibid., p. 197; see also p. 217 where the same reason is adduced for the meagreness of poetry in al-Ta'if and 'Uman.

10. Qur'an (26:224) et seq. There is an exception in favour of those who are devoted to righteous belief and good deeds.

11. The example of the Qur'an illustrates the principle of novelty in literary form. In order to achieve the paramount purpose of communication and effect, novelty must always be embedded in familiarity.

12. The verses of ibn al-Zib'ara are much more explicit on the subject of renunciation of the old and devotion to the new ideal, vide al-Jumahi, op. cit., pp. 202 - 03.

13. An excellent example of the change of values in this respect is provided by the *hija'* of al-Najashi which was taken by 'Umar to be a eulogy, vide ibn Qutaibah, op. cit., 1, p. 290.

14. Up until the days of 'Umar, Arabian music was nothing but intonation of voice in the manner of a camel-driver reciting his songs (vide al-Aghani, 8 p. 149, quoted in Fajr al-Islam, p. 120). This accounts most plausibly for the absence of reference in the Qur'an to music and dancing while the symbolization of wine is so common-place.

15. Vide al-Jahiz quoted in Duha al-Islam, 1, p. 15.

16. Ibn Khaldun, Maqaddimah, Chap., 6 (49).

17. Ibn Qutaibah, op. cit., 1, p. 451.

18. In all Islamic literature some of the best wine songs have been produced by those who never tasted it. After all, does an actor actually experience death before he successfully acts the scene on the stage? Even the poets who waxed eloquent on the properties of the saliva safeguarded the chastity of the lady-love by saying at the end that they knew of it just as one knew of the water in the cloud by the flash of lightning.

19. It is only an exuberance of popular fancy which has foisted with *mujun* of Abu Nuwas on the company of Harun al-Rashid. Ibn Khaldun has noted the incongruity of it with the restraint and dignity of the bearing of the great monarch.

20. Any exact parallel is to be observed in our own day: Is it not that wine-drinking, ballroom dancing, and cabaret shows are associated with the superiority of the cultural taste and the intellectual refinement of Western provenance?

21. It is not merely a sentimental reaction but a perfectly reasonable attitude that the liberties taken by Iqbal's "love in the presence of God be denied to one who talks of God from the atheistic viewpoint. A verse of Hafiz ridiculing formalism in religion will be appreciated by the Muslims, who would legitimately resent the same being quoted in the context of an anti-God movement. Also, significant are the words in which al-Mahdi interceded with his father, al-Mansur, on behalf of Muti' b. Iyas. He pleaded that Muti' was only a *fasiq* (libertine) and not a *zindiq*, i.e. not committed to over-throwing the existing order.

22. In our own time Iqbal succeeded eminently where Abu-'Ala' failed miserably. Iqbal's employment of the traditional language of the mystics, which sometimes misleads even great scholars to take him for a mystic, is a device to make his ideas appear beautiful. Such a popular and familiar literary medium is all the more essential when the ideas are novel and unfamiliar.

23. This is the "abuse of time" which is expressly prohibited by the Prophet. Only he would curse the stars who believe him to be a passive object under their blind inexorable influence. Islam, on the other hand, stands for man's active and dominant role in setting the pattern of life through the instrumentality of the process of time as ordained by God; cf. Iqbal, *Asrar-i Khudi*.

24. See the interesting treatise on elegant manners by al-Washsha' (Leiden, 1887).

25. Vide Risalat al-Ghufran, p. 183.

Chapter 51: Arabic Literature, Poetic and Prose Forms

A. Grammar

The intellectual activity of the early Muslims stemmed directly from their devotion of religion. The Arabs had throughout been sensitively proud of their language; contacts with foreigners were regarded by them as derogatory to pure Arabism. However, before Islam any corruption of the dialect was but a social drawback; after Islam, any lapse from the norm inevitably led to distortion of the sacred text with dire consequences both in this as well as in the next world. Curiously enough, it was Islam itself which brought about the commingling of the Arabs with the non-Arabs on a vast and unprecedented scale.

In the very second decade of the Hijrah the Arabs were carried on the crest of a wave of military conquests across the bounds of their homeland to settle down in the neighbouring countries of Iraq, Persia, Syria, and Egypt. At the same time there was a large influx of aliens, mostly prisoners of war, into the principal towns - Mecca and Medina - of Arabia itself. Before long, there appeared for the first time in history a considerable and growing number of neophytes seeking initiation into Arab society with a conscious effort to learn, imbibe, and serve that new religious culture which was only couched in Arabic and had its prototype in Arab milieu.

Naturally enough, the inaptitude of these neophytes in the use of the Arabic tongue excited the laughter of the younger folk in Arab households, it also shocked the elders as it amounted to inadvertent profanity and distortion of the Qur'anic verses.¹ The corruptive effects on the new generation of the Arabs - the townsmen among them - were no less disconcerting; the daily usages marked a sharp decline from the Qur'anic idiom. Thus, there is little doubt that about the middle of the first century of the Hijrah the Muslims were squarely face to face with their foremost literary problem, viz, the need for the preservation of the Qur'an.

The Arabs needed reinforcing their own natural way of speech with a discipline of conscious effort; they were also eager, in keeping with the true spirit of Islam, to pass on to the myriads of non-Arabs, who daily swelled the ranks of the faithful, not only the religion and the practices of Islam but also the language as a key to a first-hand knowledge of its primary source or sources.² Actually, however, only a few of the Arabs concerned themselves with those branches of studies which involved the use of the method of qiyas, i.e. analogy and deduction.³

Such creative intellectual activity was notably flair of the non-Arab inhabitants of Iraq, which province occupied a unique position in the incipient literary life of Islam. It is worthwhile recalling that the province had been the cradle of ancient civilizations and the nursery of cultural currents from the Hellenes, including those relayed from the important academy of Jundi-Shapur; hence, the mental attitudes of its inhabitants bore the stamp of philosophical scientific discipline. Still more remarkable was the spirit motivating the political relationship of these "intellectuals" with their proud and unlettered masters, the Arabs, and their peculiar religious and cultural propensities towards Islam and the Arabic language.

In contrast with Syria and Egypt, it will be seen that the 'Ajmis of Iraq were from the very beginning determined to assert their own individuality, albeit only within the pale of Islam and on the ground of Arabs' own devotion to the Arabic language. Even the Sh'ubiyah movement, the outburst of an outraged sense of superiority of the Persians over the Arabs, involved no resilience from loyalty to the language of the Qur'an. It was a clear parallel to early Shi'ism, which was calculated to work out the political ascendancy of the Persians but only under the supreme and authoritarian over-lordship of the House of the Arabian Prophet.

Basrah and Kufa, the two cantonments of the Arabs, provided ideal conditions for fruitful contact between the Arabs and the non-Arabs. Of particular importance were the proximity of the two towns to the northern Arabian desert, long regarded as the preserve of the linguistic norm, and the market-place of al-Mirbad - on the outskirts of Basrah - was no less a close-by rendezvous of the A'rab (Bedouin Arabs of the desert) and the literati until the former, becoming aware of the demand, themselves came to offer their linguistic materials to the elite of Iraq and western Persia.

According to the classical tradition, it was Abu al-Aswad (Zalim b. 'Amr) of al-Du'ali (or Dili), a poet, warrior, and teacher died (69/688 - 89) at the age of 85), who took the first step to stem the tide of growing laxity and error in the use of the Arabic tongue. He was an active partisan of 'Ali in politics and actually fought against Mu'awiyah at Siffin. It is, therefore, no surprise that he should take pride in claiming that the rudiments of Arabic grammar were confided to him by 'Ali. This assertion can safely be dismissed as only an instance of the too frequent attempt to trace all learning to 'Ali, the "Gateway of the City of Knowledge."

It is also true that Abu al-Aswad himself cannot be credited with having worked out the fundamentals of Arabic grammar as such.⁴ But it is reasonably certain that he did institute something which, to later historians of the development of grammar, appeared to be the genesis of it. Let us examine what it was actually. Until the time with which we are concerned, the Arabic script, originally taken over from the Syriac-Nabataean writing, remained without a system of i'rab, i.e. vowel-marks. Nor was there any established practice as to the i'jam, i.e. diacritical marks, to distinguish letters of similar shape. Of course, there was no urgent need for either so long as the main dependence was on memory and writing was regarded as a mere casual help.⁵

In context of the new demands made by the change in the social pattern, the alert and acute mind of Abu al-Aswad realized the inadequacy of the written consonantal letter to evoke the correct unmarked vowel, which had ceased to come natural as of yore. He, therefore, must have been the first to conceive the idea of introducing some further aid to make the people "know and observe correct speech." It appears that at the first innovation was opened Ziyad b. Abihi, the Governor of Basrah, with whose sons Abu al-Aswad might have discussed it. After some time, however, all conceded that it was absolutely needed and Abu al-Aswad went forward to lay down the following system:

1. the vowel “a,” the pronunciation of which needs a full upward opening (fathah) of the mouth, to be marked with a dot above the letter,
2. the vowel “i,” the pronunciation of which needs a little downward movement (kasrah) of the mouth, to be marked with a dot below the letter,
3. the vowel “u,” the pronunciation of which needs a rounded closing (dammah) of the lips, to be marked with a dot in front of the letter.⁶

This system of dots is to be seen in one of the oldest copies of the Qur’an dated 77/696, now preserved in the National Library at Cairo. The text on parchment is in black, while the vowel dots are in red, in accordance with the usual practice. It has been noted that a similar system of dots was in use in the writing of Syriac, and, though Abu al-Aswad’s contacts with the Syrians are not expressly alluded to, it stands more than probable that having realized the urgency he turned round and took the cue from his compatriots of the Syrian Christian Church.⁷

It is also possible, as some reports make out, that Abu al-Aswad went a step further to propound some broad distinctions in the main parts of a sentence such as the subject and the predicate. On the whole, however, his contribution was merely to focus attention on the usage of vowel endings as the distinctive characteristic of Arabic. Hence, observation of vowel endings was designated al-‘Arabiyyah, i.e. the art of speech in the correct and characteristic Arab way. The use of vowel-endings itself was known as al-i‘rab, i.e. rendering into the proper Arabic way.⁸ The al-‘Arabiyyah was undoubtedly an embryonic form of Arabic grammar.

The emphasis on al-‘Arabiyyah grew in proportion to the need for saving the Qur’an from being consigned to antiquity. So far the method used was mere talaqin, i.e. putting the particulars in the mouth of the student. Only the necessary terms and signs for indicating the different vowels in speech and writing had been devised. As yet there was no ta‘lil or reasoning on the basis of general principles governing the incidence of the i‘rab. But certainly the i‘rab was under intense and searching observation, from which it was not a far step to collecting a number of analogous examples and inducting from them some rules for general guidance.

This was the beginning of the discovery of the logical structure of the language which, in the words of Sarton, was as much a scientific discovery as, for example, the discovery of the anatomical structure of the human body. This scientific discovery, the Nahw proper, reached the proportions of a separate branch of study at Basrah with ‘Abd Allah b. Abi Ishaq al-Hadrami (d. 117/736) and his student, Abu ‘Amr ‘Isa b. ‘Umar al-Thaqafi (d. 149/767). Both the teacher and the student were non-Arab clients (the latter being the client of none other than Khalid b. al-Walid) who relished putting the Arabs to shame on the score of incorrect speech. They had a reputation for boldness in ‘ilal w-al-qiyas, i.e. induction of causes from an array of analogous examples.

Even in the first flush of discovery, they were so confident of the principles arrived at that they did not mind criticizing on their basis the ancient model poets such as al-Nabighah, not to speak of the contemporary al-Farazdaq. When the latter composed a vitriolic satire against his dogmatic critic, ibn Abi Ishaq would only retaliate by pointing out a grammatical

mistake even in the satirical verse.⁹ The student elaborated the method explicitly, as in discovering principles which held well generally and in listing the deviations as *lughat*, i.e. exceptional usages. And it was he who embodied the results in two books said to have been the first on the subject.

It must be noted that *al-lahn*, i.e. incorrect speech, which gave stimulus to the thought of Abu al-Aswad, had by the turn of the first/seventh century assumed alarming proportions. It had percolated to the ranks of the elite of the Court and the administration as well as the circles of the learned such as the traditionists and the jurists. But the deterioration, as far from inducing an attitude of toleration, gave rise to a strong reaction against what was regarded almost as a sin, and there was a determined effort not so much to preserve the purity of the Qur'anic text as to make the ordinary speech conform to the standards of its idiom.¹⁰ It was at this very time that *al-Nahw*, the science of "the proper way of speech of the Arabs" (ibn Jinni), was fully recognized as an independent branch of study and the term *al-nahwi* became widespread in popular parlance.¹¹

The Basrah School reached its perfection in the following age, which produced such giants as al-Khalil and Sibawaihi. Al-Khalil b. Ahmad, a truly versatile genius of Arab descent (al-Furhudi/al-Farahidi, al-Azdi), whose contribution alone would outweigh the achievement of the host of non-Arabs, was born in 100/718 - 19 and died sometime between 170/786 and 175/791. There can be no greater testimony to his powers or originality than the discovery of Arabic prosody without any previous pattern, taking his cue merely from the rhythmic beats of the smith's hammer.

No surprise that after benefiting from the teachings of 'Isa b. 'Umar, he should have been able to elaborate the framework of Arabic grammar, a framework within which *al-i'rab* could be explained and reasoned out. But al-Khalil cared neither for fame nor for material gain; it is said of him that he lived in a state of abject penury while his students made a fortune with the learning imbibed from him. It fell to the lot of his Persian student Sibawaihi,¹² who also had direct contact with 'Isa b. 'Umar, to complete the work of al-Khalil and to arrange and produce his findings in concrete book form.

Sibawaihi (Abu Bishr 'Amr b. 'Uthman b. Qanbar), a native of Shiraz who died at the young age of about 40 years in the last quarter of the second century of the Hijrah, really proved to be another genius for comprehensiveness, if not so much for originality. His *Kitab* has throughout the ages been regarded as the final word on Arabic grammar and has become proverbial for its unique position in the field. Those who followed Sibawaihi right down to the present time could only comment upon, remove obscurities, arrange and rearrange the materials furnished in the "Book" without adding much to it.

It has been a vexed question as to whether the main concepts of Arabic grammar are an indigenous growth or they are traceable to some external pattern. Modern scholars have stumbled upon casual resemblances such as those with the Indian *Praticakhyas*, but they offer no secure ground for any assumption of borrowing. It must be remembered that the Arabic grammar is concerned mainly with the *i'rab*, which is a peculiarity of the Arabic

language and was actually realized and proudly asserted to be so by the early grammarians.

Hence, it is no less misleading to make much of the similarity between the division of a word in “ism,” “fi’l,” and “harf” in Arabic and the analogous categories in Syriac or Greek. Obviously, the Arabic grammarians had to chalk out and proceed on their own lines and, in fact, they have given us a fair idea of how they applied their efforts on the problems, which was peculiarly their own. As hinted earlier, they began by observing the various positions of the words in a sentence and the particular i’rab taken by them in those positions.¹³ These rules went on developing in the direction of reducing further and further the number of exceptions which would not admit of their general application.

What helped the people of Iraq in this undertaking was a flair of ‘ilal and qiyas, which was exhibited in an equal measure in grammatical and literary studies as well as in Fiqh and jurisprudence.¹⁴ This flair certainly bears the impress of Hellenism. Nevertheless, it remains a mere conjecture that the early Muslims took over anything specific from Greek sources in grammar, in the same way as it is a mere wishful thought that Fiqh is indebted to anything specific in the Roman Law.¹⁵

The cornerstone of Arabic grammar is the correlation of the i’rab of the different parts of a sentence based on the theory of an ‘amil, i.e., an efficient cause supposedly resident in one of the parts and governing the whole. The earliest trace of it is perhaps in the Kitab al-‘Awamil of al-Khalil - a work known to us only by its title. But there is no reason to suppose that al-Khalil diverged in any way from the general line pursued thitherto by ‘Isa b. ‘Umar and others. Unless, therefore, this ‘amil theory is proved to have been formulated on a familiar pattern, the indebtedness of Arabic grammarians to any external source will remain highly problematic.

There is, however, yet another development of Arabic grammar which is clearly and directly traceable to Greek influence. The most notable and lasting effect of the assimilation of Greek logic and philosophy in the ‘Abbasid period was a general tendency to remould into logically defined systems almost all the nascent branches of learning, which until then lacked a rigid order. So far as Arabic grammar is concerned, the development took place when a Mu‘tazilite Mutakallim and a nahwi were combined in the person of Abu al-Hassan ‘Ali b. ‘Isa al-Rummani (d. 384/994).

Actually, the process reached its culmination in al-Rummani so as to justify his being credited with that highly conventional logical reasoning which has since formed such a notable feature of Arabic grammar. This new development is amply borne out by a saying that out of the three contemporaries the words of al-Sirafi (Abu Sa‘id al-Hassan b. ‘Abd Allah) were thoroughly understood without a teacher, those of Abu ‘Ali (al-Hassan b. Ahmad) al-Farisi were only partly so, whereas those of al-Rummani were not intelligible at all.¹⁶ Even though Abu ‘Ali al-Farisi, who, according to solve the above testimony, was himself partly affected by the innovation, is reputed to have commented that if Nawh be what was expounded by al-Rummani, then he had nothing to do with it, and vice versa.

Undoubtedly, al-Rummani, did not bring out a new system of grammar, he only applied the methods and the jargon of Aristotelian logic to the adumbration of those nebulous conceptions which, in the simple language of the old tradition as represented by al-Sirafi, were easily comprehended by the average student. There was a similar transformation in Arabic rhetorics, too. Further, it will be noted that by this time the Arabs had acquired some familiarity with Greek grammar, which warranted their indulging in a comparison of its merits with those of Arabic grammar. By the latter was considered to have already possessed a separate entity with a different development.

While the general trend to Basrah was to go ahead with the formulation of general rules, there also developed a reaction against the scant attention paid to the angularities of actual usage, which, however, came to the fore only when Abu Ja'far (Muhammad b. Abi Sarra 'Ali) al-Ru'asiyy took it over as the basis of the rival school of Kufah founded by him in the latter half of the second/eighth century. The Kufans would assiduously collect such instances as violated the general rules of the Basrans and would treat them not as exceptions but as the basis of another general rule opposed to that of the Basrans.

This school achieved a meteoric rise in importance under the favour of the 'Abbasid caliphs. Two of its very influential representatives at the Court were: (a) al-Kisa'iyy (Abu al-Hassan 'Ali b. Hamzah), the Persian student of both al-Khalil and Abu Ja'far al-Ru'asiyy, who came to be regarded as the compeer of Imam Abu Yusuf under Harun al-Rashid, and (b) al-Farra' (Yahya b. Ziyad), the Dailamite, who was appointed tutor to al-Mamun's sons and was designated as Amir al-Mu'minin in the realm of Al-Nuhw.

Ultimately, however, Baghdad proved a veritable crucible for the gradual fusion of the two schools through inter-change. From the end of the third/ninth century onwards there flourished at the metropolis scholars who were free from prejudice for or against any particular town or tribe and were actuated by sheer academic interest and reasonableness.

Just one more development may be noted. Abu 'Ali al-Farisi, who has been mentioned above, had an illustrious student called 'Uthman b. Jinni (d. 296/1002), the son of a Greek slave, regarded as the last of the philosopher-grammarians. But ibn Jinni did not help in clothing the 'amil theory with the armoury of logic; rather he submitted the 'amil theory itself to the scrutiny of reason. The result was a scathing attack on the false notion that one particular word in a sentence governed the whole.

The hint dropped by ibn Jinni was picked up in far distant Spain by "ibn Madda'," the Zahrite Qadi of Cordova under the Muwahhids, who in his al-Radd 'ala al-Nuhat attempted something in grammar akin to al-Ghazālī's Tahafut in philosophy. However, his attack, though not lacking in flashes of brilliance, remained a cry in wilderness as no alternative formulation of Arabic grammar on a basis other than the 'amil theory was ever achieved, far less accepted.

To sum up, the inspiration for Arabic grammar came from religion; the need for it was created by the commingling within Islam of the Arabs and the non-Arabs. The methods of observation and induction yielded the

discovery of the main body of “laws” in the working of language. The only snag was that the laws of language are not so uniform and immutable as the laws of nature. The older school of grammarians at Rasrah suffered from an immature pedantry which was aggravated by the desire of the non-Arabs among them to outdo the Arabs.

At a very early time ‘Isa b. ‘Umar had the temerity to boast in the presence of the Arab philologist, Abu ‘Amr b. al-‘Ala’, that he (‘Isa b. ‘Umar) was a greater master of Arabic than Ma‘add b. ‘Adnan, the progenitor of the Arabs! And both ‘Isa b. ‘Umar and Abu ‘Amr b. al-‘Ala’ exhibited a tendency to prefer such readings of the Qur’an as, in their opinion, were more a consonance with the general rule of grammar.¹⁷ This authoritarianism on the part of the “wisdom of the school seeking to improve upon the facts” (Noldeke) was checked by the rise of the rival school of Kufah. Rather, the latter erred on the other extreme. It is said of al-Kisa’iyy that in his avid search for the unusual and the exceptional he would not pause to test the reliability of his sources.

Nonetheless, a relieving feature of the situation was that dogmatism always felt compelled to bow before actual usage, as typically exemplified in the contest between Sibawaihi and al-Kasa’iyy at the Court of Harun al-Rashid.¹⁸ Ultimately, Baghdad provided the necessary atmosphere for the gradual shedding of prejudices and the engagement of all in a joint effort to erect a common edifice large enough to accommodate the conflicting viewpoints on most, if not all, of the established usage. The final success was vitiated by sporadic attempts at putting possible constructions on actual usage.

This tendency was decried at the very start by ‘Isa b. ‘Umar,¹⁹ but it reappeared prominently later on and is justly parodied by Abu al-‘Ala’ al-Ma‘arri in his *Risalat al-Ghufran*.²⁰ The instruments of Aristotelian logic helped to hammer out the crudities of enunciation and adumbration. Finally, there was an attempt to rebuild the entire system on a simpler basis other than the ‘amil theory, which, however, did not fructify. On the whole, the Arabic grammar remains a magnificent achievement - religious in spirit, linguistic in material, scientific in methods, and logical in form - which has been eminently successful in preserving the Qur’an and keeping its idiom unchanged yet alive throughout the centuries.

B. Lexicography

The preservation of the Qur’an involved the institution of such disciplines as would effectively safeguard not only the authentic rendering of the text but also the warranted understanding of its import against error, corruption, or ignorance overtaking those for whom it was “plain Arabic” at the time. The former purpose was achieved through al-‘Arabiyyah, which later on developed into a full-fledged science under the name of al-Nahw. The next concern was naturally the meaning conveyed by the text. In the beginning, there could have been little difficulty about it in the same way as about the vocalization of the text which was just a matter of natural aptitude.²¹

However, with the lapse of time and the changes in the social pattern, uncertainties began to creep in around words and expressions which had

gradually assumed an air of rarity. Obviously, the way to clearing such doubts and uncertainties was to search for the occurrence of those words and expressions in the speech of the Arabs elsewhere.²² In doing so, care had to be taken that the citations should faithfully reflect the idiom of the time of the Prophet during which the Qur'an was revealed. That is to say, either the citations should belong to the period contemporary with, or immediately antecedent to, the Qur'an or be called from the current usage of those whose social pattern had continued unchanged and who, therefore, could be relied upon to have preserved the idiom from the time uncorrupted and untainted by the extraneous influences.

Consequently, a zealous hunt was afoot to collect and preserve as much of pre-Islamic poetry, proverbs, and orations as could be salvaged from the memories of the people together with the current idiom of the Arab, i.e. the people of the desert impervious to influences from outside. The method of collection was identical with that of the collection of the Hadith.

The end of the first/seventh century witnessed the rise of a band of scholars especially noted for their profundity in the field of al-lughah (Arabic usage) with its ancillary branches of al-sh'ar (poetry), al-akhbar (historical annals), al-ayyam (accounts of tribal wars, and al-ansab (genealogies). The most prominent name among these scholars is that of Abu 'Amar b. al-'Ala (70/689 - 154/770), an Arab nobleman of Basrah and an associate of 'Isa b. 'Umar. His collection of Arabic philology, when piled up, touched the ceiling of his asceticism towards the end of his life. Yet he continued to be the primary source of knowledge for the next generation.

While the process of collecting the vocabulary and the illustrations of its diverse uses was still going on, the genius of al-Khalil, whom we have mentioned before, burst with the idea of arranging and fitting the vocabulary into the orderly scheme of a lexicon. Actually, al-Khalil is known as the author of the first Arabic lexicon called the Kitab al-'Ain, but the authorship is a bit disputed. This much, however, is certain that even if the actual compilation was not exclusively or partially the work of al-Khalil, the idea of a lexicon and the scheme thereof were first conceived by him. Let us now examine what the scheme is like.

Al-Khalil starts with (a) reducing all words to their roots, i.e., the radical letters (al-usul) which form an immutable kernel in contra-distinction to those that are added (al-zawa'id) in the course of derivation and inflexion. Next (b) he classifies the roots according to the number of letters comprised in them: 2, 3, 4, and 5. Each class of words is then arranged in a separate part and even within each class special treatment under distinctive heading is resorted to in the case of words containing one or more of the vowels, double letters, or a hamazah.

The above framework is in line with al-Khalil's attempt at a computation of Arabic vocabulary, which is a further proof of his originality. The quest he pursued on the same structural basis in a mathematical way. By multiplying the 28 letters of the alphabet by 27 (28 minus one, to drop out double letters) he got 756 forms of the bilateral (there being no uni-literals in Arabic). Dividing this number by two, he had 378 combinations irrespective of the order of the two letters. Taking these bi-literal forms as

one unit and adding a third letter to them, he worked out the number of trilateral forms and so on.

It will be observed that the above method yielded the theoretically possible combinations of letters, all of which are not in actual use (musta'mal). Consequently, al-Khalil had to mention each and every possible combination and indicate if any specific forms were unused (muhmal). A further peculiarity, which made reference so difficult and cumbersome, was that in the arrangement of the lexicon he concerned himself merely with combination of letters and mentioned all the forms yielded by a change of order of the letters under one and the same heading. For example, under MY one will find both MY and its reverse (maqlub) YM.

Within the above framework, intrinsically scientific but practically unhandy, the order was according to the opening letter of the alphabet in the words. But the order of the alphabet observed by al-Khalil was not free from novelty; the grouping was according to the part of the mouth, from down the throat right to the lips, which produced sound. This novelty has been aptly noted and the similarity between it and the practice of the Sanskrit lexicographers has aroused a good deal of speculation. There is no doubt that the present day arrangement, based on grouping of words according to the shape of the letters in writing, was the one in common use even at that distant date, though the Arabs were also familiar with the order according to the abjad system, which was originally taken over from the Syriac (and Hebrew) along with the art of writing.²³

The phonetic-physiological system of al-Khalil was neither common at the time nor did it achieve popularity afterwards. But any significance which its similarity to that of Sanskrit might suggest is whittled down by due consideration of the fact that in all probability it developed indigenously out of the practice of the recitation of the Qur'an. With the emphasis on recitation it was but natural the phonetics should receive special attention and that there be a grouping of letters on that basis. Actually, evidence does not want that the linguists did engage themselves in such a study; there were some differences too between the Basrans and the Kufans as to the order of the alphabet on the basis of phonetics.²⁴ Moreover, al-Khalil also paid some regard to the frequency of the letters in use. Otherwise, 'ain would not have come first in order.²⁵

No doubt, the general lexicon of al-Khalil represented an idea much in advance of his time. For the following century or so no one dared imitate, far less improve upon, his scheme. In the meantime, however, much valuable work was done in the form of small tracts comprising words, synonyms, and cognates with their fine shades of meaning grouped around particular subjects. Typical of such subjects are: al-ibil (the camel), al-matar (the rain), al-silah (the weapons), and the like. Similarly, special features of the Arabic usage were also singled out for monographic treatment: (a) al-muthallathat, (b) al-maqsur w-al-mamdud (c) al-itba' w-al-muzawajah, (d) al-ajnas, and (e) al-nawadir.

Some philologists wrote running commentaries (concerned merely with the meaning of selected words and phrases supported with illustrations from

other sources) on the Qur'an and the sayings of the Prophet under such captions as Gharib al-Qur'an, Gharib al-Hadith, Majaz al-Qur'an, Ma'ani al-Qur'an, etc.

1. Al-Asma'i (Abu Sa'id 'Abd al-Malik b. Quraib), an Arab of Basrah, was born in 122/739 or 123/740 and died in about 217/832. He amused Harun al-Rashid with his stock of interesting anecdotes about the life of the A'rab.

2. Abu Zaid (Sa'id b. Aus) al-Ansari was another Arab of the Basrah who reached Baghdad during the time of al-Mehdi and died about 215/830, then over 90 years of age. He was not inhibited by partisanship and eagerly learned from al-Mufaddal and other Kufans. By common agreement, he is regarded as thoroughly trustworthy, though his pedantry is often a source of amusement.

3. Abu 'Ubaidah Ma'mar b. al-Muthanna, a maula, said to have been of Persian Jewish descent, was born in 110/728 at Basrah where he spent most of his life. He was patronized by the Baramikah and was summoned to Baghdad by Harun al-Rashid to read his works to him. While rendering yeoman service to the Arabic philological studies, he collected the mathalib or the vices of the Arab tribes and caused such offence to tribal pride that at his death nobody attended his funeral.

4. Ibn al-A'rabi (Abu 'Abd Allah Muhammad b. Ziyad) was the son of a Sindian slave and the foster-child of the famous Kufan philologist, al-Mufaddal al-Dabbi. His prodigious memory was a storehouse of Arabic philology and folklore. Remarkably enough, he relied on his own independent sources and questioned not without success the authority of al-Asma'i and Abu 'Ubaidah. He died about 231/845.

The special treatises referred to above naturally swelled to a considerable extent the volume of material which lay ready at hand for incorporation in a general lexicon. Another such lexicon was produced, rather dictated mostly from memory, by ibn Duraid (Abu Bakr Muhammad b. al-Hassan, born at Basrah in 223/837 and died 321/933) who enjoyed the patronage of the Mikalids of Fars. Though ibn Duraid claims that his work is much easier for reference than that of Khalil, the fact is that there is little improvement so far as the scheme, particularly the break-up of the vocabulary into structural categories, is concerned.

Even the irksome device which jumbles up all the orders, forward and reverse, of a combination of letters under one and the same heading, continues to be there. Only the phonetic order of the alphabet is discarded. Much of the confusion was caused by the nebulous state in which al-tasrif (etymology) happened to be at that time. There was so far no clarity as to the roots of words, particularly those containing a vowel, a double consonant, or a hamazah. Similarly, lack of clarity as to the distinction between al-usul and al-zawa'id caused the different categories to be mixed up. As a matter of fact, it was this uncertainty which made it expedient for ibn Duraid to insert a miscellany here and there, apart from the nawadir or peculiar usages and expressions listed under appropriate captions at the end.

There is indeed one important point of difference which is indicated by the very name, Jamharat al-Lughah. Ibn Durain included in it only the

familiar and the useful and eschewed the obsolete and the discordant. This was the beginning of a process of subjecting to criticism and sifting out the useful and the dependable from the large mass of material left behind by the early scholars, who were concerned with collecting and recording whatever they came across. At the time when the mistakes were being corrected, an attempt was also made to supply the omissions in the works of the early authors.

These, in short, are the new features noticeable in the lexicographical productions of the fourth/tenth century. Particularly notable in this respect is the Tahdhib, whose author, Abu Mansur Muhammad b. Ahmad al-Azhari (d. 370/980), a student of ibn Duraid, was urged to wanderlust in the desert for the collection of al-lughat. Incidentally, he fell captive into the hands of a Bedouin tribe; this provided him with desired opportunity. Equally important is al-Muhit of al-Sahib b. 'Abbad, who died in 385/995.

The culmination of the critical activity of the fourth/tenth century aiming at authenticity and comprehensiveness, was reached in the Sihah of al-Jauhari, Abu Nasr Isma'il b. Hammad (died about 398/1007), a native of Farab who settled down at Nishapur. The very name Sihah reminds one of the Sihah of al-Bukhari. It has already been hinted at that the method of collecting al-lughat was essentially the same as the one applied to the collection of the traditions, only a higher degree of stringency was observed in the case of the latter than the of the former.

This aptly illustrated by the example of al-Asma'i who is held to be trustworthy in regard to hadith, but he risks conjectures in matters pertaining to the lughat and even embellishes anecdotes for the sake of amusement.²⁶ Anyway, it is worthwhile to note that even the nomenclature of the hadith such as the mutawatir and the ahad was applied to the lughat and the degree of reliability of any particular usage determined accordingly. In the beginning it was not uncommon even to mention the isnadi or the chain of narrators and to discuss the personal character and reputation of the transmitters.²⁷

Thus, a compendium of the Sahih was sought to be arrived at in the field of lughat parallel to a similar, though much more scrupulously worked out, effort in the field of religious tradition.²⁸ It has, however, to be noticed that the Sihah suffered grievously from an unfortunate circumstance: the author was overtaken by a fit of melancholy which rendered him incapable of revising the manuscript. Further, due to the absence of any authentic copy of the text, a good of corruption also set in. All this necessitated a re-examination of the work in glosses and commentaries by later writers.

The work of al-Jauhari was still more remarkable in another way. In it the entire vocabulary was integrated (instead of being split up into structural categories) and arranged in alphabetical order with the first reference to the last letter and a second reference to its combination with the first. This new scheme at once became popular and was highly appreciated as particularly suited to a language in which the endings of the words and a unique importance for the purposes of rhyme (qafiyah and saj'). Apart from the merits of this integrated scheme, the development and standardization of al-

tasrif (etymology) at the hands of al-Mazini (Abu 'Uthman Bakr b. Muhammad, d., 249/863), ibn Jinni, and al-Rummani during the course of the fourth/tenth century removed a good deal of the confusion which marred the works of al-Khalil and ibn Duraid.

We have now reached a time when the Arabic vocabulary was supposed to have been exhaustively collected and the meanings of words established with reasonable certainty. Henceforth, efforts were directed at collecting the material scattered in the previous works either (a) in the form of large comprehensive dictionaries or (b) in concise handy volumes designed for the ordinary student. Naturally, the latter often dispensed with illustrations and citations. The most important works of the former category are:

1. Al-Muhkam by the blind Spanish scholar, ibn Sidah (Abu al-Hassan 'Ali b. Ahmad?, d. 460/1068), was held in great esteem for comprehensiveness and absolute reliability. But perhaps the author did not like innovations; hence, he went back to the earliest model of al-Khalil for its arrangement.

2. Al-'Ubab (incomplete) was composed by Radi al-Din Hassan al-Saghani, born in Lahore in 570/1174. He settled in Baghdad where he dedicated his work to ibn al-'Alqami, the minister of al-Musta'sim, whence he was sent out twice as ambassador of the 'Abbasid Caliph to the court of Iltutmish at Delhi.

3. The Lasan al-'Arab was compiled by ibn Mukarram/ibn Manzur (Jamal al-Din Muhammad), who was born in 690/1291 and died at Cairo in 771/1369. It is expressly based on the works of ibn Duraid, al-Azhari, al-Jauhari, and ibn Sidah.

Of the latter category, the work which achieved a high degree of popularity in the Qamas of Majd al-Din al-Firuzabadi (Muhammad b. Ya'qub) who died in 816/1413. It draws upon al-Muhkam and al-'Ubab.

Yet another work which deserves special mention is the Asas al-Balaghah of the well-known Mu'tazilite al-Zamakhshari (Abu al-Qasim Jar Allah Mahmud b. 'Umar, born 467/1074 and died 538/1143). The author was a native of Khwarizm who spent a long time in Mecca and Baghdad. He realized that the mere recording of meanings was an insufficient guide to the practical use of words. He, therefore, would give the occasions and the contexts in which the words were employed. What is still more remarkable is the arrangement of the Asas, which is in the alphabetical order with reference to the first (and the second and so forth) letter of a word. That is to say, its arrangement is exactly the same as has come into vogue in modern times since the impact of Western literary influences.

It is interesting to note that the early trend towards compiling treatises dealing with the words grouped around particular subjects did not die with the appearance of the general lexicons; it had an uninterrupted development on parallel lines. The greatest work of this kind is al-Mukhassas, the vocabulary is grouped under the subject headings, e.g., the hair, the eye, etc, which are classified into "books" such as that on "human body." Even if the position of al'Muhkam is not wholly unsurpassed, that of al-Mukhassas is definitely so.

Once the framework of a general lexicon was fixed, the running commentaries on the rare and difficult words in the Qur'an and/or the Hadith were also brought under that form.²⁹ Similarly, no time was lost in extending the facility and the benefits of a general dictionary to the other specialized branches such as zoology, botany, biography, geography, bibliography, and finally the encyclopaedias (al-mausu'at). It may be observed in this connection that interest in language and literature, which the scheme of a lexicon was originally designed to sub-serve, seldom disappeared in any of the works, however specialized and limited the scope of their treatment.

It would, for example be really odd to conceive of a zoologist or a geographer who was not familiar with the references in the Qur'an and the hadith or who would be unable to recall poetry, proverbs, and pith sayings concerning animals or towns. This all-pervading interest in humanities is perhaps the most valuable asset of Islamic culture.

In conclusion, it will be recalled that the early philologists were fully conscious of the sanctity of their tasks; they showed themselves to be scrupulous in method and honest in purpose. But the scope of the linguistic studies was bound in the course of time to extend beyond that was strictly relevant to the Qur'an and the Hadith. As the bounds of the sacred faded into those of the profane, the common failings of vanity, mere guess or conjecture or even unguarded reliance on genuine misunderstandings contributed to the interpolation of the spurious.

Also, as these studies came to be held in high esteem and patronized with abundant monetary gifts, the veterans in the field were sometimes tempted to window-dress faked rarities in their shop. But the probe into their personal weaknesses, so characteristic of Islamic religious and literary tradition, and the severe tests subsequently applied to their statements served to a large extent to clear the chaff from the grain. On the same way it is impossible to claim that the entire vocabulary and the usage were exhausted, yet there is no gainsaying the fact that an enormous part of them was actually encompassed.

The charge that the Arabic philologists concerned themselves too exclusively with the idiom of the Qur'an and showed no interest in contemporary deviations from the same, tantamount to questioning their objective or purpose, which has been steadily confirmed throughout the ages. In regard to the scheme and the arrangement of a lexicon, the early pioneers proceeded on the basis of a scientific etymological analysis of the structure of the vocabulary. Practical convenience was achieved later in the superbly original plan of al-Jauhari, which remains the one especially suited to the genius of the language. Even the model which has become so popular in modern time is traceable to al-Zamakhshari.

Bibliography

Notes

1. This is amply borne out by the different versions of what prompted Abu al-Aswad al-Du'ali to turn to grammar.

2. It is noteworthy that Abu al-Aswad al-Du'ali, who showed himself genuinely anxious to help the non-Arabs learn Arabic and Islam, did so in spite of his jealousy of their prosperity and influence. There was not the slightest trace of any tendency among the Arabs to sit Brahman-like over the treasures of religious knowledge.

3. This applies equally to grammar and to al-ra'i in the realm of Fiqh.

4. Encyclopaedia of Islam, "Abu al-Aswad."

5. In the Islamic literary tradition, the written book long continued to serve merely as an aide memoire - a copy of what was preserved in memory and not vice versa.

6. It will be remarked that the other synonyms such as nasb, jarr, and raf' also refer to the same varied movement of the mouth. Closely parallel to the Arabic terms are the Persian equivalents: zir, zabar, and pish.

7. The Syrian Christians of the west had another Greek alphabet (five altogether: Y, E, H, O, A), instead of the dots, were used as vowel marks. At some later date, not exactly ascertained, the Arabs also replaced the dots with letters of their own alphabet albeit in an abbreviated form: ى from ي, ا from ا (somewhat doubtful), and و from و. Obviously, the change must have been necessitated by the use of dots for diacritical marks along with their use for vowel marks. The diacritical marks are said to have been brought into somewhat systematic use at the behest of al-Hajjaj b. Yusuf, the Governor of Iraq, by Nasr b. 'Asim (d. 89/708), who, remarkably enough, is also reckoned as one of the founders of Arabic grammar. For some time the two kinds of dots were distinguished by the different colours of the ink. The replacement of the vowel dots with abbreviations of ا, و, and ي is sometimes ascribed to al-Khalil b. Ahmad, which is supported by the title Kitab al-Naqi w-al-Shakl among his works.

8. Al-Syuti, al-Ashbah w-al-Nazash'ir, Hyderabad, 1359/1940, 1, p. 76.

9. Al-Jumahi, Tabaqat, Dar al-Ma'arif, Cairo, 1952, pp. 16 - 17.

10. J. Fuck, al-'Arabiyyah (Arabic translation), Cairo, 1951, pp. 26, 65, 74.

11. Ibid., p. 30.

12. The reading "Sibuyah" is not supported by comparison with "Niftawaihi," which the latter is in no doubt because of its occurrence in the rhyme of a verse. Vide ibn Khallikan, Wafayat, "Ibrahim b. Muhammad b. 'Arafah."

13. Cf. Fuck, op. cit., pp. 11 - 12.

14. What distinguished the Fiqh of Abu Hanifah was exactly the same: the probing into the "efficient cause" ('illah) governing a number of given instances and then applying the same to unforeseen circumstances. The people of the Hijaz were extremely chary of such reasoning and it is no mere chance that they came to be notorious for their ignorance of grammar. It is remarkable that the opponents of Abu Hanifah, who wanted to run down his school of Fiqh, thought it necessary to make fun of the application of his methods of grammar. Cf., Fuck, op. cit., p. 65.

15. M. Hamidullah, "Influence of the Roman Law on Muslim Law" - a paper read before the All India Oriental Conference, December 1941.

16. Yaqut, Mu'jam al-Udabi, "'Ali b. 'Isa."

17. It must be pointed out that it was merely a choice from among the various current readings; there was no attempt to "correct" the Qur'an in line with usage elsewhere. As pointed out by Wolfensen, it is an entirely wrong and unscientific approach on the part of some Western scholars to judge and criticize the Qur'an on the basis of pre-Islamic poetry. Apart from any religious sentiment, the Qur'an is the oldest and most reliable book. Other sources, though relating to anterior times, are posterior to it in point of actual compilation. Turikh al-Lughat al-Simiyyah, Cairo, 1926, pp. 169 et seq.

18. The reference is to what is known as "al-Mas'alah al-Zunburiyaah." When Sibawaihi challenged al-Kisa'iyy on a point of grammar, the matter had to be refereed for decision to the Arabs. It is alleged that the Arabs were bribed to save the face of the royal

tutor. The incident affected Sibawaihi so deeply that perhaps it caused his death prematurely.

19. Once when al-Kisa'iyy began giving the various grammatically correct readings of a particular phrase, 'Isa b. 'Umar rebuked him saying, "I want the actual way in which it is spoken by the Arabs," Yaqut, op. cit., "'Isa b. 'Umar," last paragraph. This tendency is to be compared with the *hiyat* - permissible tricks for evading the Law - in which some of the legists exhibited their acumen.

20. Al-Ma'arri contrives to bring the grammarians and the poets in the heaven together when the latter protests at the former's purely speculative interpretation of verses, e.g. p. 152 of the *Risalah*, ed. Bing al-Shati, Cairo.

21. In the words of Abu 'Ubaidah introducing his *Majaz al-Qur'an*, "The Qur'an was revealed in clear Arabic language and those who heard it recited by the Prophet had no need of asking for its meaning..."

22. Cf. the saying attributed to ibn 'Abbas, "When you be in doubt about any rare expression of the Qur'an, seek it in poetry." Al-Suyuti, al-Muzhir, ed. Muhammad Ahmad Jad al-Maula and others, Cairo, 2, p. 302. It was in consideration of this that linguistic studies were regarded an obligation on a par with the obligation of prayer; cf. the verses (*ibid.*). Ibn al-Qatta' (al-Af'al, Hyderabad, p. 3) went so far as to declare that anyone who decries the poetry of the Arabs is a sinner, and the one who runs down their language is an infidel (*kafir*).

23. It was in that original source that numerical values were assigned to the letters in that order, which is still adhered to in Arabic and other Islamic languages for purposes of chronograms. The assertion by later Arab philologists that *abjad*, *hawwaz*, etc., were the names of the inventors of the art of writing (al-Suyuti, op. cit., 2, p., 342) should be taken merely as a recollection of the old borrowing.

24. In *Duraid*, *Jamharat al-Lughah*, Hyderabad, cf. the Preface; cf. also al-Suyuti, op. cit., 1, p. 85.

25. Al-Suyuti, op. cit., 1, p. 90.

26. Cf. Ahamd Amin, *Duha al-Islam*, Cairo, 1952, 2, p. 301. Abu 'Ubaidah once ridiculed al-Asma'i's extreme cautiousness in the interpretation of the Qur'an by asking him whether he was sure of the meaning of *al-khubz* (bread). Cf. Yaqut, op. cit., "Ma'mar b. al-Muthana."

27. Al-Suyuti, op. cit., 1, pp. 118 et seq.

28. Just because the sciences of al-Hadith and al-lughah were recognized as twins, the highest academic title for the learned in either was the same, *al-hafiz*. *Ibid.*, 2, p. 312.

29. Cf. *Kashf al-Zunun* 2, pp. 1204 - 06.

Chapter 52: Arabic Literature: Theories of Literary Criticism

In this account of the Arab contribution to the theories of literary criticism, the term “Arab” is used in a wide sense to include all the Arabic-speaking peoples, and the writers who used Arabic as their cultural medium, regardless of their racial origins.

Literary criticism is also broadly used to cover the whole field of literary appreciation, analysis, judgment, and comparison on the practical as well as the theoretical side. In this broad sense, *Balaghah* - which concerns itself with the study of the figures of speech and the stylistic aspects of literature in general - may be included under literary criticism, at least of the golden era of the early centuries of Hijrah, although, generally speaking the relation between the two is a matter of controversy.

The period covered by our treatment is likewise a fairly long one. It extends from the first/seventh century to the present time, and it corresponds to the Islamic era in the history of Arabs. For, although the Arabs achieved a high measure of perfection in their poetry two centuries before Islam, they did not reach the mature stage of theorizing about literature and its excellence until their minds were stirred and stimulated by the call of the new religion that arose in their midst. The fact that the miraculous sign of the religion of Islam came in the form of a “Clear Arabic Book” was destined to play an important role in Arabic language and literature, and consequently in the enrichment of Arabic literary criticism.

From early times, the Arabs were noted for their literary excellence. Poetry and oratory were the chosen forms of their artistic expression. As early as the second half of the sixth century A.D. when Arabic poetry was in its flowering period, some rudimentary forms of practical criticism could be observed. These were preserved by narrators, and later recorded by the early authors of the general studies of the Arabic language and literature. Some time before Islam there grew a number of marketplaces in the Hijaz where people of different tribes used to assemble for trade as well as for literary contests.

Names of recognized arbiters in those contests, such as that of al-Nabighah al-Thubyani, and their judgments and criticisms were handed down to posterity by the *rawis* (transmitters). Naturally, very little explanation or justification was offered for such judgments, and very often one verse or one poem would be given as a ground for a high praise of a poet or for a comparison between two contestants in the marketplace. Some of the Prophet’s Companions were known for their appreciation and sound judgment of pre-Islamic poetry. The Second Caliph ‘Umar, for instance, was reported to hold that al-Nabighah was the greatest of the Jahiliyyah poets, and when he was asked the reason for this pronouncement, he answered, “Al-Nabighah never used redundant words, always avoided the uncouth in poetry, and never praised a person except for true merit.

By the end of the first/seventh century Arabic culture had spread outside Arabia in various directions with the spread of Islam. The mind of the new Muslim community was getting ready for a general intellectual awakening. The first to reap the benefit of those efforts were the religious fields on one

side and the linguistic and literary on the other. Some scholars busied themselves with the explanation of the Qur'an and the understanding of its challenge of miraculous literary excellence. Others concentrated on tracing pure linguistic usages of the Arabic language and standardizing its grammar and syntax. Some directed their efforts to collecting pre-Islamic poetry and preserving it against loss.

The stage was now set for the beginning of a golden era in authorship which lasted several centuries. The critical problems raised by the Arab authors during this period can be summed up under the following main headings:

1. Literary aspect of the Qur'anic i'jaz (eloquence of discourse), and the extent to which literary could aid in discovering the secrets of that i'jaz.
2. Unique and sometimes obscure usages of the Qur'anic style.
3. Authenticity of literary texts transmitted by the rawas from pre-Islamic and early Islamic times.
4. Classification of the Arab poets, both Islamic and pre-Islamic.
5. Merits and demerits of the ancients and moderns in Arabic literature, and controversies between traditionalists and innovators.
6. Claims of meaning and expression to literary excellence.
7. Originality and imitation, and the phenomenon of plagiarism.
8. Nature of speech and articulation.
9. Meaning and essence of literary excellence, in structure, signification, effectiveness, and formal beauty.
10. Definition of the figures of speech.
11. Standards for the comparison between rival poets.
12. Norms of excellence in the chief poetical arts, such as panegyric, satire, and elegy.
13. Linguistic aspects of literary art.

These various problems of literary criticism were treated sometimes separately in a specialized fashion, and sometimes together in manuals or textbooks. The stylistic aspects in particular received a large share of the Arab authors' attention, and the researches around them grew until they formed a separate critical branch under the name of Balaghah. This was mainly the outcome of the Muslims pre-occupation with problems of the Qur'anic exegesis and i'jaz. Greek writings on rhetorics which were translated into Arabic as early as the third/ninth century also contributed to the growth of the science of Balaghah. In fact, that science dominated the Arabic critical field all through the later centuries of Islam from the seventh/13th to the 12th/18th.

The above enumeration of the different aspects of Arabic literary criticism will indicate the immensity of its wealth, and the difficulty of separating the Arab contribution in this field from their contribution to the development of Arabic language and literature in general. Many a general book on literature, such as the Kitab al-Aghani (Book of Songs) by Abu al-Faraj, would also claim a place among the books of literary criticism. The same can be said by the unique excellence of the Qur'an.

But the following survey of the main features of Arabic literary criticism we shall limit ourselves to singling out some of its outstanding landmarks and making a brief halt at each of them.

1. On the early grammarians, philologists, and literary critics of the first stage in Arabic authorship was ibn Sallam (d. 231/845). His book *Tabaqat al-Shu'ara'* is representative of the critical attainments of his period. Criticism, he maintains, needs long training and experience, and a critic must be an expert on his subject and well versed in the practice of his art. In other words, taste alone does not meet the requirements of criticism, and must be supplemented by experience and long study. He also adds that poetry, like the sciences and other arts, needs its own special technique and culture. He was aware of the established truth that abundance of practical study is worth more than all academic knowledge.

The second point stressed by ibn Sallam in his book is the importance of verifying the poetical texts and of ascertaining their origin. This is the first step in textual criticism and must be taken as its foundation. He directed a violent attack on the manner in which some Arab chroniclers accepted and narrated ancient poetry, and, therefore, questioned the authenticity of many of their texts.

The other important point in ibn Sallam's book is the division of poets into classes. With regard to time, poets were either Islamic or pre-Islamic. He tried to classify the poets of either era according to the abundance and excellence of their poetry. In his classification he also took into consideration the place of origin.

Although ibn Sallam failed to support judgments he passed on poets and poetry by analyzing the texts or describing the qualities of each particular poet, yet it must be admitted that Arabic criticism was taken by him a step further, especially as regards questions of verification and classification of poets. What we miss in his book, however, is criticism in the sense of a discerning study and a methodical approach. The first attempts at methods are not to be found earlier than the fourth/tenth century.

Al-Jahiz (d. 255/869), who was one of the leading Mu'tazilites and writers of the third/ninth century, tried in his book *al-Bayan w-al-Tabyin* to give a picture of criticism in pre-Islamic times and the first/seventh century. The criticism of that period, he maintained, was elementary, but, to a marked degree, sound and convincing, as it emanated from genuine practical literary taste. The critics of that period, according to him, managed to discover a number of defects in poetical craftsmanship and to give valuable practical advice to orators and poets.

Al-Jahiz's book was an echo of the intellectual life of the Arabs of the third/ninth century. At that time the mosques of Kufah and Basrah were not only places for worship and administration of justice, but also schools for the teaching of language, grammar, Hadith, and jurisprudence, as well as platforms for narrators to relate to the assembled audiences the story of the Prophet's life and conquests. Leaders of theological schools and religious divisions used to go there for dialectical discussions, and a large number of people attended them in quest of knowledge.

Anyone who spoke in the mosque had to possess the ability to express himself clearly, to attract and persuade the audience. Thus, a new kind of study came into being to show the qualities an orator needed, and to point out the defects of different speeches. Observations on effective and defective public speaking contained in al-Jahiz's book can be grouped under the following headings:

(1) Correctness of pronunciation and defects caused by deformities of the vocal organs.

(2) Proper and improper employment of language and harmonious and disharmonious use of words.

(3) Syntax and the relations between words and their meanings, clarity, conciseness, suitability of expression to different occasions and audiences, and of speech to its intended objective.

(4) The appearance of the orators and the agreeableness of their gestures and mannerisms.

Another third/ninth century literary celebrity was the writer ibn Qutaibah (d. 276/889), and the author of many books on literature and Qur'anic usages. In one of his books, *al-Shi'r w-al-Shu'ara'*, he urged people to form independent judgments and use their own power of appreciation. He attacked the philosophers' approach to criticism and their use of logical method in the appreciation and analysis of literary texts. One of the critical problems he raised was that of the division of poets into those who deliberate upon, revise, and perfect their poetical works, and those who depend on the spontaneity and easy flow of their poetic inspiration.

He also opposed the tendency always to give preference to the ancients just because they were ancients. Literary talent, he argued, was not confined to any particular period. A modern poet might easily surpass an ancient in literary creativeness and workmanship.

The contribution of the poet Prince 'Abd Allah ibn al-Mu'tazz (d. 296/908) to the development of Arabic criticism and his influence on it were of a different character. He made a study of *badi'* which was considered in his days an innovation in the poetical art, and set out to prove that it was not a new creation at all. His book *al-Badi'* was the first attempt at a systematic treatment of the figures of speech, which he divided into three main categories: (1) the metaphor which is the pillar-stone of poetry, (2) artifices connected with the form only and not with the essence of poetry, such as assonance (*tajnis*) and anti-thesis (*mutabaqah*), and (3) the dialectical style which takes the form of a logical argument (*al-mabhath al-kalami*).

By quoting copious examples from the Qur'an, the Hadith, the speeches of the Prophet's Companions, and the language of the Bedouins, ibn al-Mu'tazz tried to show that the use of the figures of speech was inherent in the nature of poetry, and that the Arabs practised the art long before the time of Bashshar, Muslim ibn al-Walid, and Abu Nuwas. These modern poets of the 'Abbasid period did not invent the art but simply extended its use until it was thought a new creation. It is an open question whether ibn al-Mu'tazz was influenced, in his *Badi'*, by Aristotle's writing, especially the *Rhetorics* translated into Arabic during the third/ninth centuries.

But the treatment of ibn al-Mu‘tazz has the unmistakable stamp of originality, and the subject seems to have begun to interest Arab critics in the second/eighth century as an Arabic literary phenomenon. The influence, if any, might be sought in the prominence given to metaphor and in the attempt at definition and division of literary artifices.

But the real disciple of the philosophical sciences and the author who manifested Aristotle’s influence very clearly was Qudamah ibn Ja‘far (d. 337/948). His book *Naqd al-Shi‘r* is perhaps the first Arabic book to carry in its title the word *naqd* which is the Arabic equivalent of criticism. It is conceived and planned in the Aristotelian fashion of logical divisions and definitions. The author begins by defining poetry as regular speech with metres, rhymes, and meanings, proceeds to explain and justify this definition on logical grounds, and then adds words as the fourth element constituting poetry.

Out of the relations between these four simple elements he creates four complex ones, which evolve out of the harmony between them. He points out those earlier Arab authors have neglected the critical side of the studies of the poetical art, and directed their energies to the less important aspects, namely, prosody and linguistic considerations. His, then, was an attempt to create a real science of criticism and set the norms of excellence for the principal categories of Arabic poetry.

2. Arab contribution to literary criticism assumes clearer and mature forms in the fourth/tenth century. On the specialized side we meet with al-Baqillani (d. 403/1012), who gives a scholarly account of the Qur’anic i‘jaz, al-Amidi (d. 371/981), who leaves us the best classical Arabic comparison between two great poets, representatives of two schools of poetical art, and al-Qadi al-Jurjani (d. 366/976) the writer of the earliest critical treatise on a great Arabic figure in the literary history of the Arabs. On the general side, at least two contributions must be mentioned here. The first is that of Abu al-Faraj al-Isfahani (d. 356/956), the writer of *Kitab al-Aghani* (The Book of Songs), and a unique book of its kind in the literatures of the world. And the second is that of Abu Hilal al-‘Askari (d. 365/1004), who attempted to give a complete systematic manual of Arabic rhetorical and critical principles as they were known at the time.

Now, to take the general contributions first. The ‘Book of Songs is a literary encyclopedia, in 20 volumes, dealing essentially with lyrical poetry which was set to music and singing by the musicians and singers of the early centuries of Islam. But around this theme the author collected a large amount of critical and biographical information of a great number of Arab poets. The critical aspect of al-Aghani has received the attention of modern academic research. The wealth of narratives and biographical data contained in the book has been a boon to modern Arabic play and story writers.

Al-‘Askari made the two arts of poetry and prose the subject-matter of his treatment and tried to systemize and enlarge upon the earlier general attempts of al-Jahiz, ibn Mu‘tazz, and Qudamah. The two Arabic rhetorical conceptions of *fasahah* and *balaghah* received at his hands satisfactory definitions, the first being connected with elegance and purity of style, and the second with communicating and conveying the desired meaning in a

convincing and effective manner. Long chapters on distinguishing the good from the bad in speech, on the nature of literary art, and on the technique of composition and good description, with copious examples of excellent poetry and prose, occupy about half the book. The rest is an enumeration and elucidation of literary artifices, the number of which al-'Askari raised to 35, which is more than double the number given earlier by ibn al-Mu'tazz.

Al-Jurjani's treatise on i'jaz takes its place among Arabic critical books on account of its attempt at applying the critical conceptions to reveal some of the secrets of the Qur'anic literary excellence. In doing this the author subjected some of the highly esteemed Arabic poems to severe test of criticism to show the fallibility of human products. The Qur'anic i'jaz, he maintained, was something more than and above that which critical standards could explain, something that could be felt more than known by the expert and cultured reader or listener. This theory of i'jaz, peculiar to Muslim culture, we meet again in a different setting when we come to 'Abd al-Qahir al-Jurjani.

The two treatises which exemplify Arabic criticism proper in its methodical form are those of al-Amidi and al-Qadi, Al-Jurhani referred to earlier. Al-Amidi's Muwazanah (Comparison) between Abu Tammam and his disciple and kinsman al-Buhturi is the first systematic treatment of its kind in Arabic criticism. The author collects the common meanings between the two poets and, on the basis of a rigid comparison between each pair of words of similar meanings, decides which is more poetical in that particular context. He takes account of the supporters of each poet, reproduces the reasons given by them for their stand, and brings into relief the faults and plagiarisms of each of the two great poets.

Although the subject of al-Amidi's study is a particular case of comparison, and the features it concentrates on are the artistic and poetic ones only, it claims a high value because of its success in going beyond the particular comparison to a more general comparative study. It adopts the method of adducing comparable examples from the poetry of the forerunners of the two poets, thus enlarging its scope and claiming for it a larger share of critical accuracy. It exhibits the traditional literary models and reveals its author's wide knowledge of Arabic poetry and his cultivated analytical literary taste. It also gives one of the best practical accounts of the phenomenon of plagiarism, which greatly occupies the attention of Arabic critics, permeates a good deal of their comparative studies, and to some extent, colours their judgments of literary values.

Another valuable contribution in the fourth/tenth century to methodical criticism is the "Arbitration" (Wasatah) of al-Adi al-Jurjani between al-Mutanabbi, the famous Arab poet of the eastern Arab world of Islam, and his antagonists. Al-Mutanabbi, by his arrogant personality, wide ambition, and forceful poetry, created adversaries as well as staunch supporters wherever he went. Many grammarians, linguists, critics, and rival poets, shared in finding faults with his poetry and revealing plagiarisms, which, they claimed, he committed against previous masters of Arabic poetry, while others hailed him as the greatest Arab poet that ever lived.

Many treatises were written about him. The situation called for a sympathetic arbiter, and al-Jurjani tried to play the role. His introduction to *Wasatah* contains a good deal of theorizing about literature. An example of this is his interesting, and almost modern, analysis of poetical ability into four component factors: Natural aptitude, intelligence, acquaintance with and memorization of past models, and practical training. These, he maintained, were factors of a general nature, applicable to all humanity, and not confined to a certain age or generation. Another example is the discussion of the influence of environment on poetry, with illustrative examples from the poetry of Bedouins and city dwellers.

All the different aspects of al-Mutanabbi's poetry, viz, his philosophizing tendency to complication, occasional leaning on previous poets, the system of building up his poem and the use of *badi'*, all received a masterly analysis at the hands of al-Jurjani. The book succeeds in giving a general picture of literary criticism in that period. It abounds in opinions of critical scholars and recalls many famous comparisons held between poets, both post and contemporary. In short, the *Wasatah* of al-Jurjani along with the *Muwazanah* of al-Amidi represents the peak of practical Arabic criticism and illustrates the Arabs' mature efforts in that field of literary study.

3. The claims of the Arab contribution of the theories of literary criticism is still to be reached in the fifth/11th century at the hands of 'Abd al-Qahir al-Jurjani (d. 471/1078), the author of the two well-known critical books: *Dala'il al-I'jaz* and *Asrar al-Balaghah*. The first book, although primarily concerned with explaining the secrets and signs of the Qur'anic *i'jaz*, faces the wider issue of literary excellence in general and reaches a fundamental theory of structure, while the second searches deep into literary images and discovers, in the form of a psycho-literary theory, what the author takes to be the real secret of eloquence.

Each of the two volumes advances a thesis, explains it, discusses its applications indifferent rhetorical species, and answers any adverse criticism which it might arouse. They survey the field of Arabic literary criticism in the author's time, point out the lack of true scientific thinking, and the pre-occupation of authors with the non-essentials in literary art, and try to lay the foundations for a new science which would satisfy both the objective and the subjective aspects of literary appreciation. A modern reader of the two books feels inclined to presume that 'Abd al-Qahir thought of literary composition in terms of its two-fold division of structure and beauty.

But it is also possible that when the author wrote his first book he was mainly occupied with and guided by the thesis that eloquence is a product of correct structure and signification. At a later stage, and perhaps owing to other cultural influences and maturation of thought, he found that an important aspect of literary art, namely, its impact on the reader or the listener, still called for a separate and fuller treatment. The starting point in his line of thinking in *al-Dala'il* was the consideration of the place of words and meanings in the art of expression. Some of the ancients, e.g. al-Jahiz, had considered eloquence to be mainly dependent on the quality of the verbal elements, that is, the words.

But, argued ‘Abd al-Qahir, words in themselves do not make language. They do so only when organized in a system of construction according to the requirements of the meaning. The important element in literary composition, then, is structure, and the essence of structure of meaning. Once meanings are defined in the intellect in their proper order, their verbal expressions follow faithfully in a determined fashion. A literary composition achieves its end if it is properly suitably constructed. It becomes vague, obscure, complicated, and generally defective when the verbal element does not harmonize with the meanings, or when the meanings themselves are not clear and coherent in the mind of the speaker or the writer.

Hence, it follows that our main concern in rhetoric should be with techniques of structure, such as junction and disjunction, mention and omission, definitiveness and in-definitiveness, etc. Our chief occupation here should be the study of the characteristics of meanings in construction, which is a combination of language and grammar. This new technique was ably and effectively applied by ‘Abd al-Qahir to the study of the Qur’anic composition, and consequently to the analysis and appreciation of specimens of the highest literary models, and it yielded a complete system which later authors turned into a definite rhetorical branch, namely, the science of meanings (ma‘ani).

In this analysis of the Dala’il, ‘Abd al-Qahir found himself repeatedly resorting to the process of introspection, and suggesting that the best way to discover the secret of literary excellence is to look inwardly into oneself and find out what impressions, satisfactions, emotions, and excitements the whole composition leaves on one’s soul. It appears as if this aspect of literary art directed ‘Abd al-Qahir, in his second book *Asrar al-Balaghah*, to go deeper into the aesthetic side of literature and find out the secrets behind the felling of enjoyment produced by beautiful literary works. Thus, the field of research was transferred to the laws of human thought.

What goes on in our minds and souls when we hear a beautiful literary passage? Why do such artifices as alliteration and assonance please us? And, why do such phenomena as superfluity and obscurity of expression displease us? What is the secret behind the aesthetic effect of a good metaphor or a cleverly conceived compound simile? Which is more appealing to our taste - the spontaneous and easy flowing poetry of al-Buhturi or the deep and meditative poetry of Abu Tammam? And why? If we can refer such questions to some inherent characteristics in our perceptions and conceptions, in our cognition and imagination, we can be assured of a solid foundation for a study of literary appreciation.

In this part of his inquiry ‘Abd al-Qahir shifted the emphasis from constructing the meaning to communicating it in an effective and pleasing manner. The new domain of his study becomes the variety of ways and means for expressing the meaning in an artistic fashion. In this he showed himself to be clearly aware of the fact that literature is part of a wider field, namely, art. Occasionally, in his analysis and argumentation he would appeal to other fine arts such as painting and sculpture. His approach in this second inquiry gave later authors the basis for creating the two separate

rhetorical sciences, the science of exposition (bayan) and that of embellishment (badi').

Put together, the results of his two inquiries could be summarized as follows:

(a) Excellence in literature should be judged from the quality of the structure of the meaning expressed and its pleasing effect on the mind and soul of the reader (or listener) rather than from its verbal aspects.

(b) The beauty of metaphors lies in the fact that they give to style novelty, vigour, and movement, and that they bring out the hidden shades into a perceptual relief.

(c) Composite comparisons by similitude please the human understanding for a variety of reasons: all abstract to the concrete, and from what is known by reflection to what is known intuitively or through sense-perception; man naturally enjoys seeing different things unified by links of similarities and the enjoyment is enhanced when the discovery is reached after a reasonable amount of intellectual activity - if the intellectual activity involved is too little or too exacting, the enjoyment is diminished or marred.

The functions of the intellect are thinking, reflection, analogy, and inference, and all these are exercised and perceiving relations between different things; the rhetorical figures are the embodiments of all these considerations.

In assessing the value and place of 'Abd al-Qahir's contribution to the theories of Arabic criticism, we must bear in mind two considerations: the first is that certain Arab scholars of the flourishing period of the third/ninth and fourth/tenth centuries did anticipate 'Abd al-Qahir in some aspects of his theory. Al-Jahiz, for example, discussed at length the art of oratory from the point of view of its relation to the audience and expressed, though briefly, the idea that good speech affects the heart in a variety of ways. Al-Qadi, al-Jurjani also showed his interest in the psychology of literature and, as mentioned earlier, analysed in a psychological fashion the poetical ability into natural and acquired elements.

The second consideration which has been explored by modern research is that 'Abd al-Qahir must have been acquainted with the Arabic versions of Aristotle's *Poetica* and *Rhetoric* where the First Master probes the affective side of literature both in his treatment of tragedy and in his exposition of the art of metaphor. These various probable anticipations, however, did not diminish the claim of our later Arab author to originality. It is to his lasting credit that in the sphere of a literary study he tried to harmonize the rigour of scientific thinking with the spontaneity of literary taste, and succeeded in this to a remarkable degree.

4. We do not come across another great figure in the study of rhetoric during the fifth, sixth, and seventh centuries A.H., like 'Abd al-Qahir, nor even a vigorous follower of the founder of the science to develop further his ideas and widen the scope of their application, yet during this period much was added to the wealth of Arab contribution to literary criticism, mostly in general comprehensive surveys. One of the great minds of that period is ibn Rashiq al-Qairawani (d. 436/1044), the author of a standard book on the art of poetry entitled *al-'Umdah fi Mahasin al-Shi'r wa Adabih*. It is one of the

fullest treatments of the technicalities of Arabic poetry and its principal kinds.

Another fifth/11th century critic is ibn Sinan al-Khafaji al-Halabi (d. 466/1073), the author of *Sirr al-Fasahah*. Ibn Sinan's chief contribution is in the domain of linguistic criticism where he deals with the sounds of the Arabic language, their classifications, and their characteristics. Al-Zamakhshari of Khwarizm (d. 538/1144), the Qur'anic commentator, deserves a special mention here because of his consistent application of the rhetorical approach to the explanation and interpretation of the Qur'an. His book *al-Kashshaf* claims a high place among the Qur'anic commentaries.

He is also the compiler of *Asas al-Balaghah*, an Arabic dictionary, which is unique in its attention to original and metaphorical usages of the Arabic language. A later author and critic, Dia' al-Din ibn al-Ayhit (d. 637/1239), left us a most valuable and interesting book on the two arts, of the writer and of the poet, entitled *al-Mathal al-Sa'ir*. He dealt with the literary art in two sections: one on verbal expression and the other on meaning, and managed to include under these two headings all the artifices and figures of speech which previous authors since the beginning the third/ninth century had been exploring, defining and illustrating.

He also restated the problems of word and meaning, plagiarism, and norms of comparison in a masterly manner, exhibiting searching, analytical power and independence of thought. Moreover, he invented a practical method for the training of the undeveloped literary talent, which relied on the two factors: the natural aptitude and the nourishing of the ability on classical models. The method is explained in detail, and illustrated from the history of literature as well as from the personal experience and literary works of the author. Ibn al-Athir was so convinced of the originality and applicability of his method that he claimed for himself the title of *mujtahid* of Imam in the same way as the founders of Muslim schools of jurisprudence, Malik and al-Shafi'i, for example, were regarded by posterity.

We may end this series of the great minds with Yahya ibn Hamzah al-'Alawi (d. 729/1328), one of the Imams of Yemen and the author of *al-Tiraz al-Mutadammin li Asrar al-Balaghah wa 'Ulum Haqa'iq al-I'jaz*. The author criticizes books on the subject of literary criticism for being too detailed and thus tedious, or else too brief and consequently insufficient. He acclaims 'Abd al-Qahir as the founder of the science but confesses that he knew of his two books only indirectly through references to them in the writings of other scholars. He mentions some of the authors with whose books he was acquainted, including ibn al-Athir.

The motive for writing his book, he indicates, was to help his students understand al-Zamakhshari's approach to the Qur'anic exegesis and *i'jaz*. According to al-'Alawi, the Arabic literary sciences are four: the science of language which deals with the significance of separate words, the science of grammar which deals with words in composition and predication, the science of syntax which deals with the morphology of single words and their conformity to regular patterns in the Arabic language, and lastly, the combination of the two branches of *Fasahah* and *Balaghah* which are called

ma'ani and bayan respectively, and which are the highest of the literary sciences.

After a long introduction, the book proceeds to deal theoretically with the cardinal questions in the rhetorical sciences, such as truth and metaphor, kinds of truth, kinds of significance, divisions of metaphor, linguistic sounds, single words and compound words and their characteristics, and requirements and examples of excellence in the various literary artifices.

But here we seem to have reached a parting of the ways between rhetoric and criticism. The separation is supposed to have been started by Abu Ya'qub al-Sakkaki al-Khwarizmi (d. 626/1228), the author of Miftah al-'Ulum. He is credited with the delineation of the boundaries of literary sciences in the manner referred to above which al-'Alawi must have followed in al-Tiraz. In the third division of these sciences, al-Sakkaki puts 'ilm al-ma'ani and 'ilm al-bayan conjointly, the first dealing with the characteristics of speech composition by virtue of which they conform to the requirements of the occasion, and the second with the different ways of expressing the meaning to complete the desired conformity.

By this division al-Sakkaki seems to have carried a logical conclusion the distinction which 'Abd al-Qahir indicated between questions of speech structure and composition and those of signification and effectiveness. To this dual division, al-Sakkaki appended a small section on the special aids to speech beautification, which later became the domain of a third separate science, namely, badi'. This process of narrowing the critical field to Balaghah and of demarcating its sciences was completed and standardized a century later by al-Khatib al-Qazwini (d. 739/1338) who condensed al-Sakkaki's Miftah into a textbook called Matn al-Talkhis.

Chapter 53: Persian Literature

A. Persian Literature of Early Times

The earliest remnant of the Aryan languages of Iran which antiquity has bequeathed to us is the language of the Avesta, the sacred book of the Zoroastrian religion.

For About 900 years the people of Iran had no script in which they could write the Avesta. So they continued to learn it by heart and thus communicate it from generation to generation right from the seventh century B.C. to the third century A.D.

A special script was at last invented for this book in the third century A.D. The Avesta written in this particular script has been known as the Zend Avesta. At times it has been just mentioned as the Zend. The French scholar Anquetil du Perron who was the first to have studied it in India at the end of the 12th/18th century, introduced it to the West. For a considerable time it continued to be known as the Zend language in Europe. At present, however, the more accurate term of “Avestic language” is in vogue. The script in which the Avesta was recorded should be known as the “Zend script.”

Much as been speculated on the origin and times of Zoroaster, and different theories have been advanced in this respect from the earliest times. What appears to be most authentic at present, however, is that Zoroaster preached his religion between 660 and 583 B.C. in the north-eastern zone of the Iranian plateau in Central Asia. It is plausible that he sprang from the Median stock, lived in the north-west of the present day Iran, and from there he travelled east to Central Asia. Of the extant languages and dialects of the Iranian plateau Pashto or Pakhto has the closest affinity with the Avestic language.

This lends support to the view that the Avestic language was spoken in the north-eastern regions of the Iranian plateau in the seventh century B.C. The Avesta is a massive work, a major portion of which has been destroyed and forgotten owing to the vicissitudes of time and the domination of Iran by foreign nations. What remains today of this book was compiled in the early days of the Christian era. It comprises 15 out of the 21 original parts and if the extinct parts were proportionate in volume to those present about one-fourth of the book may be said to have perished.

From the philological point of view, the extant parts of the Avesta were not written in one period of history. On the contrary, its composition may be divided into three sections. The Gathas, which are composed in poetry, doubtlessly constitute the earliest part of the book. The Avesta is a collection of the Canon Laws and decrees of the Zoroastrian faith which were formulated in different ages. The last of these is contemporaneous with the rise of the Achaemenian power in the sixth century B.C. Possibly when Old Persian, i.e. the language of the coins and inscriptions of the Achaemenians, was current in the western and southern regions of the country, namely, Media and Parsa, Avestic happened to be the language of the eastern or at any rate of the north-eastern provinces of Iran.

Philologically speaking, the Avestic language runs parallel to and is contemporaneous with Sanskrit and, apparently, the origin of both these

languages can be traced back to yet another ancient language which was perhaps the original language of the Indo-Iranian Aryan stock.

The language of the coins and inscriptions of the Achaemenians, ever since they came to power in the middle of the sixth century B.C., is distinctly Aryan in character and is known as Old Persian. This language is also contemporaneous with Avestic, and the growth and development of the two dates back to the same age. There are reasons to believe that when Avestic was passing through the early stages of development in the eastern provinces of the Iranian plateau the Old Persian language was also making headway in the west and south-west of Iran.

With the establishment of the Achaemenian Empire the people of Iran suddenly found themselves to be the neighbours of various Semitic nations of western Asia including the regions of western Iran. The Semitic languages made an inroad into the country and their influence was so strong that the Aramaic language and script were officially adopted by the Iranians. The Achaemenian kings were men of liberal views and they guarded full freedom of belief to their subject races as well as liberty to develop their own languages. That is why the cuneiform Achaemenian inscriptions are recorded not only in Old Persian but also a parallel translation of the same runs of Syriac, Elamite, Nabataean, and Aramaic languages.

The establishment of the Achaemenian Empire saw the people of western Iran divided into two main groups, namely, the Medes and the Persians ("Parsis"). It appears certain that either they spoke the same tongue, i.e. Old Persian, or their languages had very close kinship with each other. We find no traces of the Median language in the Achaemenian inscriptions. Apparently, if the Medes had spoken a different language, the Achaemenian emperors who had employed the Syriac, Elamite, and Nabataean languages in their inscriptions would certainly not have ignored Median. Moreover, a couple of words of this language and the names of the Median chiefs that have come down to us suffice to establish the close affinity of Median with Old Persian.

From 330 B.C. when the Macedonians conquered Iran, Greek became the official language of the country and continued to enjoy the status for a long time. Right down to the Christian era Greek is the only language to be seen in the Seleucid and Parthian writings. Needless to say that during this span of three and a half centuries the Iranian languages continued to flourish. Old Persian, however, is an exception, which gradually went out of use. We can witness definite marks of decay in the Old Persian writings of the later Achaemenian period in contrast with those of the earlier one.

At the dawn of the Christian era we find two languages in the Iranian plateau running parallel to each other. One of these grew and developed in the eastern regions. This has always been called "Dari" by the Iranians. The other which flourished in the western parts of the country was known as "Pahlawi." These two languages have come down to our own times. Many dialects of "Dari" still continue to exist in the eastern regions of the Iranian plateau as far as the Chinese frontiers: the most important of these are spoken in the Pamir region.

The Pahlawi language has lived in the form of verse known as “Fahlaviyyat,” in the books written in Persian on the art of poetry and in dialects spoken in the north, south, and west of the country.

The above-mentioned two languages have very intimate relationship and these have apparently stemmed from the same origin. A number of Aramaic words, however, entered Pahlawi and these have been known as “Huzvaresh” or “Zuwarishn.” These words found their way also into books of lexicography. In the Indo-Pakistan sub-continent these have been erroneously given the name of the “Zend and Pazard” language. “Dari” was too far away to receive the impact of the Aramaic language. On the contrary, it accepted the influence of the eastern languages such as Tukhari, Sughdian, and Khwarizmi.

At first the Aramaic script was adopted for both the languages. Later, however, a change took place and certain Aramaic letters were put together in Pahlawi to form what later came to be known the Pahlawi script.

The Orientalists did not fully grasp the significance of these subtle technical differences and they have been treating old Pahlawi and Dari as one language. Consequently, they have been employing the terms Northern Pahlawi or the Parthian Pahlawi for the later language. In recent times, however, some of them have defined it as the Parthian language whereas Pahlawi itself has been referred to as the Southern or Sassanian Pahlawi.

The number of the extant pre-Islamic works of these two languages is very small. The most important ancient work in Dari consists of the Manichaean texts and translation of parts of the Avesta into old Dari known as “Pazand.” The contemporary Dari has also been employed in some of the inscriptions of Sassanian kings.

Both Dari and Pahlawi possessed literature of their own before the advent of Islam. This literature, unfortunately, has not come down to us.

The history of the earliest Iranian dynasties during the Islamic period begins from the year 205/820. The dynasties which sprang up in the eastern regions raised the structure of their national politics on the basis of language. Since the language of these tracts was “Dari,” the literature produced in it was bound to outshine Pahlawi literature.

In 429/1038 the Saljuq Turks poured out of Turkestan to invade Iran. They gradually conquered the whole country. Since they hailed from the east and their officials also belonged to this region, it was natural that they should adopt “Dari Persian” as their Court language, which they carried to the farthest corners of Iran. Consequently, in the first quarter of the fifth/11th century, Dari had attained the status of the common literary language of the whole country. It gained supremacy in other regions also where Pahlawi had been the popular spoken language until then.

From this date Dari became the undisputed literary language of Iran and, like many other dialects prevalent in the country, Pahlawi was reduced to the status of a dialect. The last vestige of Pahlawi in the form of inscriptions and coins in Tabaristan in the north of Iran date back to the middle of the fifth/11th century.

The first specimens of Pahlawi literature which belong to the early centuries of the Hijrah consist of a number of books of religious nature

which the Iranian Zoroastrians had written with the specific object of preserving their Canon Law. These books were taken to the Indo-Pakistan sub-continent when the Zoroastrians migrated there. European scholars have been publishing their texts since the last century. Amongst these, certain books are claimed to have belonged originally to the pre-Islamic Sassanian era. There is ample evidence, however, to prove that these were composed during the Islamic period.

What is now known of Pahlawi literature is confined to these very books and treatises. They suggest that Pahlawi literature had, at any rate towards the end of the Sassanian period, flourished on a vast scale. It is an undeniable fact that, while during the 400 years which immediately preceded the Saljuq period, Dari had been recognized as the literary language of the country; Pahlawi had flourished on the north, south, and west of the present day Iran. Of this only a specific form of verse known as "Fahlaviyyat" has come down to us, the quatrains of Baba Tahir-i 'Uryan of Hamadan being its most remarkable specimen.

B. The Beginning of Modern Persian Literature

The present day language of Iran is the latest evolutionary of "Dari" and is known as "Farsi" or the Persian language. The people of Iran themselves, however, have always employed the word "Persian" for whatever languages have flourished in the country. In the past the two languages under discussion which flourished simultaneously have been known as the "Dari Persian" and the "Pahlawi Persian."

The Persian language of today, namely, Dari, originated, as mentioned above, during the Muslim period in the east of Iran. The important centres of this language were the cities of Tranoxiana and Khurasan, to wit, Samarquan, Bukhara, Balkh, Merv, Herat, Tus and Nishapur. These centres extended even to Sistan. This explains why the most eminent poets of this language down to the Saljuq period hailed from these particular cities. Gradually, Dari expanded from Khurasan and Transoxiana to other parts of Iran, so that by the Ghaznawid period it had extended to Gurgan, Damghan, and Rayy, and by the Saljuq era it had travelled as far away as Adharbaijan, Isbahan, and Hamadan.

In the province of Fars it did not achieve the status of a popular language even in the days of Sa'di and Hafiz. That is why these two great poets have revelled in the mastery of this language and in the expression of their poetic genius through it. Both of them also composed verse in the Pahlawi dialect of Fars, popularly known as the Shirazi language.

The rules of prosody of Arabic poetry were formulated by Khalil ibn Ahmad. These were assiduously observed by the Iranian writers in their Persian works. Considerable literature was produced on the subject both in Iran and in the Indo-Pakistan sub-continent. Consequently, the same Arabic names were retained for Persian metres and rhymes, so much so that even the same Arabic word *afa'il* was employed for purposes of scansion. Metres can be classified into three groups, i.e. metres common to both Arabic and Persian, metres which were the outcome of the Iranian genius and did not exist earlier, and metres which were, on the reverse, typical of and exclusive to Arabic poetry.

Amongst the exclusively Persian metres the most well-known is the one employed in the quatrains of Baba Tahir 'Uryan of Hamadan. In the pre-Islamic times right up to the Achaemenian period the only verse known was the blank verse. Specimens of poetry preserved in the Avesta and Old Persian are all composed in blank verse. This type of poetry was also in vogue in Pahlawi and Dari, the two languages so closely related to each other.

The forms of Persian verse have also an independent character and they have not always followed the Arabic pattern. The "mathnawi," "tariji'-band," "tarkib-band," "musammat," "muthallth," "murabba'," "mukhammas," "mustazad," and "ruba'i" are all exclusive to Persian poetry, and they have originated solely in the Persian genius. Persian verse has also influenced Urdu and Turkish poetry. Similarly, the rhymed verse and many figures of speech own their origin to the creative genius of the Iranian mind. "Muwashshah" and "mulamma'" are also Persian in origin.

C. Different Epochs of Persian Poetry

The oldest extant specimens of Persian verse date back to the middle of the third/ninth century. But these fragments are not sufficient to afford us a true picture of the contemporary Persian poetry. What emerges beyond doubt, however, is the fact that the Tahirids (205/820 - 259/872) and later the Saffarids (254/867 - 296/908) played a worth role in ushering in a new era of Persian literature.

Throughout the fourth/tenth century Persian literature continued to flourish with remarkable success at the Samanid Court and in the vast regions lying between the Chinese frontiers and Gurgan on the Caspian Sea. The court of Nasr bin Ahmad, the Samanid ruler, is especially famous for the large number of poets associated with it. Since then the current of Persian literature has flowed continuously.

Modern Persian poetry, in its earliest stages, was characterized by a note of realism. The realist school held its own for 200 years until the end of the fifth/11th century. The greatest Iranian poets of this school who flourished during the fourth/tenth century were Rudaki (329/941), Shahid Balkhi (325/937) and Daqiqi (341/952). Early in the sixth/12th century it gave way to naturalism. Meanwhile, the Iranian Sufis had discovered in poetry a most suitable vehicle to disseminate their philosophical message to the people. Sufism or Islamic mysticism had become popular in Iraq in the middle of the second/eighth century. In the earliest stages it merely laid emphasis on piety and godliness and no elaborate system had yet evolved.

Kufah and Basrah were the earliest centres of this movement. Later, however, Baghdad stole the limelight and became associated with great names in mysticism. From Baghdad it spread out in two directions, viz, North Africa and the "Maghrib" on the one side and north-east of Iran, that is, Khurasan and Transoxiana on the other. In the West it came to be linked up with Greek thought, especially with Neo-Platonism and with certain Israelite doctrines. In the East, especially in Khurasan and Transoxiana, it developed kinship with the teachings of Manichaeism and Buddhism which had enjoyed wide popularity in these regions for centuries. From here it

travelled to India and developed in what may be called the Indo-Iranian school of mysticism.

This latter school gained immense popularity and through Iran it spread to Western Asia and even to North Africa. It still continues to exist in the entire Islamic world from the borders of China to Morocco. The great mystics of Iran chose Persian for imparting their noble thoughts to all classes of people. That is why most of the books of the Indo-Iranian school of mysticism were written in Persian prose or verse and the language of mysticism in the Indo-Pakistan sub-continent has always been Persian. Symbolism inevitably enjoys profound importance in the mystic cult. For fear of opposition at the hands of the devout the mystic poets were constrained to express their views and beliefs in the language of symbols.

They were, thus, destined to contribute to the special school of symbolism in Persian poetry. The earliest amongst the great Sufis to compose verse in this fashion is the celebrated poet Abu Sa'id Abu Khair (357/967 - 440/1049). Sana'i (437/1046 - 525/1131), Farid al-Din 'Attar (627/1229), and Maulana Jalal al-Din Rumi (604/1208 - 672/1273) may be considered the greatest of the symbolists among the poets of Iran. Hadiqat al-Haqiqah of Sana'i, Mantiq al-Tair of 'Attar and the Mathnawa of Rumi may be regarded as the most important books of mysticism ever written in Persian.

On account of this great tradition Persian poetry produced during the whole of this period in Iran and the Indo-Pakistan sub-continent is steeped in mysticism. The recital of this kind of verse in the assemblies of prayer and devotion among different sects of Sufis, at times to the tune of music and occasionally to the accompaniment of dance, has been regarded as one of the most important observances of the mystical creed. Even men who did not belong to any school of mysticism had to compose, whether they liked it or not, their poetical works, especially their "ghazals," in a mystical strain.

Mystic poetry of Iran and the Indo-Pakistan sub-continent forms a subject that requires a very elaborate discussion. In fact, it is one of the most profound literary and philosophical themes of all times. The Iranian mystics, apart from expounding the fundamental doctrines and essential principles which have deep academic and philosophical significance and are the especial concern of those wholly steeped in mysticism, have also instructed the common folk on what is popularly termed as generosity and manliness (futuwwat).

This teaching mainly consisted of certain moral precepts and aimed at inculcating amongst the common mass of people the feeling of manliness, courage, forgiveness, and generosity, and might be compared with the institution of knighthood or chivalry prevalent in Europe in the Middle Ages. Many books were produced on this subject in Arabic and Persian and these have been known as books of generosity and manliness (Futuwwat Nameh). This particular institution travelled from Iran to all the Islamic countries as far away as North Africa and the "Maghrib" and is still lives in many parts of these lands.

It may be pointed out that mystical verse in the Persian language has provided the civilized humanity with the most cosmopolitan type of poetry,

and this branch of Persian literature excels all other kinds of poetry both in sweep and charm.

In the pre-Islamic Iran epic poetry and national sagas had always enjoyed wide popularity. In the Islamic period this tradition was not only maintained but it also received further impetus. Initiated by a few earlier poets it found its culmination in Firdausi's (411/1020) great classic Shah Nameh, which remains to be one of the most outstanding epic poems of all times. He completed its first narrative in 384/994, and the second in 400/1010. In this field, as in many others, Persian literature is immensely rich. A number of epic poems were composed in successive ages in Iran and in the Indo-Pakistan sub-continent, and this tradition was maintained until a century and a half ago.

Amongst the most important of these are, chronologically speaking, Garshasp Nameh of Asadi (465/1073) which was completed in 458/1066, Wis-o Ramin of Fakhr al-Din Asad of Gurgan (middle of the fifth century A.H.) and the quintet (khamseh) of Nazami of Ganjeh who remained devoted to its composition from 572/1176 to 599/1202. Nizami's style in epic poetry won especial favour both at home and in the Indo-Pakistan sub-continent and a number of poets wrote under this unique influence, amongst the most notable of them being Amir Khusrau of Dhelhi (651/1253 - 725/1325), Khwaju-i Kirmani (689/1290 - 763/1362), and Jami (817/1414 - 898/1493).

This typical epic style has left a deep impress on the Turkish language, and many Turkish poets have imitated it, some of them merely translating the same contents into their own language. Amongst these may be counted the epic poems of Mir 'Ali Sher Nawa'i (844/1440 - 960/1500) composed in the Chaghata'i, i.e. the eastern dialect of Turkish, and the epics of Fuzuli of Baghdad (970/1562) in the Azari, i.e. the western dialect of the Turkish language.

Among the other chief characteristics of Persian poetry are the composition of philosophical verse and the introduction of philosophical generalities in poetry composed in simple language. We have it on the authority of the oldest specimens of Persian poetry that poetry and philosophy had forged a close link together ever since Persian poetry originated in Khurasan and Transoxiana. The most important book on practical philosophy to have gained immense popularity amongst Muslims in general and the Iranians in particular in the early Islamic period was Kalileh wa Dimneh which was at first translated from the original Sanskrit work Panchatantra into Pahlawi and presumably brought to Iran in the sixth century A.D. in the reign of Khusrau Anushirwan (Nushirwan the Just).

It was translated from Pahlawi into Syriac about the same time. In the early Islamic period the famous Iranian scholar ibn al-Muqaffa' rendered it from Pahlawi into Arabic. It was later versified by Rudaki, the greatest poet of the Samanid period and one of the great names in Persian poetry in its whole history of the last 1200 years. Only a few couplets of this long poem have survived.

Another book which dealt with practical philosophy like Kalileh wa Dimneh was the famous work Sindbad Nameh. This was also rendered into

verse by Rudaki. That is why his name has been prefixed with Hakim or philosopher since old. This also suggests that there was a considerable element of philosophy in this poetical works. Another great contemporary of Rudaki, namely, Shahid Balkhi, was known as one of the famous philosophers of his time. He had also entered upon a controversy with yet another famous physician-philosopher Muhammad bin Zakariya Razi and composed some treatises in refutation of his views.

Afterwards, many Iranian poets expounded valuable philosophical themes in their works and were known as philosophers. Kisa'i of Merv was one of them. Firdausi and 'Unsuri also enjoyed the title of Hakim or philosopher for having introduced philosophical themes in their works. The great poet Nasir Khusran (394/1004 - 481/1088) expounded philosophical thought in all his poetical works in addition to a few books of philosophy that he wrote in Persian prose from the Isma'ite point of view. The Isma'ilites of Iran always attached great importance to the Persian language in disseminating and inculcating amongst others the philosophy of their own sect. That is why they were even known as the "educationists" or "Ta'limites."

The poets of this sect always introduced an element of philosophy in their works. Amongst the eminent Iranian philosophers and thinkers, Persian verse has been ascribed to Abu Nasr Farabi (d. 339/950), ibn Sina (d. 428/1037), Khuwaja Nasir al-Din Tusi (597/1201 - 672/1274), Imam Fakhr al-Din Razi (554/1159 - 606/1209), Afdal al-Kashani (d. 615/1218), Shihab al-Din Suhrawardi Maqtil (d. 587/1191), Jalal al-Din Dawwani (830/908 - 1426/1502 - 1503), Mir Sayyid Sharif Gurgani (740/816 - 1339/1413), Mir Muhammad Baqir Damad (d. 1041/1631), Sadr al-Din Shirazi, i.e. Mulla Sadra (d. 1050/1640 - 1641), and Haji Mulla Hadi Sabziwari (1212/1295 - 1797/1878).

One can say that there was hardly any philosopher in Iran who did not express his beliefs in poetry. Some of them like Afdal al-Din Kashani composed a considerable amount of verse. Philosophical thought also found expression in the quatrains of the famous scholar and philosopher 'Umar Khayyan (d. 517/1123 - 1124). The collection of these quatrains forms today one of the most famous books in the world, and has been translated into almost all the civilized languages including many dialects of Pakistan and India. One of the most important features with which we are confronted in Persian literature, irrespective of prose or poetry, is the effort on the part of the Iranian philosophers to affect Plato, Aristotle, Plotius, the Stoics, Zeno, and scepticism as well as a part of the philosophical teachings imparted in Alexandria and Edessa, and the fundamentals of Islam. Some of them harmonized mysticism with philosophy and divine law, and in this field Persian is decidedly the richest language in the world.

In the eighth/14th century Hafiz, the great immortal poet of Iran, while following the naturalist school which had reached its highest point of glory in Rumi's poetry (606/1200 - 691/1292) had laid the foundation of impressionism in Persian poetry. This school did not find its roots in Iran for about a hundred years and it was only at the end of the ninth/15th century that a few great Persian poets lent it a new charm and colour. This was the

time when the Mughul dynasty had reached the height of its power and splendour in the Indo-Pakistan sub-continent. Persian enjoyed the status of official language of the Mughul Court. All notable men of the sub-continent had fully imbibed Persian culture in all walks of life.

Every year a large number of Iranian intellectuals and artists would travel to the Indo-Pakistan sub-continent either to settle down there permanently or to make it a temporary home. These scholars introduced this school of poetry in India where it won immense popularity. It found its highest expression at the Courts of Jalal al-Din Akhbar (r. 963/1556 - 1014/1605) and his successors, namely, Jahangir (r. 1014/1605 - 1037/1628), Shahjahan (r. 1037/1628 - 1068/1658), and Aurangzib (r. 1069/1658 - 1118/1707). Under the patronage of these Courts, rich and exquisite works of poetry were produced. There are a large number of poets who attained eminence in this style, popularly known in Iran as the Indian School of Poetry.

Among them ‘Urfi (963/1556 - 999/1591), Naziri (1023/1614), Zuhuri (1024/1615), Talib Amuli (1036/1627), Qudsi (1056/1646), Kalim (1061/1651), and Sa’ib (1012/1603 - 1083/1672) had been attracted from Iran and they provided both stimulus and schooling in numerous well-known poets of the local origin. The most brilliant amongst this galaxy of poets were Faidi (953/1546 - 1004/1596), Abu al-Barakat Munir (1055/1645 - 1099/1688), Ghani (1072/1661), Nasir ‘Ali (1108/1696), Ghanimat (1107/1695), Ni‘mat Khan ‘Ali (112/1709), Bidil (1134/1722), Nur al-‘Ain Waqif (1191/1776), Siraj al-Din ‘Ali Khan Arzu (1169/1756), Ghalib (1213/1798 - 1285/1868), ‘Ubaidi Suhrawardi (1306/1889), Shibli Nu‘mani (1274/1857 - 1332/1914), Girami (1345/1926) and many others. The literary tradition bequeathed by them still lives in the Indo-Pakistan sub-continent.

The last great poet of the Persian language in the Indo-Pakistan sub-continent was Muhammad Iqbal (1289/1873 - 1357/1938) who infused a new life in Persian poetry, rejected the impressionist school that had preceded him, and revived the symbolist traditions with magnificent results.

In Iran a new movement in poetry made itself manifest at the end of the 12th/18th century which promised pastures anew. As a consequence, most of the poets returned to naturalism. The tendency to revitalize and revivify Persian verse and to bring it closer to Western poetry is distinctly visible in Iran. There are even attempts at going to such extremes as surrealism. The younger Iranian poet is, however, passing through a period of transition and has yet to determine his final attitude. Nevertheless, one comes across exquisite pieces of poetry produced by some of the poets and poetesses of the younger generation. This augurs well for a great future. It is not unlikely that a new school of poetry will emerge before long.

One who wishes to study the evolution of Persian poetry and its different schools and styles in minute detail will perforce have to make a deep study of the works of quite a few hundred poets of Iran, Afghanistan, Central Asia, Pakistan, India, and Turkey - men who selected this language as their medium of expression and stuck to the Iranian tradition of poetry.

It may be observed that all the important poets of Persian language, whether they were of the Iranian or Indo-Pakistani origin, or whether they hailed from certain Central Asian and Caucasian regions formerly treated as

parts of Iran, were Muslims. Only with regard to Daqiqi, the celebrated poet of the Samanid period, it has been contested by a few scholars that he belonged to the Zoroastrian faith. Be even this cannot be taken for granted. In the eight/14th century, however, a Zoroastrian poet Bahram bin Puzdhu rendered two books of the Zoroastrian religion into verse, namely Zartusht Nameh and Arda Viraf Nameh.

D. Persian Prose

Modern Persian is today one of the richest languages in the world. It retains a link, close or distant, with all the Aryan languages in the East as well as those in the West. It, thus, bears a close resemblance to all these languages in respect of grammar, syntax, and composition. However, on account of the deep attachment of the Iranian scholars to Islamic learning and sciences on the one hand and to Arabic language on the other, Persian became progressively richer and vaster language.

In the middle of the first/seventh century when the people of Iran embraced Islam, the Arabic language gained a complete hold on that country. It came to be looked upon not only as the language of religion but also one of arts and letters. During the early period of the 'Abbasid Caliphate when a strong movement was launched to produce scientific and literary works in Arabic, the Iranians played a very important role in it. They were also conspicuous in rendering translations of Pahlawi, Syriac, and at times even Greek works. They also composed a large number of original works in Arabic. After this Arabic became so widely popular and gained such an immense hold on Iran that the most important books in the field of Arabic grammar and lexicography were written by the Iranians.

Many of the Persian poets composed Arabic verse and some of their works have been acknowledged amongst the finest and most exquisite specimens of Arabic poetry. The Iranian philosophers adopted Arabic as the medium of their expression from the very beginning. Only a few of them ever attempted to compose their philosophical works in Persian. Books produced in Iran on the subjects of astronomy, mathematics, and medicine was mostly written Arabic. Some of the Iranian historians also selected Arabic as their vehicle of expression. Most of the religious literature, including jurisprudence (Fiqh), Hadith, and commentary on the Holy Qur'an, were also produced in Arabic.

From the earliest period the Persian language had imported Arabic elements. Especially in the domain of technical terms Persian was completely overwhelmed by Arabic. Incidentally, the Iranians have given special meanings to many Arabic words which have also passed into Urdu in their changed Persianized sense. The overwhelming influence of Arabic on the Persian language is traceable in different epochs of Iranian history.

However, we find that some of the great scholars of Iran like ibn Sina, Nasir Khusrau, Afdal al-Din Kashani, and Abu Raihan al-Biruni have at times shown in their Persian works a tendency to coin fresh Persian words instead of employing the current technical and scientific Arabic terms. Certain other writers have also shown a tendency to employ new compound epithets of purely Persian origin in their works. The outstanding specimens

of this trend in the Indo-Pakistani Persian literature are visible in A'in-i Akbari of Abu al-Fadl.

The excessive use of Arabic words in Persian prose started in the fifth/11th century. Kalileh wa Dimneh which was rendered into Persian by Nasr Allah b. 'Abd al-Hamid from the Arabic version of bin al-Muqaffa' may be regarded as the first specimen of this type of writing. Amongst other books written in this style may be enumerated Marzban Nameh of Sa'd al-Din of Varavin, Tarikh-i Wassaf, Tarikh-i Mu'jam, and Durrah-i Nadirah, the last being the work of Mirza Mehdi Khan, the historian of the Court of Nadir Shah. But the number of such books is very small. In fact, 99 Persian books out of 100 have been written in simple and direct style and they have always reflected the contemporary idiom, except where a writer has deliberately digressed from the natural style to employ Arabic phrases, a tendency which had been regarded as a kind of literary treat.

As a result of the systematic development of Persian poetry and use of symbolism, Persian prose evolved a new style in which the writer would lay the highest emphasis on allusions, metaphors, and rhetorical devices. We notice the same trend in the recent prose styles of some European languages. This is exceedingly sophisticated style of Persia prose in which the content was obscured by vague rhetoric and long repetitious sentences reached its zenith in the ninth/15th and tenth/16th centuries. It also penetrated into the Indo-Pakistan sub-continent where we find in Seh nathr-i Zuhuri and Rasa'il-i Tughra-i Mashhadi its most outstanding specimens.

This style won remarkable popularity in the field of Court documents, royal commands and decrees, and official correspondence. The tradition passed on to the Indo-Pakistan sub-continent and found its finest expression in Manshaat-i Abu al-Fadl Allami. It also found its way to Turkey and during this period the official correspondence of the Ottoman Caliphs was wholly conducted in the same style as that in Persian. The "Court style" originated in Iran in the sixth/12th century, enjoyed a large, uninterrupted era of popularity and found its best specimen in Manshaat-i Mirza Tahir Wahid composed in the 11th/17th century. It was, however, dealt a fatal blow by Mirza Abu al-Qasam Qa'im Maqam Farahani (1193/1779 - 1251/1835) whose prose was distinguished for the simplicity and purity of its style.

The contemporary Persian prose has a highly simple, facile, and elegant expression. It has freed itself from the conventional ornate and abstruse style. Today it has drawn itself far closer to the idiomatic and colloquial Persian expression than ever before.

During the long history of Persian prose a very large number of books have been written in all branches of knowledge such as jurisprudence, commentary on the Holy Qur'an, scholastic theology, mysticism, philosophy, medicine, mathematics, astronomy, arts, ethics, tales and fables, and even such subjects as handicrafts. However, a majority of prose works in Persian have always been confined to history and practical ethics. That also explains why all books on the history of the Indo-Pakistan sub-continent during the Islamic period have been produced in Persian. On this very account some knowledge of Persian may be regarded as an essential

pre-requisite for learning history of some of the Asian countries. In fact, Persian literature may be divided into poetry and history as its two main component parts.

E. Persian Grammar and Lexicography

For a long time the Iranians paid no heed to Persian grammar since they were no strangers to the rules of their mother tongue. The only expositions of Persian grammar in the past consisted of brief notices which some of the grammatical works started in right earnest when during the Mughul rule in India Persian became the literary as well as the Court language of the subject were for a considerable time confined mostly to the Indo-Pakistan sub-continent alone.

In the field of Persian lexicography as in grammar, not much interest was shown in the past. The works produced contained a rather limited number of uncommon words employed in poetry. When a proof was required regarding the authenticity of a certain word, it was furnished from the couplets in which it had been used.

It is quite apparent that at first the necessity for such dictionaries arose in the western parts of Iran where Dari was not the language of the people. The first dictionary to have ever been produced in Persian was compiled by Qatran Urumawi, the famous poet who lived in Tabriz and died in 465/1075. This book is now extinct. After him Asadi of Tus, who also lived in Adharbaijan and died in the same year as Qatran, completed his famous dictionary which is the oldest extant work on the subject.

As mentioned earlier, the Saljuqs had carried their official language, Dari, right into Adharbaijan in the wake of their conquests. Since the people of this province spoke Pahlawi, they found it difficult to understand meanings of certain words which were familiar to Dari but did not exist in Pahlawi. Hence, the urge to compile these works in Adharbaijan.

The most important role in the compilation of dictionaries was undoubtedly played by lexicographers of the Indo-Pakistan sub-continent. During the Mughul period the Court language of the Empire was Persian. People, for whom it was not the mother tongue, stood in need of books for guidance and help. In the 11th/17th century special attention was paid to this work, though dictionaries had been in the process of compilation since a hundred years earlier.

For a long time the works of the Indo-Pakistani lexicographers or those of the Iranian scholars who had migrated to the sub-continent continued to be the most authentic source of reference even for the Iranians themselves. The most outstanding of these books are Farhang'i Jahangiri of Jamal al-Din Inju, Farhang'i Rashidi of 'Abd al-Rashid of Thatta, Burhan-i Qati' of Muhammad Hussain Tabrizi, Asif al-Lughat of 'Aziz Jang Bahadur, Bahar-i 'Ajam of Tek Chand Bahar, Chiragh-i Hidayat of Siraj al-Din 'Ali Khan Arzu, Ghiyath al-Lughat of Muhammad Ghiyath al-Din, Farhang-i Anand Raj of Muhammad Padshah Shad, and Mustalihat al-Shu'ara compiled by Varasteh.

The number of lexicographical works compiled in the Indo-Pakistan sub-continent exceeds 100 of which the oldest, viz. Adab al-Fudala' of Qadi Khan Badr Muhammad of Delhi, was completed in 822/1419. In other

words, the period during which these works were diligently and assiduously produced extends to about 500 years.

The necessity of compiling such dictionaries was also felt in Turkey where Persian enjoyed the status of a literary language at the Turkish Court of the Ottoman Caliphs and many a Turkish scholar produced literary works and composed poetry in Persian, so much so that even some of the Turkish emperors composed poetry in the language. As a consequence, a few dictionaries, to wit, Lughai-i Halimi, Lughat-i Sha'uri, Dasinah-i Kabir and Lughat-i Shah-nameh of 'Abd al-Qadir Baghdadi, were edited in Turkey. But as against the dictionaries produced in the Indo-Pakistan sub-continent in which the meanings of words were also explained in Persian, in Turkey the meanings and explanations were given in Turkish. The Iranians themselves, therefore, have not been able to utilize these works.

To no other area of the world does the Persian language and literature owe so profusely as to the Indo-Pakistan sub-continent. Not only have the scholars there written hundreds of very useful books on subjects as varied and diverse as history, lexicography, grammar, mysticism, biographies of poets, and commentaries on certain Persian texts, and have preserved and jealously guarded many books lost to posterity in other countries and even in the Persian language. There is hardly any big city in the Indo-Pakistan sub-continent where a number of Persian books have not been published. The number of such published works stands at 2,000.

F. Influence on Persian Literature

The history of modern European powers in the East dates back to the Renaissance period. Iran was one of the earliest countries to have come into contact with the West. At first it was the Christian missionaries who set foot on Muslim lands with a view to propagating their religion. They were, thus, introduced to the rich treasure of advanced sciences that had accumulated there through centuries but were unknown to the West. They learnt the Arabic and the Persian languages in order to acquaint themselves with the rich philosophical thought and the subtle beauties and artistries of Persian literature. At first works of Persian classics were rendered into Latin and soon after these were published in some other prominent European languages such as French, English, German and Italian.

The earliest Persian work to have translated into a European language was Gulistan of Sa'di. Gradually, the works of Firdausi, Hafiz, 'Umar Khayyajm, Nizami, Jami, Jalal al-Din Rumi, Farid al-Din 'Attar, Nasir Khusrau, and others were translated. These eminent stars on the firmament of Persian literature are now regarded in all Western countries as amongst the great immortals of world literature. It was the dissemination of their thought which provided stimulus to numerous European poets and writers of the 13th/19th century to take inspiration from Persian writers. This influence was at times fully revealed in their works and at others was reflected in their thought.

One of the earliest amongst them was Dante, the Italian poet, who was inspired to write his Divine Comedy in which he describes his spiritual flight into heavens and the next world under the influence of Iranian literature. Next, it was the great German poet Goethe who was thrilled by

the sheer beauty of Persian literature through German translations of Persian poetry, and who had even pursued for some time the study of Persian language in order to have a fuller appreciation of its literature. He even dedicated to it one of his works *West-ostlicher Divan*, and gave to a section of this book the title of “*Kitab-i Hafiz*.”

The well-known English poet Edward Fitzgerald also published a small collection known as *Rub‘iyat-i ‘Umar Khayyam* which he claimed to have translated from the Persian collection of Khayyam’s quatrains. Actually, however, not all these quatrains are by Khayyam himself; some of these are the work of other Persian poets. As such, this collection reflects the thought of a number of Iranian philosophers.

Many of the European poets and writers who acquainted themselves with the thought of Persian poets through translations in Western languages have produced delightful works associated with Persian literature. Mainly, however, they have come under the spell of Khayyam, Sa‘di and Hafiz.

Chapter 54: Turkish Literature

A. Development of Turkish Prose and Poetry

The earliest surviving written documents of Turkish literature date from the first/seventh century. They consist of short inscriptions in the so-called “Runic” letters in the Upper Yenisei Valley in Siberia. Lengthier documents of the same linguistic type and in the same script survive in the valley of the Orkhon in Outer Ungolia and date from the second/eighth century. These consist of inscriptions in two steles in honour of two princes of the Turkish dynasty of the Eastern Kok Turk State, and a third erected in honour of its old minister. The history of the Eastern Kok Turk is here related in a semi-legendary and artistic way. Other inscriptions in the same script, large and small, are known in Mongolia, Siberia, and Western Turkestan. Manuscripts too, belonging probably to the third/ninth century, have been found. The language of the Turkish runes is characterized by a certain archaism in its phonetics, morphology, and vocabulary.

From the second/eighth century onwards the Uygur Turks became acquainted with Manichaeism, Buddhism, and Syrian (especially Nestorian) Christianity in Northern China and East Turkestan and developed a high culture within the framework of Far Eastern civilization which lasted until the seventh/13th century. The surviving Uygur manuscript and xylographic literature is very extensive and proves a high cultural activity in the fields of religion, philosophy, and other sciences. The script used for these literary works was mainly the Uygur alphabet, derived from the Soghdian script. In addition to the Uygur alphabet, however, these Turks used, besides the ancient Turkish runes, the Manichaen, Syraic, and Brahmi runes.

The Uygur alphabet remained in use until the 12th/18th century among the Turks of China who did not adopt Islam. The conversion to Islam (from the fourth/tenth century onwards) of the Turks of Central Asia was followed by the adoption of the Arabic alphabet. However, the Uygur alphabet remained in use as the Court script. It was given a new lease of life in the Muslim territories by the Mongol conquest, and was used in the seventh/13th to the ninth/15th centuries among the Golden Horde and the Timurids for the Kipchak and Chaghata'i languages. As late as the early tenth/16th century there were still in the Imperial Chancellery in the Istanbul scribes skilled in writing the Uygur script.

The Uygur Turkish or, to use a more suitable term, the old Turkish literary language (for the civilization that used it was wider than the geographical or historical limits of the Uygur State) shows, broadly speaking, the same dialectical peculiarities as the Kot Turkish monuments. The few dialectical divergences are obviously in the main due to the passage of time and to influence from the outside.¹

The conversion to Islam of the Turks of Central Asia began in the fourth/tenth century. Throughout history the Turks proved to be devoted Muslims and zealous defenders and promoters of Islam. Founded on the literary Uygur of the pre-Islamic period, there developed in the fifth/11th century under the Karakhanids, converts to Islam, the Muslim Turkish literary language of East Turkestan written probably from the first in the Arabic alphabet. The best known documents in this language are two

didactic poems, the Qutadhghu Bilig (The Science of Happiness), composed by Yusuf Khas Hajib, and the 'Atabat al-Haqa'iq (The Threshold of Facts), composed by Adib Ahmad. There is, further, a translation of the Qur'an. Besides these works there is another dating from the same century, the Diwan-o Lughat al-Turk of Mahmud al-Kashghari composed in Baghdad in Arabic in order to acquaint the Arabs with the Turkish world. It is a very valuable source for the investigation of the various Turkish tribes, dialects, folk literature, customs, culture, etc. of this time.²

Islam was established in the fourth/tenth century in the Bulghar kingdom of Kama also. But data are lacking to enable us to decide if there also existed any literature. In any case Bughar elements are found in the sepulchral inscriptions of the eighth/14th century in the Volga region.³

The development of literary Turkish in central Asia went on without interruption, but its centres changed from time to time.

The absence of early manuscripts prevents us from giving a definite name to the language of the Hikmats (theological didactic poems) of Ahmad Yasavi, the founder of Turkish mysticism, who lived in the sixth/12th century in West Turkestan.

In the seventh/13th century the various literary dialects of the Muslim Turkish world were not yet clearly differentiated from one another. The formation of the Mongol Empire, which embraced almost the whole Arabic world of the period, created for a time an atmosphere favourable to the development of uniform language for a considerable section of the Muslim Turkish peoples. At first Turkish literary activity under the Saljuqs in Asia Minor was to some degree bound up with that of Central Asia and Eastern Europe. The seventh/13th century, however, is an epoch of political agitations in Asia Minor and Eastern Europe. It is, therefore, only in the next century that literary works are mainly to be found.⁴

Literary activity on the northern shores of the Black Sea, in Khwarizm which included the mouth of the Sir Darya, in the Capital Saray, and in the Crimea attained a considerable development by the beginning of the eighth/14th century but no uniform literary language developed. The elements of the literary language of the Karakhanid period were combined with those of the local spoken dialects. In Syria, Egypt, and Persia under Turkish or Turkicized rulers there grew an interest in Turkish. Thus, we find a series of grammar books and lexicons in Arabic from the sixth/13th century until the beginning the tenth/16th century. They all deal with the Kipchak but contain elements from other Turkish dialects in varying degrees.

The prose work Qisas al-Anbiya' (Stories of the Prophets), with passages in verse written by N. Rabghuzi, finished in 710/1310, although lacking aesthetic value, is of great literary importance. Another religious work in verse is the Mu'in al-Murid of Sheikh Sharif Khuwaja (713/1313). The very attractive romance in verse, Khusraw wa Shirin of the poet Qutb (742 - 743/1341 -1342), although based on the corresponding Persian work of Nizami, has nevertheless many original passages. Khwarizimi's poem Mahabbatnamah (The Book of Love), composed in 754/1353, is another work of high literary merit. Seif-i Saray's translation of Gulistan (The Rose

Garden) that appeared in 782/1380 is another prose and verse book of high literary value. The religious work Nahj al-Faradis (Way to the Paradise) of Mahmud b. 'Ali (716/1316) is, properly speaking, a "40-Hadith" book in simple prose with no aesthetic aims. Finally, it may be mentioned the religious prose work of Mi'rajnamah (Book of the Ascension) composed for didactic purposes.

Further, there are other works written in Egypt and Syria which are: a Siyar book composed in 784/1382, Irshad al-Muluk w-al-Salatin composed by Barka Faqih in 789/1387, Kitab fi al-Fiqh bi al-Lisan al-Turki, originating probably from the ninth/15th century, Kitab fi 'Ilm al-Nashshab wa Kitab fi Riyadat al-Khail, a book on the art of horsemanship translated from Arabic for soldiers in about 808/1405, Kitab al-Da'wa, another book on the art of horsemanship also translated from Arabic in 844/1440.⁵

We may date to the eighth/14th and ninth/15th centuries the beginning of the development of the different literary languages in different parts of the Muslim Turkish world.

The Chaghata'i language and literature which developed under the Timurids, the descendants of the second son of Chingiz Khan, represent the most brilliant phase of the development of Central Asiatic Turkish literature. Names are known of a few Turkish poets who lived to the first half of the ninth/14th century. Sakkaki was a panegyrist. Another famous poet was Lutfi. To the same period belong the panegyrist Mir Haidar Majdhub (Turkish Tilbe), Amiri, Sayyid, Ahmad Mirza, Gada'i, Yaqini, and 'Ata'i.

In the second half of the century Chaghata'i literature reached its zenith in Mir 'Ali Shir Nawa'i. In his Diwan (Book of Poems) as well as in his numerous other verse and prose works he does not merely imitate the Persian poets, as was the case with his predecessors, but knows how to suit the taste of his contemporaries. He has, therefore, enjoyed great popularity right down to the present day all over the Turkish world. Of importance is his Muhakamat al-Lughatain (The Contest of Two Languages) in which he endeavours to show that the Turkish language is no less suitable than the Persian for poetical works and intellectual purposes. He is also the first composer of Turkish collection of the biographies of poets. Nawa'i is considered to be one of the greatest personalities and intellectuals in Turkish literature. The prince and patron of Nawa'i, Sultan Hussain Baiqara, was also a poet.

The founder of the Timurid empire in India in the first half of the tenth/16th century, Babur Shah, was also the author of a number of poems, but he is most celebrated for his Khatirat-i Babuir (Memoirs of Babur) or Buburnamah (Babur Book) very vividly relating his life and expeditions as well as describing the life and topography of India. He is considered the second great personality of Chaghata'i literature.

Minor personalities of the classical period are Hamidi, Muhammad Salih, Shabani, etc.

Under the Uzbeks, who drove the Timurids out of Central Asia and eastern Persia in the second half of the tenth/16th century, Turkish poets and writers stuck to old Chaghata'i models without producing anything new or original. The historian Abu al-Ghazi Bahadur Khan in the 12th/18th century

probably stands alone in endeavouring to avoid in his work Persian and Arabic as well as Chaghata'i Turkish words.

Of importance in Mirza Mehdi Khan's Sanglakh (Stony Place), a Turkish Persian dictionary composed in 1174/1760 with its extensive preface on classical Chaghata'i Turkish grammar containing comparisons with Anatolian Turkish.

The same Turkish literary language as was written in the land of the Uzbeks is written to the present day in Chinese Turkestan. Here also Turkish culture has been influenced by Persian.

In the 14th/20th century a new Turkish literature based on the local dialects has been founded under Russian and Kazan Turkish influences. It includes dramatic works among its productions. In accordance with the State policy of the new regime, a special alphabet in Cyrillic letters has been created for the Uzbek language.⁶

From the fifth/11th century onwards Turkish tribal and military units began to make raids into Asia Minor, so that Anatolia lay totally open to the Turks. Thus, the colonization of Asia Minor and Eastern Europe went on with great success. Thanks to the ability of these Turks to adapt themselves in course of time to the changing circumstances of life, they succeeded in founding on very firm bases a strong and lasting State.

Parallel to the political and social development, Anatolian Turkish literature has had an uninterrupted development from the time of the Saljuqs down to the present day. It has, therefore, become the most important and richest branch of all the Turkish literatures and has exercised an influence on the literature of other dialects.

Seventh/13th Century

Already in the seventh/13th century there developed in Anatolia a Turkish literature based mainly on the Oghuz dialect. The well-known Persian mystic Jalal al-Din Rumi and his son Sultan Walad produced some Turkish verses, Ahmad Faqih wrote a fairly long mystic poem, and Shayyad Hamzah left poems of different genres.

Yunus Emre was the greatest figure in this century. He is regarded as the best Turkish popular mystic poet. His art is essentially one of the people, i.e. it is Turkish. It was through his mystical verses that there developed a tradition of writing poems in the language of the people and in the popular syllabic metre, which did not lose its power even in the period when Persian influence was at its highest.

Classical profane literature had its first representative in Dahhani. His poems were in an elaborate style and attained a high degree of perfection from the technical point of view.

Another poem of this century was 'Ali's Qassah-i Yusuf (Story of Joseph), representing linguistically a mixture of Central Asian literary Turkish and the vernacular Oghuz dialect. Moreover, other works of this and even next century had more or less the same peculiar features, and the rather pure Oghuz dialectical features in the manuscripts of works of these centuries are probably to be ascribed to the later copyists.⁷

Eighth/14th Century

The literary development followed the same line in the eighth/14th century. A certain number of feudal princes in Asia Minor lacked Persian or Arabic culture, and this was the reason why the language of the people became important, why books were written in Turkish, and also why a number of Muslim works were translated from Arabic and Persian into Turkish. During this century there developed in Anatolia several cultural centres, such as Qunyah, Nigde, Ladik, Kastamonu, Sinop, Sivas, Kirsehir, Bursa, and Iznik.

Among the leading poets Ahmad Gulshahri should be mentioned for his artistic merit. He put into Turkish the Mantiq al-Tair (Speech of Birds) of the Persian poet 'Attar, expanding it with stories from various sources. We also possess a number of isolated poems of his. Although a mystic, his literary aims were purely artistic.

The great mystic of this century is, however, 'Ashiq Pasha with his long poem Gharibnamama (Book of the Stranger). He is a mere imitator of Jalal al-Din Rumi and Sultan Walad. There also exist a number of detached mystical poems from the pen of 'Ashiq Pasha, but all are far from showing the lyrical merit of Yunus Emre.

In the second half of the century we find classical mystic poetry attaining high perfection in Nasimi. He is a great poet whose mystic lyrics are most expressive. His style is simple but full of power and harmony. In his Diwan we find tuyughs a verse-form peculiar to Turkish classical poetry and foreign to Persian literature.

Romantic tales and fables were also taken from Persian literature. Among them is to be mentioned Mas'ud's love story in verse, Suhail wa Naubahar (two proper names), a translation or rather an expanded adaptation from an unknown Persian work. This story has considerable literary value.

But, with the exception of Nasimi, Ahmadi is the greatest poet of this period. He is the author of the Iskandarnamah (Book of Alexander). The subject is taken from Persian sources, but he adds a long section dealing with world history including the Ottoman dynasty. His Diwan is more interesting from the artistic point of view. Among his poems there are some which are of local interest.

Further, we must mention Qadi Burhan al-Din who has left a Diwan also containing tuyughs. His poems have a note of sincerity and passion of their own. He is the first to have attained perfection by the standards of classical rhetoric.

Of the prose works are to be mentioned an anonymous translation of Kalilah wa Dimnah and the legendary tales of Dede Qorqut mainly about the Muslim-Christian struggle during the Turkish invasion of Anatolia and its vicinity, reflecting vividly the life, customs, and ideals of the Turks of the fifth/11th and sixth/12th centuries.⁸

Ninth/15th Century

In the ninth/15th century Turkish increased in importance as a literary and official language. In the first half of the century there were three great princely families who were patrons of scholars and poets: Karamanoghli at Aunyah, the Jandaroghli at Kastamonu, and the Ottoman Princes in Edirne

and Bursa. As in the preceding centuries, the literary activity under them was not confined merely to the translation of Muslim works of a classical character.

In popular religious literature we may mention the Maulid (Birth of the Prophet) poem of Sulaiman Chalabi and Ahmad. This fine work has all the qualities of a masterpiece. It has been read by the people, for centuries particularly on the occasion of the religious commemoration of a dead person. In every century many similar poems have been written in imitation of it.

The most important classical poet of this period is Sheikhi. His version of Khusrau wa Shirin of the Persian poet Nizami is more than a mere translation. The Kharnamah (Story of the Donkey) is a masterpiece of satire. He is also the author of a Diwan which contains a considerable amount of panegyrics and love poems. His part in the establishment of classical poetry is great. His influence continued down to the tenth/16th century.

Another great classical poet of the period is Ahmad Pasha. He surpassed his contemporaries in panegyrics and love poems exercising, thus, a great influence on the poets of his time. Next to him in this field is Najati.

A certain number of chronicles in verse belong to this period.

Prose also developed considerably. In this connection we may mention the anonymous commentary on the Qur'an, Jawahir al-Asdaf (Gems of Mothers of Pearls), and the more popular book Qirq Vezir Hikayalari (The Tales of the Forty Viziers).

But it was mainly artistic prose that was cultivated, its most brilliant representative being Sinan Pasha with his Tadaru' Namah (Book of Supplication). His style is artistically elaborated, yet natural and sincere. Other representatives of artistic prose are Sari Kamal, Ahi, Masihi, and Ja'far Chalabi.

As a reaction to this ornate language the first representative of the turki-i basit (simple Turkish), Wisali who wrote in 'arud metres but used exclusively Turkish words deserves to be noted. However, only one couplet of his has come to us.

The writing of history in prose also began to develop. We have many anonymous specimens of Ottoman history. They show us that there existed in the ninth-15th century among the people and especially among the soldiers chronicles which were almost of the nature of epics. The historical works of 'Ashiq Pashazadah, Oruch Beg, and others do not differ much in point of style from these anonymous chronicles. The works of Tursan Beg, Bayati, and some others, on the other hand, were written rather with the object of displaying a particular style and an extensive literary ability.

A fine specimen of unaffected prose of this period is the treatise by Deli Lutfi, which is one of the oldest works of humour in Turkish literature.⁹

Tenth/16th Century

In the tenth/16th century the apogee of Ottoman political power is also reflected in the sphere of literature. Literary activity flourished not only in Istanbul, but also in Baghdad, Diyar-i Bakr, Qunyah, Kastamonu, Bursa, Edirne, Yenije-u Vardar, and Uskup. Philological commentaries and

lexicographical and grammatical works were produced. Books without number were translated from Arabic and Persian.

The greatest figures in poetry in chronological order are: Dhati, Khayali, Fuduli, and Baqi. Dhati wrote a large number of works in poetry and prose which are unequal in merit. His imagination and new ideas made him very popular. Khayali surpasses Dhati as a poet. His Diwan contains all his works. His most original poems are his love poems. Fuduli must be regarded as the greatest lyrical poet of Turkish literature. Although he used the dialect of Adharbaijan, he exercised such an influence in Anatolia that literary historians regard him belonging to the realm of Anatolian literature.

His love poems and love romance Laila wa Majnun have secured him a special place in literary history. Love in his works is never entirely profane in character, thanks to mystic inspiration. No other poet except Nawa'i has acquired a like reputation throughout the whole Turkish world. He exercised an influence even on the musician poets of the lover classes. Baqi was undoubtedly the most reputed poet of his time, has fame stretching as far as India. In the expression of sentiment he is below Fuduli, but the musical charm and faultless ease of his poems have given him the reputation of an inimitable master of classicism. His elegy on the death of Sulaiman the Magnificent is a masterpiece of deep sentiment and grief.

At this period Anatolian Turkish poetry attained the highest point in artistic elaboration and rhetoric. It is true that this was in the main an imitation of Persian poetry. But the Anatolian Turkish poets imitated rather the Indo-Persian poetry and went even further in fineness and abstraction. In the next centuries we see this refinement perfected on its own lines.

Poets belonging to different dervish orders composed didactic works, mystic poems and collections of legends of saints, along with translations of Arabic and Persian mystical works.

Prose in this century assumed a heavier and more artificial form. Outdoing the Persian models, the simplest ideas were expressed by the most complicated images to the detriment of the subject. This lack of taste is found in the greatest stylists of the period: Lami'i, Kamal Pashazadah, Jalalzadah, Faridun Beg, 'Azmi, Qinalizadah, Khuwaja Sa'd al-Din and others. This tendency to artificiality had a much more disastrous effect on prose than on poetry. In very long works, however, it was only the preface that was written in this turgid and clumsy style.

Many literary, historical, religious or moralizing works of the period were in fact written in a simpler language. The same applies to official correspondence and other State documents. In religious works intended for the people every endeavour was made to write as simply as possible. The examples which we possess of the prose of Fuduli and Baqi show an elegant and relatively simple language.

As a reaction to the ornate language, the movement called turki-i basit (simple Turkish) has its second well-known exponent in Nazmi of Edirne whose Diwan, though, again, in 'arud verse, contains only Turkish words. But he has no artistic abilities.

In the field of historical works great progress was made. Besides rhymed chronicles, we find historical works in prose in continuation of the Saljuq

tradition. A number of historical works were written in verse. With the exception of the Ottoman history by Hadidi they always deal with a single event or the victories of a single emperor or commander. General histories were composed by ibn Kamal, Jalalzadah, Mustafa Chalabi, Muhi al-Din Jamali, Lutfi Pasha, Khuwaja Sa'd al-Din, and 'Ali. Some of these works are the sources for our knowledge of the social history of this period.

Among historical works those which deal with literary history occupy an important place. The first Ottoman collection of biographies of poets was produced by Shahi Beg on the model of Nawa'i's work. This was followed by the works of Latifi, 'Ashiq Chalabi, 'Ahdi, and Hassan Chalabi. 'Ali also gives important notices of poets in his historical work.

It is in this century that there appeared geographical works and accounts of travels. Some are mere translations. The celebrated Bahriyyan (Maritime Work) of Piri Ra'is and Muhit (Ocean) and Mir'at al-Mamalik (Mirror of lands) of Saidi 'Ali Ra'is are the best works of this type. We have further records of voyages both in verse and in prose.

The first grammar of Anatolian Turkish, planned on the model of Arabic grammars, by Qadri of Pergamon, was also written in this century.

Alongside classical literature we find popular literature increasing in every form. Wondering musician-poets were to be found wherever people congregated, and love songs, heroic tales, elegies, and folk-songs were recited.¹⁰

11th/17th Century

In the 11th/17th century knowledge of the Ottoman literary language spread among the Muslim lower classes generally and also through districts to the non-Turksih population or Turks of speaking a non-Ottoman Turkish dialect. The influence of Turkish literature and culture is found as early as the tenth/16th century in the use of Arabic script by the Muslim Hungarians and Croats. There are also found dictionaries of Turkish-Serbian, Turkish-Bosaniak, and Turco-Greek in verse. Istanbul was always the centre to which men of letters and learning flocked from all parts of the Ottoman Empire and from beyond its frontiers.

The classical Turkish poetry of the 11th/17th century was in no respect below the level of the Persian models. The Turkish poets by this time were working on original themes, though the influence of the Persian and Indo-Persian poets was still felt.

Naf'i may be regarded as the greatest master of eulogies (qusidahs), on account of the power of his imagination, the richness of his language, and the elevation and harmony of his style. His love poems and his satires (hajwiyyat), on the other hand, are less successful.

Another very important classical poet was Nabi who is renowned for his refined didactical poems and descriptions. His verses are still quoted as proverbs. He was also the one who protested against artificial language, saying, "The ghazal book is a dictionary."

The greatest figure in romance poems (mathnawi) is Nav'izada 'Ata'i who takes his subjects from the life of his time.

The number of religious and mystical works, lives of saints, and didactic works connected with different orders is very great in this century. Poetical forms were often used for them.

Literary prose follows the same lines as in the preceding century. The great stylists like Vaisi, Narkisi Oqchizadah, and others carried affectation of language to still greater lengths. Yet works which were in their days considered to have no literary value are now being greatly appreciated.

As an encyclopaedist, Katib Chalabi's name must be mentioned.

Histories in this century also took the first place among prose works. There are several which have the character of semi-official chronicles. Mainly, though they are translations of general histories of Islam, there are also original works on the same subject, and general and special works and monographs on Ottoman history. The best historians are Katib Chalabi, Pachavi, Na'ima, and Qochi Beg. The verse chronicles are much below the level of those of the tenth/16th century. The most notable are those of Riyadi and Qafzadh Fa'idi.

In the field of geography the most important works are those of Katib Chalabi and Abu Bakr Dimashqi. They use European as well as Muslim sources. The Sayathatnamah (Voyage Book) of Avliya Chalabi is important as history of all aspect of social life.

The great popularity of the literature of the people continued in this century in all classes of society. The musician-poets became very numerous. We find them in the military classes and in the religious orders. The most important of them are Karaja Oghlan Gavhari and 'Ashiq 'Umar. The influence of this popular literature is felt even among the upper classes.¹¹

12th/18th Century

Literature and culture continued in the 12th/18th century to follow the same lines as in the preceding centuries. There was a fast output in prose and poetry, while the cultural links with Persia and Transoxiana continued. But the tendency to a more individual development gained in strength. Endeavour was made to simplify the language.

Among the poets Nadim in particular acquired a great reputation. By his original themes, rich imagination, sparkling wit, and the harmonious language he surpassed his predecessors and contemporaries. He was the poet who brought much local colour to Turkish literature. He was famous with his sharqis, another verse-form peculiar to Turkish classical poetry and foreign to Persian literature. One of his poems he composed in the Turkish syllabic metre and the national form turku.

Among the great poets of this century special mention must be made of Raghıb Pasha, the last great poet of the classical period.

The poets of this century practiced all forms of poetry, but special attention was devoted to genres characteristic of an epoch of decadence. On the other hand, true religious inspiration still contained. The last masterpiece of romantic poetry was Sheikh Ghalib's Husn-o 'Ishq (Beauty and Love) with its mystical inspiration and very fine style.

Literary prose tended to become gradually simpler, although imitations of the old artificial style were still found. A well-known stylist, 'Uthmanzadah Ta'ib openly denounced exaggerated artificiality in prose.

Historical works occupied the first place, but they could not be compared to those of the preceding century.

The political and military decline of the Ottoman Empire stimulated the writing of a large number of memoirs investigating its causes. The most remarkable of these is that of Qoja Segban Bashi.

From the point of view of geography we may note a number of important descriptions by ambassadors of which that of France by Yirmi Sekiz Muhammad Chalabi is a typical and very interesting example. We may also notice a number of translations of European works on geography.

The writings celebrating the splendid festivals held by the Sultans are important sources for sociological research.

The collections of biographies of poets are even more numerous than in the preceding century.

Popular literature continued to enjoy the same popularity among all classes of society. The works of the musician poets were also well known. Taste for such literature penetrated more into the upper classes.

In this century Ibrahim Mutafarriqah inaugurated printing in Turkish script, but for several reasons printing remained confined to a very restricted sphere throughout the century and did not exercise any particular influence on intellectual and artistic life.¹²

13th/19th Century

At the beginning of the 13th/19th century Ottoman literature sank to a very low level which continued until the period of political reform. It was only natural that the old literary tradition could not disappear at one stroke.

The prose of the period before the political reforms was not of much value, although its production was not less in quantity than that of the preceding centuries. The historical work by Mutarcim 'Asim was remarkable for its style and critical analysis. He used even simpler language in his translation of Burhan-i Qafi' (The Definite Proof) and the Qamus (Lexicon). Lastly, mention must be made of the celebrated poet and stylist 'Akif Pasha who, on account of several poems written in the popular metre and some works in simple prose, could be regarded as the first to have spread literary innovations.

We also had representatives of popular literature. The best known musician-poets were Dertli, Dhihni and Amrah.

B. Development of Turkish Grammar and Lexicography

1. Turkish is an agglutinative language. The root which is either verbal or nominal and which (except in the case of certain pronouns) is never inflected always appears at the beginning of the word. Verbal forms are built from the verb-stem, which may be a simple root or a root modified by formative suffixes. The verb-stem is followed by suffixes indicating aspect and tense ("voice" and "negation" being shown by aspect suffixes), to produce the tense-stem which, without further suffixation, expresses the third person singular; other persons are indicated by the addition of a personal suffix. The resultant word is a unit as regards stress, intonation, and sound harmony, i.e. assimilation of sounds tending to conform the sounds to

the suffixes to the root in general. Phonetic changes in the root or suffixes do not imply semantic modifications.

Nominal forms again are built out of the noun-stem, which may be a simple root or a root modified by formative suffixes.

Prefixes and infixes do not exist in Turkish.

The syntax of the language is based essentially on the following principle. The governing parts of grammatical statement or of a group of statements follow the parts governed. Hence the principal part of the statement or of a group of statements, i.e. the finite verb or predicate, is usually placed at the end, the completed parts follow the complement, the qualified elements (nominal or verbal) are put after their qualifiers (adjectival or adverbial), and the principal statement follows the subordinate.

Turkish in its original form did not include conjunctions. The only subordinate clause which is attested from the earliest documents onwards is the conditional.

The characteristics of the Turkish language outlined above are to be found in the earliest surviving Turkish documents, which date from the first/seventh century.

2. This “pure” language, however, underwent a considerable change when pagan Turks came into contact with the Far Eastern civilizations and religions. The Turkish literary output of the period before the adoption of Islam was mainly translations of the scriptures of various religions. Such translations of sacred texts had to be as literal as possible. Of course, it is no wonder that under the influence of the non-Turkish structures of the languages so translated, this literary dialect, while preserving its native participial and gerundial constructions, acquired new types of sub-ordinate clauses, partly with defective constructions and developed conjunctions formed from Turkish roots. In the field of vocabulary also we find technical expressions, borrowed from the more developed languages of the Far East. This does not, however, mean that such borrowings were numerous. On the contrary, a great number of expressions were mere Turkish translations from these languages.

3. As to linguistic peculiarities of the first Islamic literary dialect in Central Asia, it differed but slightly from Old Turkish. Religious terms markedly connected with the Far Eastern religious were no more to be found. In their place, we find Islamic terminology. But this latter was not as widespread as one would expect or find in later literary works. Instead Far Eastern terms or Turkish calques from them were still common. The development in the direction of one analytical sentence structure was less pronounced. Though sub-ordinate clauses of the Indo-European and Semitic types began to develop in general, the Turkish sentence with its participial and gerundial forms still prevailed. Nevertheless, new conjunctions were created out of Turkish words or borrowed from Arabic and Persian, and these to a great extent encouraged the development of new Turkish subordinate clauses.

On the other hand, popular words of the Karakhanidian period show very little foreign influence. Both in syntax and lexicography, this influence was

restricted to the minimum. In this respect the popular literary products of the earliest Turkish Islamic literature resembled the runic inscriptions.

4. In Khwarizmain period, Arabic and Persian exercised an increasing influence on Turkish syntax. Both in verse and in prose, the basically fixed Turkish word-order became more flexible and the rich stock of terminations that henceforth developed in the language prevented ambiguity and gave it greater clarity. The borrowings from the two main Islamic culture languages, Arabic and Persian, increased. Vocabulary was further enriched by the use of Arabic and Persian loan-words, though the Far Eastern loan-words were still common, and inversion, particularly in verse, was now used to a greater extent. Until the ninth/15th century, Anatolian Turkish also reveals the same characteristics.

5. During the classical period of Ottoman literature, the syntactical influence of Persian in the construction of sentences did not increase. Rather, it diminished in the course of time.

The old Turkish type of sentence with only a single finite verb, but using many participial and gerundial forms was particularly in use in Ottoman prose. This made the formation of very long sentences possible. Inversion, however, particularly in verse, was greatly practiced. Persian and Arabic loan words and grammatical forms became more numerous and Far Eastern loan words were totally forgotten.

6. In modern Turkish, the syntactical influence of Persian in sentence constructions has left few traces. On the other hand, modern writers have drawn fully on the resources of popular speech; the language has thus been greatly enriched and rendered much more expressive, thanks to the harmonious combination of the synthetic structure of the old language with the freer construction and more vivid turns of expression of everyday spoken Turkish.

New constructions of sub-ordinate clauses with conditional or temporal force, formed from a finite verb followed by the interrogative ending, have become meaningless.

In the Turkish vocabulary, Persian and Arabic loan words have become much less numerous, giving place to Turkish words, some of which have even been invented. Loan words from the European languages, mainly at first from Italian then from French, are to be noticed.

7. Thus, we see that in the process of evolution, owing partly at least to the influence of languages of other structural types, both Eastern and Western, Turkish has developed conjunctions, other types of sub-ordinate clauses, and a freer word order in the sentence.

Chapter 55: Architecture

A. The First Three Centuries of Muslim Architecture

Arabia, at the rise of Islam, does not appear to have possessed anything worthy of the name of architecture. Only a small proportion of the population was settled and lived in dwellings which were scarcely more than hovels. Those who lived in mud-brick houses were called ahl al-madar, and the Bedouin, from their tents of camel's hair cloth, ahl al-wabar.

The sanctuary at Mecca, at the time of Prophet Muhammad, merely consisted of a small roofless enclosure, oblong in shape, formed by four walls a little higher than a man, built of rough stones laid dry. Within this enclosure was the sacred well of Zamzam.

When Prophet Muhammad, as a result of the hostility of the unbelieving Meccans, migrated to Medina, he built a house for himself and his family. It consisted of an enclosure about 100 cubits square of mud-bricks, with a portico on the south side made of palm trunks used as columns to support a roof of palm leaves and mud. Against the outer side of the east wall were built small huts (hujarat) for the Prophet's wives, all opening into the courtyard. We have the description of these huts, preserved by ibn Sa'd,¹ on the authority of a man named 'Abd Allah ibn Yazid who saw them just before they were demolished by order of al-Walid. "There were four houses of mud-bricks, with apartments partitioned off by palm branches, and five houses made of palm branches plastered with mud and not divided into rooms. Over the doors were curtains of black hair-cloth. Each curtain measured 3 x 3 cubits. One could reach the roof with the hand." Such was the house of the leader of the community.

The Dome of the Rock of Jerusalem, the oldest existing monument of Muslim architecture, was built by the Caliph 'Abd al-Malik and completed in 72/691. It was an annular building and consisted of a wooden dome, set on a high drum, pierced by 16 windows and resting on four piers and 12 columns, placed in a circle. This circle of supports are placed in the centre of a large octagon, averaging about 20.59 m a side, formed by eight walls, each pierced by five windows in their upper half. There was a door on each of the four sides of the octagon.

The space between the circle and the octagon being too great to be conveniently spanned by single beams, an intermediate octagon was placed between the two to provide the necessary support for the roof. The two concentric ambulatories thus formed were intended for the performance of the tawf. The piers and columns were so planned that, instead of concealing one another, they permit from almost any position, a view of right across the building. A twist of about two and half degrees was given to the central ring of supports, with the result that an observer entering any door can see not only the central column in front of him but also the column on the far side.

The exterior was always panelled with marble for half its height, as it is today, but the upper part was originally covered with glass mosaic (fusafisa-) like the inner arcades. This was replaced by the present coating of faience by Sultan Sulaiman in 959/1552. The harmony of its proportions and the richness of its decoration make the Dome of the Rock one of the most beautiful buildings in the world.

The Great Mosque of Damascus

‘Abd al-Malik died in 86/705 and was succeeded by his son al-Walid, who immediately began the construction of the Great Mosque of Damascus. A curious situation had prevailed here since the conquest. A great sanctuary of a Syrian god existed here, consisting of a temenos, or sacred enclosure, measuring 100 m from the north to south and 150 m from the east to the west, set in an outer enclosure over 300 m square. Within the temenos was a temple.

In the fourth century Christianity became the State religion and Theodosius (379 - 395 A.D.) converted the temple into a church.² After the Arab conquest, the temenos was divided between Muslims and Christians. Ibn Shakir says that they both “entered by the same doorway, placed on the south side where is now the great mihrab; then the Christians turned to the west towards their church (i.e. the converted temple), and the Muslims to the right to reach their mosque, presumably under the southern colonnade of the temenos where is now the “mihrab of the Companions of the Prophet.”

As for the corner towers, ibn al-Faqih (p. 108) says, “The minarets (mi’dhanah) which are in the Damascus Mosque were originally watch towers in the Greek days. . . . When al-Walid turned the whole area into a mosque, he left these in their old condition.” Mas’udi³ says, “Then came Christianity and it became a church, then came Islam and it became a mosque. Al-Walid built it solidly and the sawami‘ (the four corner towers) were not changed. They serve for the call to prayers to the present day.” This state of affairs lasted until al-Walid, after bargaining with the Christians, demolished everything except the outer walls and the corner towers and built the present mosque.

The mosque had a court (sahn), an oblong rectangle, surrounded on three sides by a portico. On the South side was the sanctuary nearly 136 m in length and a litter over 37 m in depth, formed by three arcades running parallel to the south wall. A broad transept, running from north to south, cut these arcades into two nearly equally halves, each half consisting of 11 arches. Above these arcades was a second tier of small arches, there being two of these small arches to every one of the main arches below. The arched openings were filled with stucco lattices, and must be regarded as windows. The interior was adequately lit, even when the doors of the main arches next to the sahn were closed.

The decoration consisted of marble panelling (some parts of the original panelling exist next to the east entrance) above which ran a golden karmah or vine-scroll frieze, and above that was glass mosaic (fusaifisa) right up to the ceiling. A considerable amount has survived the three fires of 462/1069, 804/1401, and 1311/1893, and may still be seen under the west portico (over 34 m in length and nearly seven metres high), where the famous panorama of the Barada (the river of Damascus) is in full view. When intact the surface of the fusaifisa must have been greater than in any building in existence! The Great Mosque of Damascus was rightly regarded by medieval Muslims as one of the Seven Wonders of the World. Al-Walid also enlarged and rebuilt the great Mosque of Medina in 89/708 wherein the concave mihrab appeared for the first time.

Another building due to al-Walid was the audience hall and hammam, known today as Qusair 'Amrah, in Transjordan. It consists of an audience hall about ten metres square, with two slightly pointed transverse arches supporting three tunnel-vaults. There is a vaulted recess on the side opposite the entrance, with a small vaulted room on either side of it. A door on the east side gives access to the hammam, which consists of three small rooms successively covered by a tunnel vault, a cross vault, and a dome. The latter was the calidarium, or hot chamber, and under the floor are hypocausts exactly as in a Roman bath.

But the most remarkable of all are the paintings which cover the walls, mostly scenes from daily life, a hunting scene, and figures symbolizing history, poetry, and philosophy with the words in Greek above their heads. The dome of the calidarium was painted to represent the vault of heaven, with the Great Bear, the Little Bear, the signs of the Zodiac, etc. But most important of all was the painting of the enemies of Islam defeated by the Umayyads, with their names written above them in Greek and Arabic: Aaisar (the Byzantine Emperor), Rodorik (the Visigothic King of Spain), Chosroes, Negus (the King of Abyssinia), and two more names which have been obliterated.

Painting, contrary to the popular idea, is not forbidden by any passage in the Qur'an, and hostility to it took proper theological form only towards the end of the second/eighth century.⁴

To sum up, the monuments of Umayyad architecture are really magnificent structures of cut stone with arcades resting on marble columns, splendidly decorated internally with marble panelling and mosaic (fusaiifisa). The mosques are nearly always covered with a gable roof. The minarets were tall, square towers, derived from the church towers of pre-Muslim Syria, and the triple aisled sanctuaries were due to the same influence. Umayyad monuments exhibit a mixture of influences, Syria occupying first place and Persian second, while Egyptian influence is definitely demonstrable at the end of this period at Mushatta.

Umayyad architecture employed the following devices: the semi-circular, the horse-shoe and the pointed arch, flat arches or lintels with a semi-circular relieving arch above, joggled voussoirs, tunnel-vaults in stone and brick, wooden domes, and stone domes on true spherical-triangle pendentives. The squinch does not appear to have been employed. But we know from the descriptions of early authors that a type of mosque which prevailed in Iraq had walls of bricks (sometimes of mud-bricks) and its flat timber roof rested directly on the columns without the intermediary of arches. Here we have a direct link between the ancient Persian audience-hall (apadana) and the flat-roofed portico (talar) of more recent Persian palaces.

At about this time the Aqsa Mosque at Jerusalem was partly rebuilt by the Caliph al-Mahdi. Recent research enables us to affirm that it then consisted of a central aisle, 11.50 m wide, with seven aisles to the right and seven to the left, each about 6.15 metres in width, all covered by gable roofs and all perpendicular to the qiblah wall. There was a great wooden dome at the end of the central aisle. On the north side was a large central door with

seven smaller ones right and left, and 11 “unornamented” ones on the eastern side.

This mosque had a great influence on the Great Mosque of Cordova built in 170/786 - 787 by ‘Abd al-Rahman I, the last survivor of the Umayyad family. It was added to on three occasions but this earliest part still exists, as at Jerusalem, the aisles, of which there are 11, all run perpendicular to the back wall, they are all covered by parallel gable roofs, and the central one is wider than the rest. The influence of Syria in Spain at this time is not surprising, for Spain was full of Syrian refugees.

Another building of this period of great importance in the history of architecture is the Cistern of Ramlah in Palestine; it consists of a subterranean excavation eight metres deep divided into six aisles by five arcades of four arches each, all of which are pointed and appear to be struck from two centres, varying from one-seventh to one-fifth in span apart. And there can be no doubt about the date, for on the plaster of the vault is a Kufic inscription of Dhu al-Hijjah 172/May 789. It is, therefore, centuries earlier than the earliest pointed arches in Europe.

The Arabs first set foot on the North African soil as conquerors in 19/640 under the courageous command of ‘Amr ibn al-‘As. The whole of Egypt was occupied within less than two years and ibn al-‘As made the military camp at al-Fustat, a site south of modern Cairo. Al-Fustat continued to be the capital of Egypt until the Fatimids in 360/969 founded Cairo. ‘Amr constructed a simple mosque at al-Fustat, the first in Africa, in 20 - 21/641 - 642. Enlarged and improved under the Umayyads, this structure, in the course of time, grew into the celebrated mosque of al-Fustat.

The mosque of ‘Amr was first enlarged at the order of Caliph Mu‘awiyah in 53/6735 and four minarets were introduced in any Muslim structure.

The next major enlargement of this mosque took place during the reign of Caliph al-Mamun in 212/827 at the hands of ‘Abd Allah ibn Tahir, Governor of Egypt. Since then it has been repaired and rebuilt more than once.

The mosque of ‘Amr is now a big enclosure. The side walls were each pierced by 22 windows lighting the 22 aisles. There were three mihrubs and seven arcades in the sanctuary, each arcade consisted on 19 arches on 20 columns. The arcades were all braced with decorated tie-beams.

We must now speak of the great mosque of Susa on the gulf of Gabes which the inscription of its wall tells, was built by Abu al-‘Abbas ibn al-Aghlab in 236/850 - 51. It consists of a perfectly regular rectangle measuring 49.39 m x 57.16 m internally, and irregular annexes to east and west. The sahn, measuring roughly 41 m x 22.25 m is surrounded by low arcades of slightly horse-shoe form, resting on squat T-shaped piers. There are 11 arches to the north and south and six to the east and west. These arches are of horse-shoe form, the maximum span of each being equal to the space between the piers below. The sanctuary consists of 13 aisles, formed by 12 arcades of six arches running from the north to the south, each divided into six bays by other arcades running from the east to the west.

Internally, it is perfectly plain except for a splay-face moulding, immediately above which is a fine inscription frieze in simple undecorated

Kufic, the maximum height of the characters being 28 m. The frieze in which they are carved curves forward slightly to compensate for the fore-shortening and thus help the observer at ground level. This is the earliest known example of this treatment which passed into Egypt with the Fatimids and appears in the Mosque of al-Hakim, 380 - 403/990-1013.

The Great Mosque of Samarra was built by the Caliph al-Mutawakkil; the work began in 234/848 - 49 and finished in Ramadan 237/February - March 852. It was the largest mosque ever built, for its outer walls form an immense rectangle of kiln-baked bricks measuring roughly 240 m deep internally by 156 m wide (proportion approximately as 3:2); its area, therefore, is nearly 38,000 metres square. Only the enclosing walls have been preserved. The mosque proper as surrounded by an outer enclosure, or ziyadah, on the east, north, and west sides and air photographs show that the great rectangle thus formed stood in a still greater enclosure measuring 376 m x 444 m. The minaret, the famous Malwiyah, stand free at a distance of 27 ½ m from the north wall of the mosque.

There is a socle three metres high on which rests a spiral tower with a ramp about 2.30 m wide, which winds round in a counter-clockwise direction until it has made five complete turns. The rise for each turn is 6.10 m but as the length of each turn is less than the previous one it follows that the slope inevitably becomes steeper and steeper. At the summit of this spiral part is a cylindrical storey, decorated with eight recesses, each set in a shallow frame. The southern niche frames a doorway at which the ramp ends; it opens onto a steep staircase, at first straight then spiral, leading to the top platform, which is 50 metres above the socle. From eight holes to be seen here Herzfeld concluded that there was probably a little pavilion on wooden columns. A few years later, between 246 - 247/860 - 861, another immense mosque was built by the same Caliph at Abu Dulaf to the north of Samarra.

Ten years later, important works were carried out in the Great Mosque of Qairawan by Abu Ibrahim Ahmad, who reduced the width of the central aisles by about 1.20 metres by constructing two new arcades in contact with the old ones. The arches of these arcades are pointed horse-shoe arches instead of round horse-shoe arches like those with which they are in contact. He also built three free-standing arches and one wall-arch of the same type to carry a fluted dome in front of the mihrab. They rise to a height of 9.15 metres and the square thus formed is terminated above the cornice, its top edge being 10.83 meters from the ground. On it rests the octagonal zone of transition, 2.15 metres in height, which is formed by eight semi-circular arches springing from colonnetes resting on little corbels inserted in the cornice just mentioned.

The dome, which is 5.80 metres in diameter, has 24 ribs, each springing from a little corbel, between the ribs are concave segments, 30 cm deep at the base and diminishing to nothing at the apex. The whole composition is charming. Externally, the dome resembles a cantaloupe melon, with 25 convex ribs (corresponding to the 24 concave segments) which taper to nothing at the apex. Abu Ibrahim's work was carried out in 248/862. He also lined the mihrab with a series of very beautiful carved marble panels

assembled in four tiers of seven panels each, the total height being 2.70 m. He also decorated the face of the mihrab and the wall surrounding it with lustre tiles about 21 cm square. The marble panels and the tiles were imported by him from Iraq and the latter constitute the oldest examples of lustre pottery of certain date.

It was during the reign of Ahmad ibn Tulun (254 - 270/868 - 884), the first Muslim sovereign of independent Egypt, which Muslim architecture properly developed in the Nile Valley. He was son of a Turkish slave and was born and brought up in Samarra. He proved to be a great administrator and a great builder. Al-Qata'i, the new quarter of al-Fustat, was adorned as there was a vast ground in front of the palace where polo matches took place. The palace had nine gates and one of them was called Bab al-Salat (Gate of Prayer). He also built a hospital at an expense of 60,000 dinars.

But his greatest work, which still stands, is his famous mosque; it cost him 120,000 dinars.⁶ It exhibits strong influence at the Samarra school as ibn Tulkun himself came from Samarra and his architects and craftsmen too were mostly Iraqis.⁷ This Iraqi impact is clearly visible in the piers of the mosque and in its ornamental work in wood and stucco.

The mosque of ibn Tulun is built on the outcrop of a rock and impresses the visitor by its great size and the noble simplicity of its plan. It consists of a sahn 302 square feet surrounded by riwaqs, five aisles deep. There are 13 pointed arches on each side. The sanctuary is formed by five arcades 17 arches each. The arches are surrounded by a continuous band of ornament. Above runs a broad frieze of stucco rosettes each in an octagonal frame.

The varieties of designs some composed of straight lines, others triangular, and still others circular and interlacing, are extra-ordinary. The windows form one of the most beautiful features of the mosque. They are 128 in number. Their pattern is a mesh of equilateral triangles by grouping six of which we can form hexagons. The minaret, which is built of hives-stone, is almost a copy of the Malwiyah of Samarra. About 1/17th of the Qur'an is inscribed in beautiful Kufic characters on the wooden frieze round the inside of the building just below the flat timbered roof.⁸

Tulunid Egypt could also boast of a very unusual structure; it was the palace of Ahmad ibn Tulun's son, Khumarawaih (271 - 282/884 - 895). The walls of its golden hall were covered with gold and decorated with bas-reliefs of himself, his wives, and his songstresses.⁹ These life-size figures were carved in wood.

Under the 'Abbasids the Hellenistic influence of Syria was replaced by the surviving influence of Sassanian Persia, which profoundly modified the art and architecture, and this gave birth to the art of Samarra, the influence of which extended to Egypt under ibn Tulun and even Nishapur and Bahrain. In palace architecture there was a vast difference between one of the Umayyads and that of the 'Abbasids, partly due to the adoption of Persian ideas of royalty which almost deified the king; hence, elaborate throne-rooms, generally domed, for private audience, preceded by a vaulted liwan (or four radiating liwans) for public audience. The baits also were different, following the type of Qasr-i Shirin and not the Syrian type of Mushatta and Qasr al-Tuba.

The scale was immense and axial planning was a marked feature. But all are built of brick and a great part of the basest of materials - mud-brick - hidden by thick coats of stucco. A new type of pointed arch appears - the four centred arch. The earliest existing squinches in Islam date from this period. An important innovation was the introduction of lustre tiles, the earliest examples being those brought to Qairawan from Iraq in 248/862. Bands of inscription were usually made to stand out on a blue background. But the wide-spread influence of the 'Abbasid art did not extend to Spain where the Umayyad art, brought thither by Syrian refugees, was still full of life.

B. Muslim Architecture in Later Centuries

1. Muslim Architecture in North Africa

The Fatimids

When the Fatimids came to power in Egypt in 358/969, they built a new city north of al-Fustat and called it al-Qahirha (Cairo). Since then Cairo has always been the capital of Egypt. The great mosque of al-Azhar was also built almost at the same time (361/972). The original sections of al-Azhar, which still exist, are built in brick and have pointed arches. The minaret is of the heavy square type. The next Fatimid mosque, completed by al-Hakim in 403/1012, follows the al-Azhar plan and has a cupola of brickwork supported on an octagonal drum above the prayer niche. The triumph of stone over brick, initiated by al-Hakim, was not affected until the beginning of the sixth/12th century. The first appearance of corbelled niche is found in the mosque of al-Qamar (519/1125). This pillared mosque displays bold designs and austere Kufic inscriptions.

The grandeur of Fatimid architecture may well be imagined from the testimony of the massive gates of which three are extant in Cairo: Bab Zawilah, Bab al-Nasr, and Bab al-Futuh.¹⁰

The Mamluks

While the Tulunid and Fatimid architecture in Egypt was inspired by Iraq and Iran respectively, the Mamluk monuments were influenced by the Ayyubi School of Syria. The Mamluks produced some of the most exquisite structures. Made of fine and durable stone, these monuments are distinguished for their strength and solidity. Their simple decorative motif assumes infinite grace.

Mamluk monuments may be roughly divided into three categories: the madrasah-mosque monuments, the citadels, and the hospitals, besides other public works like canals and aqueducts. The madrasah type was first introduced in Egypt by Sultan Salah al-Din Ayyubi of the Crusade fame. Although none of these institutions exist today, their impact may easily be noticed in the collegiate mosque of Sultan al-Hassan (748 - 63/1347 - 61).

One of the early monuments of the Mamluk period is the Great Mosque of Baibars (658 - 676/1260 - 1277). It was built in 668/1269. Napoleon used it as a fort when he was in Egypt. Al-Malik al-Mansur Saif al-Din Qalawun (678 - 689/1279 - 1290), a great builder, erected a hospital connected with a madrasah and a mausoleum with its remarkable arabesque tracery and fine

marble mosaic. This hospital, known as al-Maristan al-Mansuri, was completed with the mosque and the attached school in 683/1284. It had special wards for segregating patients of various diseases and contained laboratories, dispensaries, baths, kitchens and store-rooms.¹¹

His son and successor al-Nasir (692 - 740/1293 - 1340) surpassed him in the construction of public works. He dug a canal connecting Alexandria with the Nile employing 100, 000 men, built an aqueduct connecting his far-famed citadel al-Qasar al-Ablaq (the place of varied colour) at Cairo with the river, founded 30 mosques at various places in his kingdom, and provided for the public use drinking fountains (sabils), baths, and schools. Inside his citadel he built a mosque the material for which was brought from 'Akka.

Another noteworthy builder among the Mamluks was al-Nasir's son, Sultan Hassan, whose collegiate mosque is the most splendid example of Mamluk architecture. It consists of a square sahn (central court) which is flanked by four liwans (halls) forming the four arms of a cross. Perhaps these unique cruciforms were each meant for the four major schools of Muslim theology. Behind the qiblah wall of this mosque is the mausoleum of Sultan Hassan which was built in 767/1363. It is surmounted by a large dome made of bricks. The pendentives are in wood. In its general appearance it seems to have been inspired by the Sultaniyyah tomb of Sultan Khuda Bandah (d. 706/1306).

During the Mamluk period the use of brick was abandoned in minaret construction in favour of stone. The cruciform plan of school-mosque structure was perfected. Domes, renowned for their lightness, beauty of outline, and excessively rich decoration, were constructed. Stones of different colours in alternate courses (ablaq) were utilized for striped masonry and decorations. Geometrical arabesques and Kufic letterings were also profusely used.

Although the last hundred years of the Mamluk rule are a period of decline, several impressive monuments of that period have escaped the ravages of time and turmoil. For instance, the mosque and mausoleum of Barquq (785 - 800/383 - 1398), the Mosque of Qa'it Bay (873 - 900/1468 - 1495) and the mosque of al-Ghauri (906 - 922/1500 - 1516). The Mosque of Qa'it Bay consists of a mosque proper, a tomb, a fountain, and a school. It is made of red and white stone and the dome is decorated with a charming network of foliage and rosette. Elaborate arabesque ornamentation does not seem to have affected its traditional vigour and virile elegance.

Qairawin

During the reign of Caliph Mu'awiyah, his famous general, 'Uqbah ibn Nafi' invaded the Magrib (the land west of Egypt) and founded the famous military city of al-Qairawan (49/670) south of Tunis. 'Uqbah built the mosque and his headquarters in the centre and grouped dwellings around them just as it had been done at other military towns of al-Kufah, Basrah, and al-Fustat.¹² The famous mosque of Qairawan, the fourth most sacred Muslim sanctuary in the world, was built several times by the successors of 'Uqbah and finally by the Aghlabid ruler, Ziadat Allah I (202 - 223/817 - 838).

The Qairawan mosque is a big oblong enclosure. The sahn, trapezoidal in shape is entirely paved with marble. The arcades on the north side rest on columns, but the others rest on rectangular piers with two friezes with standing columns attached to their front face. The sanctuary, like the Cordova mosque sanctuary, is a hall of columns. It is divided into 17 aisles by 16 arcades. Each of these arcades consists of seven arches. They are all of the round horse-shoe type. The mihrab as well as the surrounding structure from top to bottom is constructed of white marble covered with carvings. Part of this decoration consists of inscriptions; the rest forms arabesques of various patterns.

Round the mihrab are exquisite columns, also made of marble. There is a fine pair of orange-red marble columns situated in front of the mihrab which is actually a recess, horse-shoe in plan. It is lined with a series of marble panels, 28 in number. The semi-dome has a wooden lining covered with a coating to which is applied the painted decoration consisting of vine scrolls forming loops, filled in most cases by a five-lobed vine leaf and a bunch of grapes.

The face of the mihrab is decorated with lustre tiles, 139 in number.

At the northern end of the sahn stands the famous minaret in great prominence on a square base. It has three storeys all squarish or rectangular. At the top is a dome. The minaret is made of bricks. This is the oldest minaret on the African soil and is quite different from the spiral malwiyahs of the mosques of Samarra and the mosque of ibn Tulun.

In this region of al-Maghrrib is found perhaps the earliest monument of Muslim military architecture. It is known as Qal'ah Bani Hammad. This citadel was built by Hammad bin Yusuf al-Barbari in the province of Constantine (Algeria) in 370/980. It contains a grand mosque, a reservoir, a palace, and some other constructions that were probably used for administrative purposes. The mosque contains a square minaret in the style of Qairawan but, unlike Qairwan, there are no corridors. The citadel is in ruins now.

2. Muslim Architecture in Spain

Muslim architecture in Spain is considered a great marvel of aesthetic ingenuity. The magnificent mosque and palaces, gardens and citadels, fountains and aqueducts, public baths and private dwellings that 'Abd al-Rahman I (139 - 172/756 - 788) and his successors built at Cordova, Seville, Granada, and other cities of this western most outpost of Islamic culture, were unparalleled in the entire civilized world.

Spain was conquered by the Arab generals of the Umayyad Caliphs between 93/711 and 527/1132. The capital of the Spanish province of the Empire was Cordova. Soon Arab settlements, especially Syrian, sprang up everywhere. It was these Syrians whom the Governors of Cordova employed as artisans and architects for new constructions,¹³ and "the city was adorned with numerous beautiful structures."¹⁴ It is, therefore, natural that Muslim architecture in Spain mostly exhibits Syrian features.

But a systematic embellishment of Spanish towns, with exquisite structures, actually started when 'Abd al-Rahman I found the independent

Umayyad Kingdom of Spain. This process lasted until the death of ibn Ahmar (d. 671/1272), builder of the famous castle and palace of Alhambra.

During the reign of the Umayyad Caliphs, Cordova grew into the most magnificent city in the West. "The jewel of the world," according to a contemporary Saxon nun,¹⁵ contained 113,000 homes, 21 suburbs, 700 mosques,¹⁶ and 300 public baths.

One of the first projects of 'Abd al-Rahman I was to build an aqueduct for the supply of pure water to the capital. He also built a wall around the city and erected for himself a palace called Munyat al-Rusafah outside Cordova in imitation of the palace built by his grandfather, Caliph Hisham, in northern Syria.

'Abd al-Rahman also laid the foundation of the great mosque of Cordova in 171/786. It was finished in a year at a cost of 80,000 dinars (£40,000).¹⁷ It is the third largest mosque in the world covering an area of 26,500 square yards. It is a vast rectangle, free on all sides. Covered porticoes surround it on every side except the southern where there are 17 arches. The sanctuary is a huge hall of 19 aisles, the roof of which rests on 18 arcades. It could once be entered from the street by 13 doors. The sahn is surrounded by porticoes.

The sanctuary of this mosque is a forest of columns. They exhibit great variation of types. Some are smooth, others fluted, and a few even have spiral flutings. The arcades, too, are of a remarkable design.

The mosque underwent several improvements and enlargements at the hands of successive rulers. For instance, 'Abd al-Rahman III built a minaret 73 cubits high "measured to the highest point of the open dome pavilion. On the summit of this dome are golden and silver apples. Two were of pure gold and one of silver. Below and above each were lilies very beautifully worked out, and at the end of the span was a little golden pomegranate."¹⁸ Similarly, al-Hakam built a dome in front of the mihrab and it was decorated in gold mosaic.

Although the architectural pattern of the great mosque, with its aisles running parallel to the back wall, the horse-shoe arches, the parallel gable roofs, and the arcades around the sahn, show clear Syrian inspiration, the double tier of arcades are the most original features of the great mosque.

'Abd al-Rahman III (207 - 238/822 - 852) also erected a palatial mansion and called it al-Zahra', naming it after his wife. It stood on one of the spurs of the Sierra Morena overlooking the Guadalquivir (Wadi al-Kabir). It was started in 221/836. Marble was brought from Carthage and Numidia. Columns as well as basins, with golden statues, were imported from Constantinople. It took 10,000 workmen to build it in about 20 years. The palace had 400 rooms and apartments. The eastern hall was adorned with fountains, in which were placed golden statues of animals, set with precious stones. Water flowed through the mouth of these beautiful figures. The audience chamber was an exquisite piece of workmanship in marble and gold studded with jewels.

The seventh/13th century citadel-castle of Alhambra (the Red Palace) built by ibn Ahmar (671/1272) in Granada is another great architectural legacy of the Muslims in Spain. It is situated on a hilly terrace on the

remains of an earlier Umayyad citadel. It was enlarged and embellished by his three successors.

“This acropolis of Granada with its exquisite decoration in mosaics, stalactites and inscriptions, was conceived and constructed” on a grand scale and is without dispute “the last word in such workmanship.”¹⁹ In the words of Amir Ali, “The towers, citadels, and palaces (at Alhamabra), with their light and elegant architecture, the graceful porticos and colonnades, the domes and ceilings still glowing with tints which have lost none of their original brilliancy, the airy halls, constructed to admit the perfume of the surrounding gardens, the numberless fountains over which the owners had such perfect control, that the water could be made high or low, visible or invisible at pleasure, sometimes allowed to spout in the air, at other times to spread out in fountains, and serene azure sky, the lovely arabesques, paintings and mosaics finished with such care and accuracy as to make even the smallest apartments fascinating, and illuminated in varied shades of gold, pink, light blue and dusky purple.

The lovely dados of porcelain mosaic of various figures and colours, the beautiful Hall of Lions with its cloister of 128 slender and graceful columns, its blue and white pavement, its harmony of scarlet, azure and gold, the arabesques glowing with colour like the pattern on a cashmere shawl, its lovely marble filigree filling in the arches, its beautiful cupolas, its famous alabaster cup in the centre, the enchanting Hall of Music, where the Court sat and listened to the music of the performers in the tribunes above, the beautiful seraglio with its delicate and graceful brass lattice work and exquisite ceilings, the lovely colouring of the stalactites in the larger halls and of the conical lining in the smaller chambers,”²⁰ made this architectural monument one of the wonders of the world.

There was another royal villa within the walls of Granada. It was called al-Generaliffe (a corruption of Jami‘ah al-‘Arif). It also was considered a marvel of beauty with fountains, groves, and flowers. The gardens were terraced in the form of an amphitheatre.

The Alcazar (al-Qasr) of Seville is another notable contribution of the Muslims. It was first built by a Toledo architect for the Muwahhid Governor in 596 - 597/1199 - 1200. Of the many Alcazars in Cordova, Toledo, and other Spanish towns, the Seville Alcazar is the most renowned and the only one surviving. This gracefully decorated castle was until recently used as residence by the Spanish rulers. There is another Muwahhid monument in Seville, the Giralda tower, which was originally the minaret of the great mosque. It was erected in 580/1184 and was decorated with cusped arcading.²¹

3. Muslim Architecture in Iran

History records that the earliest mosque in Iran was Masjid al-Thaur built at Qazwin in 81/700, but the earliest Islamic monument so far discovered in Iran is the mosque known as Tariq Khanah at Damghan, halfway between Teheran and Meshed. It was built between 133/750 and 170/786. According to M. Goddard, “by the harmony of its proportions and masses, it is still one of the most magnificent buildings of Islam.” It was constructed on the vault system.

Iranian buildings throughout the Muslim period were known for their exquisite domes. These domes never arose from the Roman pendentive employed by the Byzantines but from the more primitive squinch arch which spanned the angles of the square and were converted into an octagon. The earliest Muslim dome in Persian is that of the Great Mosque at Qum, south of Teheran. It was built by Abu Sa'dain Hussain in 256/878 and was 80 feet high.

Since then three different types of domes have been built in Iran: (1) single domes, (2) true double domes, and (3) an inner dome concealed by a polyhedral tent dome or a conical roof. Single domes were popular during the Saljuq period and were direct descendants of the Sassanian domes. The most conspicuous and representative dome of the second type may be seen over the tomb of Sultan Sanjar at Merv (552/1157) while the most renowned earlier example of the third type is the Gumbad-i Qabus (398/1007).

The Gumbad-i Qabus was built by Shams al-Ma'ali 'Abd al-Hassan Qabus, the ruler of Gurgan and Tabaristan in 397/1006. This mausoleum is actually a cylindrical tower with a conical top. The inside is empty, a continuous void from the ground to the roof where it is domed with a tent like cone. The total height of the tower is a little over 167 feet. It is built of burnt brick. There are two Kufic inscriptions also, one 26 feet three inches above the ground and the other just under the corbel.

These tomb-towers hold an important place in the Saljuq architecture. They are mostly found in Adharbaijan and across the border in Qunyah. Prominent among these are Khalifah Ghazi at Amasia, the tomb-towers at Akhlat and Kaisari.

These tomb towers are dressed in stone. They are usually octagonal in shape with conical roofs. The exterior faces are decorated with arcading cut in high relief on the stones of the structure. Most of the tombs have four windows or portals. The interior is usually plain and the chamber is always covered by an inner dome of cut stone. Built flights of stairs to these chambers are rarely found. They were entered probably by means of a ladder.

The Saljuqs concentrated mainly on the construction of mosques and it was during their reign that the basis for the standard Iranian mosque was firmly laid. Its features were: at the beginning of a longitudinal axis an ivan portal leads into an open court, arcades surrounding the court are interrupted by four ivans, two on the longitudinal axis and two on the cross axis with prayer halls at the back of the arcades, the major ivan opens into a square sanctuary chamber crowned by a dome with a mihrabi in the rear wall of the chamber.

The earliest Saljuq mosque containing all these elements is the small Masjid-i Jami' at Zauara, north-east of Ispahan, which was erected in 530/1135.

During the Saljuq period vaults over the square or rectangular bays of the prayer hall of mosques display a considerable variety of types. In the earliest surviving Iranian mosques, the bays were covered by barrel vaults. This resulted in complication of construction at the corner angles and did not offer any opportunity for display of technical skill. The Saljuq builders

replaced the barrel vaults by domical type vaults. In order to enhance the decorative quality of vaults, they built groin vaults, cloister vaults, vaults on groin squinches, vaults on triangular false pendentives, domical lantern vaults, saucer domes and flat vaults. Examples of these experiments may be seen in those areas of the Jami' Masjid at Ispahan which are assigned to the Saljuqs.

Surface enrichment of the Muslim architecture in Iran was of three types: brick patterns, plaster, and mosaic faience. Decorative brick-lay appeared in pre-Saljuq work, reached its maximum effectiveness under the Saljuqs, and tended to die out in the eighth/14th century. Stucco was an important feature of decoration even in the earliest Muslim monuments and held its popularity throughout. Faience, first used by the Saljuqs on a large scale, developed considerably during the Il-Khanids and reached its zenith under the Timurids and the Safawids.

A number of Saljuq monuments contain mihrabs executed in small cut bricks. Brick end plugs were also utilized for decorative purposes but it was stucco, and to some extent sculpture in stone, that played the most important role in the exterior and interior embellishment during the Saljuq period. The arabesque and monumental inscriptions in Kufic and nasta'liq writing became an essential part of decoration. For instance, in Merv there still stand the ruins of the tomb of Sultan Sanjar (511 - 552/1117 - 1157) the last of the great Saljuqs, decorated on the inside with panels of fine arabesque and inscriptions, both Kufic and naskh in cut terra-cotta.

One of the most beautiful Kufic inscriptions of the Saljuq period is known from a ruined madrasah at Karghid in Khurasan. It contains the name of Nizam al-Mulk, the Grand Vizier of Sultan Alp Arsalan (455 - 485/1063 - 1092). The Jami' Masjid at Qazwin, built in 509/1116, and the mihrab of Imamzadh Karrar at Buzun (528/1134) exhibit the most developed Saljuq style of decoration in stucco and stone. The Jami' Masjid at Ardistan (555/1160) has three mihrabs rich in stucco decorations. Here, several systems of arabesque are intervened or placed one above the other, the heavy or baroque arabesque in high relief usually forming the background.

Stucco was used extensively in the Saljuq era not only for the decoration of mosques, but also for that of palaces and houses of nobles. Compositions consisted of hunting scenes and Court scenes. Occasionally, the relief of figures was so high and thick that it approached sculpture. These stucco reliefs were chiefly found in Rayy (Teheran) and Sawa.

Fifteen Saljuq monuments display, on the interior or the exterior, glazed tiles used in the inscriptions of patterns. Mosaic faience developed in Gumbad-i Kabud at Maraghah (593/1196) reached a stage at which strips of glazed tiles were set in a plaster ground to form an elaborate strap-work pattern, splendid calligraphic friezes of lusted faience surmounted dadoes composed of star tiles in golden brown lustre on a white ground, and mihrabs were executed in the same material, for instance, the famous mihrab of the Maidan Mosque at Kashar (623/1226).²²

Mention may be made of Malik Shah, a great Saljuq monarch (465 - 485/1072 - 1092) who made Ispahan, his capital, one of the most beautiful cities in Asia. He built the famous Jami' Mosque and for the first time

introduced the tapering fluted style of tower in Iran. The finest example of this cylindrical minaret is found in Iran. It is called Mina-a 'Ali and was built by Malik Shah. It is decorated with geometrical patterns and bands of inscriptions on glazed tiles.

Persia suffered the greatest disaster at the hands of Mongol invaders at the beginning of the seventh/13th century. Merv and Nishaput fell to Chingiz Khan in 617/1220, and within 25 years the entire country was not only occupied but cities were completely burnt, buildings were totally razed, and, at places, the entire population was slaughtered like animals with the result that very few buildings erected between the Arab invasion of Iran and the rise of Il-Khan Mongols stand today.

The Mongols ruled over Iran for about 143 years (644 - 791/1246 - 1389). Hulagu, the founder of the Mongol Empire, assumed the title of Il-Khan and made Tabriz his capital.

The first Mongol construction in Iran was an astronomical observatory built at Maraghah, the summer capital of Hulagu Khan, at the instance of his famous minister, Nasir al-Din Tusi, in 678/1279.

But it was Hulagu's successor, Arghun, who revived the great architectural tradition of Iran. He began the construction of Arghuniyyah, a splendid suburb of Tabriz. Work was also undertaken at Sultaniyyah near Qazwin and summer palaces were built at Alatagh, Mansuriyyah, and Lar.

The Golden Age of Il-Khanid architecture was, however, ushered in by Ghazan Khan, who embraced Islam and came to the throne in 694/1295. Ghazan was not only a great builder but was himself an architect. He designed and built Shenb, a suburb west of Tabriz, in 696/1297. The observatory was crowned with a cupola shaped to his own design.²³ He also built his lofty tomb at Shenb. It was 12-sided in plan and had a crypt at ground level. A great mausoleum was encircled with a golden inscription. Some 14,000 workmen were employed in its construction. Besides, there was a monastery for dervishes, a Shafi'i and Hanafi college, an academy of philosophy, a residence for the descendants of the Holy Prophet, a hospital, a palace, a library, and a splendid garden kiosk called Ardiliyyah.

The tomb was the focal point of the entire built-up area. It was surrounded by gardens which were encircled by a suburb called Ghazaniyyah. Near each of the gates of this town, which soon rivalled Tabriz, was built a caravanserai, markets, and public baths. The name of the chief architect of Ghazaniyyah was Taj al-Din 'Ali Shah.

Although Ghazaniyyah is a heap of bricks today and Ghazan's famous tomb a crumbling mound of debris, very detailed account of Ghazan's extensive construction comes to us from the works of Rashid al-Din, Wassaf, Hamd Allah Mustaufi, and Shams Kashani.

Ghazan was succeeded by his illustrious brother Olejeitu (705 - 18/1305 - 18) who embraced Islam and assumed the name of Muhammad Khuda Bandah. Olejeitu far surpassed his predecessors in architectural achievements. As a matter of fact, most renowned buildings of the Il-Khanid period belong to his reign.

Soon after he came to the throne, Olejeitu ordered work at Sultaniyyah, a site near Qazwin. Plan for this new capital was prepared by his father

Arghun but he died before it could be executed. Olejeitu built a wonderful city at Sultaniyyah. The citadel was 500 gaz on a side. It was protected by a wall and 16 towers of cut stone. The principal mosque was ornamented with marble and porcelain. There were a hospital and a college also. Surrounded by 12 smaller palaces was the royal palace, a kind of high pavilion or kiosk. The entire ensemble was set in a marble-paved court.

These palaces have since disappeared but the mausoleum of Sultan Muhammad Olejeitu Khuda Bandah still towers over the surrounding area. According to Goddard, this tomb “is certainly the finest example of known Mongol architecture, one of the most competent and typical products of Persian Muslim building and technically perhaps the most interesting.”²⁴

The second most famous monument of Il-Khanid period was the mosque in Tabriz of Taj al-Din ‘Ali Shah, Olejeitu’s minister. Only a very small section of this mosque exists today, but Mustaufi, writing in 736/1335, stated that the main ivan of this mosque was a tremendous structure. It was 30.15 metres wide, with side walls 10.40 metres thick. The height up to the vault was 25 metres. The pointed arch of the mihrab was supported on two columns of copper and the mihrab frame was embellished and pointed with gold and silver. According to ibn Battutah, the open court of the mosque was paved with marble, the walls covered with Kashani (faince decoration) and there was a square pool in the middle with fountains.

Mention must also be made of the largest the most revered shrine of Imam ‘Ali Rida at Meshed and of his sister Fatima at Qum.

During the Mongol rule, two very renowned dynasties flourished in central and southern Iran: the Atabeks and the Muzaffarids. The Atabeks were the autonomous rulers of Ars with Shiraz as their capital and the Muzaffarids controlled the entire region south of Teheran with their capital being Yazd. History records that Shiraz possessed many buildings constructed by the Atabeks but hardly any of structures exists today. The Muzaffarids seem to be more fortunate in the several very famous buildings that owe their existence to these potentates are still extant in Yazd and Kirman.

Like Iranian art in all its forms, Iranian architecture during the Il-Khanid Mongols were decorative, characterized by precision, clarity and lucidity. However, contrary to the Saljuq period, the Il-Khanid construction places a decided emphasis upon verticality. A look at the portal of Jami’ Masjid at Ispahan and its north side arches, the portal of Khanqah at Natauz, the tomb shrine at Ziarat, the niche of Bayazid’s shrine at Bistam, and Pir-i Bakram portal proves the point. Chambers too become loftier in relation to their horizontal measurements. Ivans also become narrower but higher.

The Safawid Emperor, Shah ‘Abbas the Great (995 - 1038/1587 - 1628), was one of the greatest builders Persia has ever had. He was a wonderful town planner. His achievement in this field can be seen at Ispahan, the capital, which he built anew. The scheme included the Great Maidan surrounded by vaulted bazaars, with the portal of his mosque opening in the centre of the south side, the Ala-Qapu palace on the western side, and the avenue, over two miles long, known as the Chahar Bagh.

Shah ‘Abbas also built the Jami‘ Masjid of Ispahan. It has four ivans and a domed chamber with a mihrab on the qiblah side. The south-east ivan is flanked by two halls, each with eight dome covered bays and a mihrab. The entire building including the main dome is splendidly decorated with enamelled tiles and faience mosaic.

4. Muslim Architecture in Central Asia

The starting point of Muslim architecture in Central Asia is the extant tomb in Bukhara of Sultan Isma‘il (279 - 294/892 - 907), the founder of the Samanid dynasty. It is a cubical structure with a dome. Its decoration is almost entirely of brick work. The spandrels of the central arch bear square-shaped motifs. The central hemi-spherical dome is surrounded by four small cupolas on its four corners.

Uskend in eastern Farghanah was another centre of the Samanids where four important monuments - one minar and three mausoleums - still stand. The minar is a tapering tower gradually diminishing in circumference as it reaches the top. It is cylindrical and fluted and has lost its top. It is the oldest specimen of its kind which later became very popular in Iran and Turkey. The decoration consists of tiles combined in geometrical patterns, the ground between them filled with small stucco leaves.

Merve was another great Muslim cultural centre in this region. The oldest monument in this town is a mosque built in 131 - 138/748 - 755. It is called the Hamadani Masjid in memory of Haji Yusuf of Hamadan. Still in good condition, it is used for daily prayers.

The capital of Amir Timur (737 - 807/1336 - 1404) was, however, Samarqand and he made it one of the most splendid cities in the east by building palaces, mosques, and shrines there. The style of these Timurid buildings follows Khurasanid tradition although Chinese and Turkish motifs are also visible. They included the famous mosque of Khuwaja Ahmad Uassavi constructed in 800/1397 near Samarqand. The architect of this mosque was a Persian from Ispahan. It is an enormous square structure, a cubic block from which rose two domes, one covering the mosque proper and the other the tomb of the saint. The second dome is melon shaped a characteristic of Timurid monuments. The entrance is flanked by two towers like that of a fortress, a product of Timur’s warlike mind.

Timur was greatly attached to Kish, his birth place, where he built a palace which was considered a marvel by contemporary visitors. The description given by Clavijo the Spanish ambassador, sent to the Timurid Court by King Henry III, shows that this place followed the style of ancient palaces at Nimrud and Khursabiad. Its surface was completely covered with enamelled tiles like the Ishtar Gate of Babylon.

But it was Samarqand which received Timur’s fullest attention. The most prominent building in the city is the mosque of Bibi Khanum, which Timur built in memory of his wife in 801 - 808/1398 - 1405, with its monumental gateways and the double dome. This mosque is the first known specimen of the classical Jami‘ Mosque in Turkestan. The second masterpiece of this period is Timur’s own mausoleum at Samarqand, known as Gour-i Amir (Amir’s grave). It was constructed by Timur himself. It has an immense dome almost completely covered with glittering tiles. Its walls are

resplendent with multi-coloured slabs which are transformed by points into beautiful mosaics forming numerous Arabic and Persian inscriptions. To the right and the left arose two circular minarets. Ulugh Beg, who had inherited a passion for buildings from his grandfather, Timur, added to this tomb a series of other buildings. He also built a grandiose portal to the shrine.

Timur's son and successor, Mirza Shah Tukh (807 - 851/1404 - 1447), transferred his seat of government from Samarquand to Herat in Khurasan. He built there a citadel surrounded by a wall with four gates. The Jami' Mosque of Herat, which stood in the midst of the chief market, was the most beautiful in the whole of Khurasan. Shah Rukh's wife, Gauhar Shad Aqa, was also a great builder. She constructed a college at Herat (820 - 840/1417 - 1437). Its architect was Ustad Qawwan al-Din of Shiraz. The original marble slab of this college is still preserved in the Heart museum. It is calligraphed in thulth style by the renowned calligraphist Ja'far Jalal of Herat. Besides, Herat could boast of Musallah, the mausoleum of Gauhar shad Aqa and the madrasah of Hussain Baiqrah.

5. Muslim Architecture in Turkey

The Muslim architecture in Turkey (Anatolia) was inaugurated by the Saljuqs in the fifth/11th century. During the course of 250 years of their rule, the Suljuqs constructed many monumental buildings at Siwas, Quniyah, Kaiseri, Erezrum, Divrigi, Karman, and other important towns. These structures include mosques, tombs, mausoleums, palaces, castles, hospitals, caravanserais, market halls, public baths, public fountains, bridges, aqueducts and reservoirs. Quite a few are still extant. The Saljuq architectural traditions were not only maintained by the Ottoman Turks but reached their zenith both in quality and number in the tenth/16th and fifth/11th centuries.

The oldest mosque in Anatolia (fifth/11th century) built by the Turks is supposed to be the Ulu Cami at Siwas.²⁵ It is a rectangular structure surrounded by a wall. It has a covered portico, an open court, a flat roof with a layer of earth raised upon horizontal wooden rafters and stone pillars.

The richest and most impressive of the Saljuq mosques is the Ulu Cami at Divrigi (626/1229). It has two gateways. The applique motifs of the northern gate are suggestive of knitted or woven design. In the middle of the mosque is an octagonal water basin and above it a dome open to the sky. Outside the exterior walls is a ground minaret and inside a hexagonal conical dome.

The Saljuq mausoleums follow the style common in Khurasan and Merv - a high drum and a dome - with this difference that stone is used instead of bricks and the decoration takes the form of relief. These mausoleums are generally polygonal in shape. The polygons are joined by means of triangular surfaces to a square base resting on the ground. The roof consists of a flat dome inside a conical structure outside. They look like a tent in stone. The tomb of Khalifah Ghazi at Amaisia is one of the oldest monuments (541/1146) and the Douer Gumband (675/1276) is the richest one in decoration. It is a dodecagonal structure formed of blind arcades, side by side with geometrical designs we find fan-shaped palmettes and birds and lions in relief. The mausoleum of Khudaband Khatyun at Nigede

(712/1312) contains, besides floral and geometrical ornamentation, reliefs representing birds, stags, and other animals with human heads.

No complete Saljuq palace has survived, but history records several such buildings at Alaniya, Siwas, and Quniyah. For the pavilion and main building of the Saljuq palaces in Anatolia, the Khurasan house plan, with a courtyard and four ivans, served as a prototype. As a matter of fact, the same plan is followed in subsequent Ottoman palaces also - a number of pavilions (kiosks) and groups of buildings set among a succession of courtyards and gardens with ponds, the entire structure being surrounded by a wall.

There were medical schools also and these were attached to hospitals, for instance, the one at Siwas (614/1217), the largest of all Saljuq hospitals, had a medical college attached to it.

The Saljuq caravanserais, like their madrasahs, had strong gateways for security reasons, with the wall decoration concentrated upon them.

The Saljuq baths differ from those of Damascus in having a plan centred on an octagon with four ivans, and the washing arrangements without a common pool. The Sultan Hammam at Quniyah gives a good idea of Saljuq baths. There are separate twin buildings for men and women. The first room to be entered is the disrobing room (camegah) with marble floor and a fountain in the middle. From here a passage leads to the tepidarium (sogu kulul) for repose and massage. Then comes the hot room (sic alik) a domed octagonal hall round which are recesses (ivans) containing water basins and private rooms (khalwah).

With the downfall of the Saljuqs (654/1256), Anatolia was divided into more than a dozen independent principalities (beyliks) which ruled over various parts of the country for about 200 years. They were overcome by the Ottoman Turks.

The Ottoman Turks ruled over Turkey for almost 600 years (699 - 1342/1299 - 1923). During the Bursa period (699 - 907/1299 - 1501), which is also called the foundation period, the old Ulu Cami type of mosques continued to be constructed but the roofing consisted of co-ordinated domes. For instance, the Ulu Cami at Bursa, first capital of the Ottomans (745 - 801/1344 - 1399), had 20 domes and 12 piers all co-ordinated. But mosques with single domes were also built, for instance the "Ala al-Din Mosque at Bursa (726/1326) and the Green Mosque at Iznik (780/1378).

The mosque that set the pattern for the monumental mosques of the tenth/16th century was that of Bayazid II with a second half dome opposite to and in the same axis with the half dome that supported the central dome on the side of the mihrab. This principle was accepted by the famous Turkish architect Koca Sinan whose masterpiece is the Sulaimaniyyah Mosque (957 - 964/1550 - 1557). The mosque of Sinan Pasha, Ahmad Pasha, Sokkolu Muhammad Pasha, Mihrimah Khatun, and Rustam Pasha built by Sinan follow the same style. His great masterpiece, Sebiniyyah Mosque (977 - 983/1569 - 1575) at Edirne, however, had only one dome.

In the 11th/17th century, Turkish mosques followed the style of Shehrzadeh Mosque (950 - 955/1543 - 1548) which was also built by Sinan. It has a central dome supported and surrounded by four half domes. This

style may be seen in Sultan Ahmad's Mosque (1018 - 1025/1609 - 1616) and the Walid Mosque.

Under the Ottomans, madrasahs and hospitals followed the traditional style but the mental hospital of Bayazid II is quite original. It has separate rooms for mental patients and a communal hall of hexagon shape with dome open to the sky for psycho-pathical cases. At one end of the hall, there is a dais for musicians, and the acoustics are excellent.

The Ottoman mausoleums are invariably roofed with a dome. Decoration is restricted to coloured patterns, and facing of glazed tiles is applied inside instead of outside. Nearly all Ottoman Sultans are buried in Istanbul. One of the oldest mausoleums (868/1464) there is that of Mahmud Pasha, the Grand Vizier of Muhammad the Conqueror. It is octagonal in shape with its facade of geometrical patterned tiles inlaid in stones. The tomb of Sultan Sulaiman the Magnificent (974/1556) is a masterpiece of ornamentation. The tombs of Salim II (982/1574) and Murad III (1003/1595) are also the finest specimens of Turkish faience ornamentation. The marble tomb of Sultan Hamid (1203/1789) is a baroque.

Covered market is a special feature of Ottoman rulers. The covered market of Bursa has a colourful interior of stone and brick masonry that of Edirne (821/1418) has six piers and 14 domes. The famous market of 'Ali Pasha at Edirne (977/1569) built by Sinan had in addition six gates. The markets built by Muhammad the Conqueror and Sulaiman the Magnificent at Istanbul are most famous. The former has 15 domes and two rows of four pillars and the latter has 20 domes. These two constructions, with the addition from time to time of streets, comprise the famous covered market of Istanbul. It is really a market city.

It covers an area of 30,700 square metres and includes 65 streets, a square, 300 shops, 1,000 rooms, 18 gates, eight fountains, a school, wells, and 16 caravanserais. At the time of Sultan Muhammad and Sulaiman it was mainly the wood, but after the fire in 1113/1701 it was rebuilt in brick and stone. Architecturally, however, the so-called "Egyptian Market of Istanbul," which was built in 1071/1660, is far superior. The windows at the sides of the high, sloping roofed central portion give light at a lower level to the central passage, which forms a right angle, on either side of which are set the rows of shops, 88 in all, each covered by a dome. It is a singly-storied building except the entrance arcades. The effect of the interior is as impressive as that of a cathedral.

The earliest Ottoman palace was built at Bursa, called Bey Sarai, but no trace of this structure is found now.

The complex structure now called the Topkapi Palace (Seraglio) grew out of the subsequent additions to this palace by the Sultans through the centuries. The famous Topkapi Palace remained the residence of the Ottoman Sultans from the ninth/15th century to the 13th/19th century when they moved to Bosphorus. This palace was the centre of government as well as of culture. No other assemblage of buildings affords such an opportunity as this to study at one place the entire history of the Ottoman Architecture.

It covers 699,000 square metres of area, comprising five groups of apartments totalling 348 rooms, two groups of offices, eight servant

quarters, ten mosques, 14 paths, two hospitals, five schools, 12 libraries, 22 fountains, a fish pond and vineyard, one outer and four inner courts, and the whole assemblage is surrounded on the landside by a wall. At a time, food for 5,000 residents of the Palace was cooked at the royal kitchen.

In spite of the fact that the Topkapi Palace was not constructed and designed by any single architect, it still possesses a remarkably homogeneous character. The entire arrangement of the palace, with its non-geometrical sub-divisions and its terrace walls counter-acting the steep slope of the ground, conforms admirably to present day principles of town planning.

It is not possible to give full description of the palace. The third and fourth courts, however, contain the most interesting buildings. The structure in which foreign envoys were received by the Sultan (Arzodasht) is a marvel of the ninth/15th century architecture. The library of Sultan Ahmad (1131/1719) is remarkable for its plan and marble facade. The Baghdad Pavilion (1048/1638) in the fourth court contains four ivans and one central dome. Its terraces, facing the Bosphorus and the Golden Horn, are surmounted by a wide caved roof supported on arcades. The walls are faced, both inside and outside, with tiles. The Pavilion of Mustafa Pasha (1116/1704) is in Rococo-Turkish style, made in wood, to serve summer requirements.

Unlike the Il-Khanid monuments of Persia and Central Asia, Turkish architecture on the whole is horizontal, not vertical. The height of Turkish buildings is much less than their length and expansion. According to Behcat Uncal, this horizontal effect gives an impression of comfort and repose. In religious buildings, solid parts pre-dominate over the window openings. On the other hand, in secular buildings, window strips dominate the facade. The Turks avoided total symmetry in their ground plans and facades.

6. Muslim Architecture in Pakistan and India

The Muslim conquest of Indo-Pakistan sub-continent started in 94/712 when Muhammad bin Qasim invaded Sind. Contemporary records show that he constructed a mosque and other buildings at Daibul, but these structures no longer exist. Recently some excavations made in southern Sind led to the discovery of certain traces of ancient monuments. But the experts have not yet come to any final conclusion with regard to the age of these structures. Suggestions have been made that the rectangular foundation excavated at Bhambor is that of the first mosque on the sub-continent built at the time of Muhammad bin Qasim.

Similarly, no Muslim monument built before the middle of the sixth/12th century has so far been discovered although it is known that Multan had been an important centre of Muslim culture prior to Mahmud of Ghaznah's excursions. After Lahore was conquered by Mahmud in 393/1002 a permanent garrison of Afghan soldiers was established there.²⁶ Later on, Lahore became the capital of Mahmud's successors (492/1098 - 582/1186). It is, therefore, most probable that mosques, palaces, tombs, and other structures built by Muslim rulers of Multan, Lahore, and other small principalities in the Indus Valley between the second/eighth and the

sixth/12th centuries suffered at the hands of invaders or were destroyed by the ravages of time. What exists today belongs to a much later period as compared with Iraq, Syria, Iran, Egypt and Spain.

Indo-Islamic architecture, during its history of more than five centuries (545 - 1119/1150 - 1707), however, covers such a vast area and has passed through so many stages and styles that in this brief section only a passing reference can be made to them. Besides the imperial style of Delhi, which served as a model, at least eight very marked provincial styles have been noted by experts. These provincial styles belong the West Punjab (545 - 725/1150 - 1325), Bengal (597 - 957/1200 - 1550), Jaunpur (762 - 885/1360 - 1480), Gujrat (700 - 957/1300 - 1550), Mandu and Malwah (808 - 977/1405 - 1569), the Deccan (748 - 1206/1347 - 1617), Bijapur and Khandesh (828 - 1067/1425 - 1656), and Kashmir (813 - 1112/1410 - 1700). One of these styles the Multan style in West Punjab - is even older than the imperial style of Delhi.

The earliest Muslim monument in the Indo-Pakistan sub-continent happens to be the tomb of Shah Yusuf Gardezi at Multan, built in 547/1152.²⁷ It is a rectangular structure with a flat roof. One of the walls has an oblong portion which is slightly projected to frame the entrance. The walls are completely encased in the most colourful tiles for which Multan has always been famous. These tiles are decorated with geometrical, inscriptional, and floral motifs. The absence of domes, pillars, and arches in this modest building is very significant.

It was at Delhi that the foundations of Muslim architecture were laid on a grand scale. Soon after he made this imperial city his capital in 587/1191, Qutub al-Din Aibak ordered the construction of the famous Quwwat al-Islam Mosque in 592/1196. This is the oldest mosque extant in the Indo-Pakistan sub-continent. It consists of rectangular courtyard (141 ft x 105 ft) surrounded by pillared cloisters. The sanctuary on the western side possessed elaborate series of aisles with shallow domed ceilings. In front of the sanctuary was placed an iron pillar brought from Mathura as a mark of victory.

Three years later, an expansive arched facade was built across the entire front of the sanctuary. Its pointed arches made in red stone are magnificently carved with inscriptions and floral motifs. They produced the effect of loftiness and lightness as, following the contemporary north Iranian style; they are vertical in their composition.

Qutub al-Din Aibak laid the foundations of another most remarkable building the same year. It was the Qutub Minar. Although it was constructed at a time when Muslim in India was hardly established, it has never been surpassed in the boldness of its conception, its aesthetic composition, its exquisite execution, and its imposing effect. It is a unique monument in the entire Muslim history. The idea of this fluted and star-shaped tower was certainly borrowed from Ghaznah as well as North Iran, where the ruins of similar towers still exist. But the Qutub Minar has surpassed all such towers. It lies outside the Quwwat al-Islam Mosque and was probably designed on the basis of Samarra mosque or the mosque of ibn Tulun (second/eighth and third/ninth centuries).

It is a five-storeyed building with a domical roof. The storeys diminish in height and dimension as they ascend and are ornamented by four projecting balconies. Between these balconies there are richly sculptured and raised bands containing Arabic inscriptions. The basement contains six such bands. The lowest storey has 24 projecting ribs forming the flutes. They are alternately angular and circular in the first storey, only circular in the second, and angular in the third. The other two storeys are of plain marble with red stone belts and were added later. Its tapering construction produces the effect of a height greater than the actual which is 238 feet.

A notable contribution of Muslim architecture in India was made by Sultan Shams al-Din Iltutmish (606 - 643/1211 - 1236) who added the famous arched screen in front of the Ajmere mosque built by his predecessor in 597/1200. These arches, seven in number, extending over 200 feet, more nearly approach the four-centred type invariable found in subsequent Muslim buildings. Each arch is surrounded by three lines of writing, the outer Kufic, the other two in Arabic characters separated from each other by bands of carved arabesque ornament.

Another significant aspect of Muslim architecture in the seventh/13th century is the construction of a large number of tombs. Famous among these are the tombs built by Iltutmish for his son at Sultan Ghari (626/1231) and for himself (633/1235) and the tomb of Sultan Balban (679/1280), in Delhi. The shrines of Shah Baha al-Haq (661/1262), Shah Shams al-Din Tabriz (675/1276) and Shah Rukn-i 'Alam (720/1320) at Multan also belong to the same period. The last named Shrine is one of the most impressive buildings in Pakistan. It is an octagonal structure with sloping walls having tapering turrets at the angles. Erected on an elevated plane, its total height is 115 feet and the dome is 50 feet wide inside. It is made in brick with bands of carved chiselled and parts are inlaid with glazed tiles suggest the Arab-Iranian origin of Multan architecture.

The beginning of the eighth/14th century brought a remarkable change in the imperial style at Delhi. This change was caused by the invasion of Central Asia and Iran by the Mongols. Bringing death and destruction in their wake, the Mongols were responsible for a large scale migration of Turkish and Persian architects, engineers, and artisans to Delhi and it was this group of people who built the famous 'Ala'i Darwazah (705/1305), one of the most exquisite piece of architecture near the Qutub Minar. The 'Ala'i Darwazah (the Gateway of 'Ala al-Din Khalji) occupies a key position in the evolution of Muslim architecture in India. A mere glance at this elegant gate will show that it must have been built by expert architects, having knowledge, vision, and capacity to prepare the design in detail before it was executed. Its style is distinctive and original. The method of its walling, the shape of its arches, the system of support for the dome, and the design of surface decoration all suggest supervision of master builders.

The main arch is a pointed horse shoe. It is rather vertical, the width of its span being much less in proportion to its height. There are bands of inscriptions carved in white marble.

The Tughlaqs who ruled over India from 720/1320 to 816/1413 were great builders. The founder of the Tughlaq dynasty, a soldier who ruled

hardly for five years (720 - 725/1320 - 1325), managed to build in this short period a fort, a palace, his own tomb, and the fortified city of Tughlaqabad. This was the first capital city founded by any Muslim monarch in India, although Sultan 'Ala al-Din Khalji, his predecessor, had also earlier planned a similar capital. Tughlaqabad, near Delhi, is now in ruins except for the tomb of the warrior king. It is a unique building as the tomb looks more like an independent fortress than a burial place.

Perhaps the disturbed political conditions, on account of Mongol invasion, demanded the expediency of utilizing every building for defence purposes in times of emergency. This fortress tomb was built on a high plane. It is made in red sandstone and white marble. It has thick sloping outer walls giving the building a pyramidal appearance. Its doorway is literally a death trap for intruders and within the courtyard there is solidly built underground vaults for hoarded wealth. The dome is pointed Tartar in shape - a style followed throughout the Muslim period in India. This pentagon produces the effect of great strength, solidity, and robustness.

The Mongol invaders could not destroy Delhi; this was done by one of her own rulers, Muhammad Tughlaq, who moved his capital to Daulatabad in the south. Delhi became a deserted city and all its trade, art, and industry were completely ruined. Most of the artisans and architects, who could manage to escape from the Royal camp, took refuge in provincial capitals with the result that when the capital was restored by Firuz Taghlaq was no more master builders were to be found in Delhi.

The Royal treasury was also empty and the economic condition of the subjects had become much deteriorated. In spite of the fact that Faruz Taghlaq proved to be one of the greatest builders India has ever produced, his buildings had to be simple and unornamented, producing the effect of austere severity. Gone were the engravings and carvings, the refined decorative motifs, and the well finished and properly cut stone pieces of marble and red stone, and the embellishments of the outer and inner surfaces. Instead, walls were made of rubble covered with thick layers of cement. It was the puritanical phase of architectural asceticism.

Firuz Shah Tughlaq built four fortified cities in North India: Firuz Shah Kotlah in Delhi, Jaunpur, Hissar, and Fatehabad. Firuz Shah's fortified citadel in Delhi was situated on the river bank. It was roughly a rectangle with rectangular courtyards, baths, tanks, gardens, palaces, barracks, a huge Jami' mosque for a congregation of 10,000 people, servant quarters, etc. The main architectural principles of palace-fort, followed by the great Mughuls at Agra, Delhi, Allahabad, and other places, had been laid down by Firuz Shah.

Several mosques were built in Delhi by Firuz Tughlaq between 772/1370 and 777/1375, the most famous being the Khirki Mosque. It was built on a tehkhanah or sub-structure of arches. It is a unique construction as it is almost a covered mosque like Saljuq mosques in Turkey, a rare phenomenon in India. The portal is for the first time reached by some flights of steps. It is entered through an arch and beamed doorway. The interior consists of cloisters formed by a series of square bays, each one roofed by a cup-shaped dome. There are three rows of such domes, each row having

three constellations of nine domes each. Thus, there are in all 81 such domes. Each corner of the rectangles is supported by a tower and a tapering round bastion.

The invasion of Timur in 801/1398 was a major calamity for India. He not only sacked Delhi but took away with him Indian artisans to build the famous Jami' Mosque at Samarqand. Delhi lost its political supremacy. The rule of Sayyid and Lodhi monarchs were confined to the Gangetic basin only. And during the whole of the ninth/15th century and the first quarter of the tenth/16th century Delhi could boast of no architectural achievements. No palaces, no mosques, no forts, and no cities were built, only tombs were erected as memorials to the dead.

However, a significant addition in the construction of domes was made in this period. This was the introduction of double dome in India, although this style of dome-making had been practised in other Muslim countries for centuries. We find this double dome - an inner and an outer shell to raise the height of the dome without disturbing the interior plan - for the first time in the tomb of Sultan Sikandar Lodhi (924/1518).

Bengal

The Muslim architecture of Bengal is as old as that of imperial Delhi, as Bengal was conquered by one of Qutub al-Din Aibak's generals in 599/1202. It soon became an independent kingdom and remained so until it was annexed by Akbar the Great in 984/1576. The Muslim monarchs of Bengal were men of fine taste and they built scores of mosques, palaces, and other structures at their capitals at Gaur and Pandua bear testimony to their architectural genius but nowhere have climatic and physical conditions caused greater havoc to Muslim monuments than in Bengal. As no stone was available in the vicinity, most of these buildings were constructed in bricks could not withstand the onslaughts of heavy rains, storms, and humidity.

The oldest Muslim monument in Bengal is the multi-domed mosque at the village of Pandua. It was built in the middle of the seventh/13th century. It is the oldest multi-domed mosque in the entire sub-continent. Another very significant structure erected at Pandua is the Adina Mosque (766/1364). It was the focal point of the new capital city built by Sikandar Shah (759 - 791/1358 - 1389). The Adina Mosque, a double storeyed structure constructed on orthodox lines, is the largest and the most impressive building in Bengal. It is as big as the Great mosque at Damascus (705 ft x 285 ft). "To the spectator standing within the expensive quadrangular court of the Adina Mosque, surrounded by its seemingly endless archways, the conception as a whole presents the appearance of the forum of some ancient classical city rather than a self-contained Muslim house of prayer, with the high-vaulted sanctuary on the western side simulating an imperial approach in the form of a majestic triumphal archway."²⁸

Around the courtyard is a screen of arches, 88 in number. The roof is covered with 306 domes. The upper storey, probably a Royal Chapel, is supported on a range of arches carried by unusual pillars. These are very short but ponderous piers, abnormally thick, and square above and below.

These pillars are unique in their construction and are found nowhere in India. The interior of the sanctuary hall is a superb pointed arch vault, the earliest and the rarest example of its kind in India. The design and execution of the central niche are also most impressive. It is inscribed with delicate arabesque and calligraphic texts.

The Muslim architecture in Bengal was partly conditioned by its climate, for due to excessive rains the surface of the roof had to be curved and covered with a number of small domes. The finest examples of such curved roofs may be seen in Chota Sona Masjid at Gaur (899/1493) and Qadam Rasul. Another characteristic of Bengal monuments is their “drop” arches in which the span is greater than the radius.

Jaunpur

Jaunpur was made a provincial capital by Firuz Toghlaq who built there a fort and laid the foundations of Atala Mosque. Later on, the famous Sharqi monarchs of Jaunpur adorned their city with mosques, tombs, palaces and other buildings associated with an imperial capital. As a matter of fact, Jaunpur became the cultural capital of Northern India under the Sharqi monarchs. It was called “Shiraz of the East.” Sikander Lodhi, the Sultan of Delhi, completely destroyed this city’s Royal structures when he occupied it in 885/1480; its five mosques alone were spared. The most outstanding characteristic of these stone-built mosques is the pylon formation of their facades. Most famous among these mosques are the Atala Mosque and the Mami‘ Masjid completed in 811/1408 and 875/1470 respectively.

The sky high pylons of these mosques have a unique construction, the like of which is not to be found anywhere in the Muslim world. Their origin is unknown. John Terry, however, suggests that since the early Muslim rulers of Jaunpur were Abyssinians, these pylon-like portals might have been inspired by the pylons of Pharaonic temples in the Nile Valley.²⁹

The Atala Masjid is a very distinctive and majestic building. Although its general arrangements are conventional, its double-storeyed cloisters are very spacious, having 42 feet across and five aisles deep.

Many of the elements found in Jaunpur buildings were derived from the architecture of the Tughlaqs at Delhi, for instance, the recessed arch with its fringe ornamentation, the shape of the arch, and the sloping side of its supports, the beam and brackets supporting the arches, the tapering turrets, the square shafts of the pillars, and the imposing flights of steps leading to the portals, all suggest that artisans trained in the imperial style at Delhi during the eighth/14th century and the beginning of the next were brought to Jaunpur. Jaunpur mosques show a very pleasant innovation in providing especially constructed galleries for religious needs of women. These galleries were covered with beautiful open work screens as seen in the Lal Darwazah Mosque (854/1450).

Although Jaunpur mosques do not display much refinement, they are strong, sincere, and purposeful in their character. They are good examples of bold and forceful workmanship.

Gujrat (700 - 957/1300 - 1500)

Gujrat presents by far the most graceful provincial style in the annals of Indian architecture. The Gujart style of architecture, in the course of 250

years of Muslim rule, passed through three marked stages: the formative and experimental stage well represented by the Jami' Masjid at Cambay (725/1325), the middle stage of increased assurance and directional authority, the best and most consummate illustration of which may be found in the Jami' Masjid at Ahmedabad, and the final stage when it reached its zenith in the latter half of the ninth/15th century under the patronage of Mahmud Begarha I (863 - 917/1458 - 1511), the typical example being that of the Jami' Masjid at Champaner.

In the Cambay mosque, though much was borrowed from the Delhi style of Khalji period and also from the Ajmere mosque, its fine proportions, dignified appearance, and simple design provided a model for subsequent mosques in Gujrat.

The second phase owes its existence to Ahmad Shah, the great builder, who founded the capital city of Ahmedabad (814/1411). His zeal for building projects was matched by that of his courtiers and successors, so much so that few cities can claim to possess larger numbers and finer specimens of monumental architecture than the capital of the Ahmad Shahi dynasty. Besides, many tombs and other structures, one can count more than 50 mosques of that period in Ahmedabad alone. Ahmad Shah's citadel with its palace is situated on the left bank of the river of Sabarmati. It is a rectangular enclosure occupying a prominent position. Almost in the heart of the town was built the great Jami' Masjid connected with the citadel by a wide avenue. Astride this avenue was erected a stately triumphal gateway called the Tin Darwazah as it possesses three arched entrances. The entire conception was a bold attempt at town planning not usually found in provincial towns.

The Jami' Masjid of Ahmedabad is considered the high water mark of mosque design in western India. In its sanctuary have been combined two different facade conventions, the screen of arches on the one hand and the pillared portico on the other. Thus, a subtle contrast between the volume and strength of the wall surface and the depth and lightness of the colonnade has been achieved.

In the reign of Muhammad Shah (846 - 855/1442 - 1451), son and successor of Ahmad Shah, Sarkhaj, a suburb of Ahmedabad, acquired great importance as the burial place of a divine. Here palaces, gardens, pavilions, gateways and a large artificial lake, besides mosques and mausoleums, were erected on a grand scale.

The Gujrat architecture attained its third and final stage during the reign of Mahmud Begarha I. He founded three cities, and adorned them with imposing buildings. Moreover, splendid constructions were added to the glory of Ahmedabad. Most of these were mausoleums, four of which are the Raudahs (tombs) of Sayyid 'Uthman at Usmanpur, of Sheikh Ahmad Khatu at Sarkhel, of Shah 'Alam, and of Mubarak Sayyid near Mahmudabad.

Most famous among the mosques of this period are the mosques of Mian Khan Chishti (861/1456), of Bibi Achut Kuki (877/1472), of Mahfuz Khan (898/1492), and finally Sidi Sayyid which last is a notable departure from the conventional mosque design. It is composed entirely of arcades of arches; eight square piers support these to form the interior over which is

laid a flat roof. The walls of the sanctuary are composed largely of perforated stone screens. For the first time, the entire screen has been perforated with “palm and parasite” motif with a wonderful skill and aesthetic taste.

Sultan Mahmud Begarha built a new capital also, at Champaner, 78 miles south-east of Ahmedabad. It was a walled citadel with palaces, a Jami‘ Mosque, and other usual constructions.

The Deccan

The Muslim architecture of the Deccan was the product of the amalgamation of two separate trends introduced in South India from Delhi and Iran in the eighth/14th century. Another notable feature of the Deccan monuments was the almost complete absence in them of any influence of the then existing South Indian art, in spite of the fact that this territory was so rich in the Chalukyan and Dravidian temple architecture. It is surprising that, while Muslim architects of North and West India freely borrowed from the local style, their co-religionists in the South preferred not to be in any way obliged to and affected by the styles prevalent in the Deccan.

The Deccan was first conquered by Sultan ‘Ala al-Din Khalji. But the first independent Muslim ruler of South India was a Persian adventurer, ‘Ala al-Din Hassan Bahman Shah. He had served under Sultan Muhammad Tughlaq at Daulatabad. He established the Bahmani dynasty at Gulbargah (748/1347), the fortress of which is considered a most remarkable production of military architecture. Almost carved out of a living rock, this fortress is now in ruins except for its most extra-ordinary Jami‘ Mosque built in 769/1367. It is one of the few Indian mosques entirely covered like the Cordova mosque.

The whole area, including the courtyard, is roofed over by 63 small domes. Light is admitted through the side walls which are pierced by great arches. It was built by Muhammad Rafi‘, a hereditary architect of Qaswin in northern Iran, who must have trained in the Saljuq style of covered mosques found in Turkey. Other monuments of the Bahmani period at Gulbargah include scores of Royal tombs including the famous Haft Gumbad (seven domes).

The most unique construction of the entire history of Indian architecture is the Gulbargah market, 570 feet long and 60 feet wide, adorned with a range of 61 arches on either side supported by pillars and flanked with a block of buildings of a highly ornamental character.³⁰

The Bahmani capital was moved from Gulbargah to Bidar by Ahmad Shah (826 - 840/1422 - 1436). It was adorned with a fortress, palaces, two mosques, and the famous college built in 877/1472 by the great scholar minister Khuwaja Mahmud Gawan. It was a three-storeyed building with loft towers. Its surface is almost wholly covered with glazed tiles of green, yellow, and white colour with floral and inscriptional motifs gracefully executed by expert hands.

But the magnificent monument of the ‘Adil Shahi rulers of Bijapur far excel those in other capital cities of the Deccan. In number, too, they are second to none; there are more than 50 mosques, 20 tombs, and nearly the same number of palaces in Bijapur. These were constructed within 100

years after 957/1550. Prominent among these buildings are the Jami' Masjid, the most powerfully simple mosque, the Raudah of Ibrahim, one of the most elaborate tombs, the GOL Gumbad, a grandiose structure, and the Mihtar Mahal, the most delicate and the most refined of the all.

The Gol Gumbad, the mausoleum of Muhammad 'Adil Shah, is considerably larger than the pantheon in Rome, and it has the largest domical roof in existence. This huge dome is based on a circular cornice obtained through interesting arches. This method of constructing intersecting arches, perhaps of Turkish origin, was a favourite device with Bijapur artisans. It was unknown in other parts of India. Besides being of great utility in dome construction, these intersecting arches produce an exceedingly aesthetic effect, those for instance in the sanctuary of the Jami' Masjid at Bijapur.

Malwah

The small independent State of Malwah in Central India lasted for about one and a half centuries (804 - 937/1401 - 1530). Its capital, Mandu, was situated on a plateau possessing a very picturesque view. It was adorned by Hoshang Shah (807 - 839/1405 - 1435) and Mahmud Shah I (940 - 974/1436 - 1469) with magnificent palaces, mosques, and other buildings, finest among which was the Jami' Masjid (858/1454). It was a multi-domed building with repeated arcades of arches forming the sanctuary.

Facing the mosque and situated on an elevated plain is the large structural complex called the Ashrafi Mahal (Palace of the Gold Mohar). It was built by Mahmud Shah I. This complex consists of a college, a mausoleum, and a tower of victory.

Two other notable buildings in Mandu are the Hindola Mahal (swinging palace) and the Jahaz Mahal (ship palace). The former was built by Hoshang Shah and is a combination of audience hall and Royal apartments. The latter was built by Mahmud I and is a double-storeyed building extending for some 260 feet along the water-front of two small lakes. It is a colourful structure suggesting gaiety and entertainment.

These and other palaces and mosques of Mandu are all built in red sandstone. For decorative purposes, the builders used marble and various semi-precious stones such as jasper, agate, and coruclian which were found in the vicinity. Glazed blue and yellow tiles were also employed as panels and borders. It is, therefore, correct to say that Mandu monuments are noteworthy not for their structural qualities but for their decorative properties, in which an aesthetic colour sense takes a prominent position.

The Mughul Period (933 - 1119/1536 - 1707)

The Mughul Emperors of India were descendants of a highly cultured dynasty. Their great ancestor, Timur, had embellished his capital city of Samarqand with exquisite palaces, mosques, mausoleums, and madrasahs. Babur, the founder of the Mughul Empire, too, was a scholar-warrior of a remarkably refined taste. In his "Memoirs" he relates that a considerable amount of construction in India was undertaken under his order, although he ruled only for five years. Two mosques attributed to him still exist - one at Panipat in east Punjab and the other at Sambhal, a town east of Delhi. They are, however, built in the traditional style.

The first construction in pure Mughul style, a combination of Persian and Indian style was erected at Delhi in 972/1564 by Emperor Humayun's Queen in memory of her beloved consort. During Humayun's forced sojourn in Iran, she faithfully stood by him for 12 years. She must have acquired a taste for Persian architecture there. When she decided to build Humayun's tomb, she entrusted the task to an Iranian architect, Mirak Mirza Ghiyath. The result was that for the first time a Persian conception was interpreted in Indian architecture.

The introduction of bulbous domes, so common in Iran and Central Asia, and of arched alcoves, a complex of rooms, corridors and a vast garden surrounding the tomb was a significant landmark in Indian architecture. Added to these purely Persian innovations were certain Indian characteristics such as the fanciful kiosks with their elegant cupolas and excellent stone masonry combined with artistic marble work. From these it is obvious that there emerged a new style under the Mongols, the origin of which can be easily traced in Humayun's tomb.

This style was almost perfected by Akbar the Great, who constructed numerous buildings during his long reign. He built four great fortresses: at Agra in 972/1564, at Ajmere in 978/1570, at Allahabad in 991/1583, and at Lahore at almost the same time. According to A'in-i Akbari, "there were built upwards of 500 edifices of red stone in the fine styles of Bengal and Gujrat" in Agra fort alone.³¹

The most complete of these buildings is the palace called the Jahangir Mahal in Agra. The palace-fortress of Lahore is unique in this respect that its outer walls are decorated with glazed tiles with sport motifs such as elephant combats, games of polo, and hunting episodes. Figure compositions and floral devices also are found in the panels.

The most monumental achievement of Akbar is Fatehpur Sikri, his new capital city, 26 miles west of Agra. It is a complex of palaces, official residences, and religious buildings, so designed and executed as to form one of the most spectacular structural productions in the whole of India. These are all built in red stone. Famous among them is the Diwan-i Khas (private audience hall), the Jami' Masjid with its Buland Darwazah (high gate) and palaces of Queen Jodha Ba'i, Maryam Sultanah, Rajah Birbal and Hawa Mahal.

The Diwan-i Khas is a rectangular hall with unique arrangements. It has a large and circular pillar in the centre, its massive capital supporting a circular platform. From this platform stone bridges radiate along each diagonal of the hall to connect it with hanging galleries. The Emperor used to sit on the central platform and listen to discussions among scholars of different religions.

The most impressive single structure of Fatehpur Sikri is the Buland Darwazah which was built in 979/1571 to commemorate the conquest of the Deccan. It is 134 feet high with a further flight of steps, 42 feet high. Across its front, the gate measures 130 feet. It serves as entrance to the Jami' Masjid containing the tomb of Sheikh Salim Chishti.

Emperor Akbar's son, Jahangir, was not much interested in buildings. The only important construction undertaken during his reign was Akbar's

tomb at Sikandarah in 1022/1613. Unlike previous mausoleums, Akbar's tomb has no dome. It seems that a new group of architects were trying to evolve a style different from the one followed by earlier Mughuls. Two more tombs were built in the same style in which the central dome was replaced by a rectangular pavilion. These were the tombs of I'timad al-Daulah built at Agra in 1036/1626 and the tomb of Jahangir built at Lahore. Both were constructed under orders of Queen Nur Jahan. Of these three, the tomb of I'timad al-Daulah is the most delicate and ornate piece of architecture. It is made of marble with its surface tastefully decorated with precious stones of different colours. This inlaid work is in pictura dura style.

The reign of Emperor Shah Jahan (1036 - 1069/1627 - 1658) is the golden age of Mughul architecture. While Akbar's monuments surpassed those of his predecessors in red stone architecture, his illustrious grandson preferred the use of marble on a scale unparalleled in history. His was the age of marble and its architectural style was determined by marble forms with the result that the character of the arches had to be altered into a foliated one, white marble arcades of engrailed arches became a distinguishing feature of Shah Jahan's buildings. The bulbous dome also was constricted at the neck and ornamental elements became curvilinear.

Shah Jahan was almost possessed with a passion for buildings. He started with the Agra Fort wherein he built the marble hall of Diwan-i 'Am as soon as he ascended the throne in 1037/1627. Ten years later, the Diwan-i Khas, a hall also made of marble, was added to it. The double columns of this hall are amongst the most graceful constructions of his reign. From time to time, several other palaces, pavilions, and mosques, e.g. the Khas Mahal, the Shish Mahal, the Muthamman Burj, the Moti Masjid, and the Naginah Masjid, were added to the complex inside the citadel.

In 1048/1638, Shah Jahan decided to transfer his capital to Delhi where he laid the foundations of Shah Jahanabad, a palace-fortress on the right bank of the river Jamuna. The vast, oblong complex is a city within a city. It is a well planned enclosure and a product of the architectural genius of Shah Jahan himself.

The citadel, made of red stone and marble, consists of four groups of buildings arranged symmetrically. The large central quadrangle contains the Diwan-i 'Am, the two square court-yards in the form of ornamental gardens on either side, and the range of marble palaces along the riverside. These palaces include the Rang Mahal and the Diwan-i Khas, two most lavishly ornate buildings considered to be the crowning jewels of Shah Jahan's seraglio.

Since the citadel did not include any mosque, Shah Jahan built the famous Jami' Masjid of Delhi on a site near his palace. It is erected on a lofty plinth and is one of the two largest and most famous mosques in the sub-continent, the other being the Badshahi Masjid of Lahore. Rectangular in shape, the Jami' Masjid has tree entrances, the main and the most imposing entrance faces the east and much resembles Akbar's Buland Darwazah at Fatehpur Sikri. It is made in red stone and marble. The three domes are made of marble with vertical strips of black stone inset at regular intervals.

Several noteworthy buildings were erected by Shah Jahan and his governor at Thattah, the then capital of the province of Sind. Among these are the Jami‘ Masjid, begun in 1057/1647, and a group of tombs built on the Makli Hill by Mirza ‘Isa Khan who governed Sind from 1037/1627 to 1054/1644. The Jami‘ Masjid is built of bricks decorated with glazed tiles of blue, white, and yellow colours. These tiles were cut in very small sizes, only have an inch wide, thus nearly 100 such tiles have been used within one square foot producing a mosaic effect. The designs are chiefly geometrical, but the spandrils of the arches often show conventional floral compositions.

Since stone and wood were scarce in Sind, most of the construction was done in bricks and glazed tiles. The architectural style of Sind closely resembles that of contemporary Persia - brick walls arcaded with Tudor type arches, kiosks with cupolas, a “Lodhi” style dome, and the outer surface embellished with glazed tile work.

The greatest masterpiece of Shah Jahan is the Taj Mahal (1042 - 1050/1632 - 1650), built by the Emperor in memory of his beloved Queen at Agra on the bank of the river Jamuna. This exquisite poetry in marble touches the highest pinnacle of Muslim architecture and is unsurpassed in history. Its rhythmic proportion, its atmospheric setting, its feminine delicacy, its animated ornamentation, and its pleasing symmetry make the Taj Mahal one of the great wonders of the world.

While Shah Jahan built in marble and red stone, brick and glazed tile were patronized by the nobility. The finest example of this type of buildings is the famous mosque of Wazir Khan in Lahore. Built on conventional lines, every portion of its structure, both inside and outside, is enriched with a variegated scheme of colours either by means of floral patterns painted in tempera or panels of more conventional designs executed in lustrous glaze.

The Mughuls were very fond of landscape architecture. Nothing pleased them more than ornamental gardens, traces of which are found almost in every city where the Mughuls had lived. The most famous among these are the Shalimar Gardens and the Nishat Bagh of Srinagar and the Shalimar Gardens of Lahore, all three of them built by Shah Jahan. These gardens, like most of the Mughul buildings, are almost always symmetrical and geometrical. But their rectangular terraces, kiosks, balconies, pools, fountains, and cascades present a most pleasant effect and testify to the refined taste of their originators.

The Emperor Aurangzib (1068 - 1119/1657 - 1707) was the last of the great Mughuls. Although too much occupied in political affairs of the state to indulge in constructional work, he has left a famous monument in the Badshahi Masjid of Lahore, the present capital of West Pakistan. Built in red stone and marble, the Badshahi Masjid is one of the two biggest mosques in Indo-Pakistan sub-continent and is an imposing example of strength, solidity and expanse.

With the death of Aurangzib in 1119/1707, the glorious chapter of Muslim architecture in this sub-continent came to an end. The decline of the Moghul Empire was so swift and the political conditions prevailing in Lahore, Delhi, and other important centres of Muslim culture so insecure

and unsettled that traces of late 12th/18th century Muslim structures are very rare.

Chapter 56: Painting

A. Introduction

It is difficult to distinguish Muslim contribution to painting from the history of Muslim painting. An assessment of Muslim contribution to this art would involve a consideration of the changing and growing attitude of Muslims towards painting and a study of the historical background which determined this attitude. Both these considerations are necessary because they imply each other, an understanding of the one without the other is bound to be inadequate and lopsided. Let us first consider the Muslim attitude towards painting.

It seems that Muslim attitude towards painting in the early history of Islam was hostile. This was justifiable because Fine Arts had at that time an uncanny association with pagan beliefs and rituals. Painting was reminiscent of polytheism which Islam had come to fight against and destroy. Islam then needed an extraverted attitude - an attitude in which the soft and feminine qualities of artistic creation and appreciation could find little room. The social consciousness of man at that period of history did not have sufficient insight into subtle differentiation of various aspects of life. Being a facet of pagan polytheism painting was prohibited by Islam in its zeal to break idols.

Profound aesthetic possibilities inherent in Islam had to lie dormant to be realized only when was ripe for their realization, i.e. after Islam had succeeded in its mission to make monotheism an effective force in the development of human consciousness and to foster and nourish the scientific impulse so that man could become master of his history and responsible for its vicissitudes. Once this attitude was fairly established in their history, the Muslims began to pay attention to those pagan pursuits which they had neglected before which were now shorn of their polytheistic associations. Painting was no longer the art of making images but the art of breaking images. Through painting one could now cast out the devils of one's heart and thus prepare one's soul for direct encounter with God. There was no longer any question of worshipping the gods one painted, for no longer did they remain the objects of worship for the Muslim mind.¹

Orientalists have always seen Muslim paintings through coloured spectacles. They enumerated the influence which moulded the character of Muslim art and maintain by deft implication that Muslim art could be reduced to these influences, that there was nothing original in this art. They do not see that Islam not only absorbed external influences but also modified them to suit its own native genius. Muslim painting was only an aspect of Muslim life. It was an expression of the spiritual explorations of sensitive minds. These sensitive minds, rooted in their own culture, had their own peculiar longings and yearnings, aspiration, and conflicts. It was out of these dynamic forces that peculiar idioms and patterns which we call by the name of Muslim Art.

B. Characteristics of Muslim Painting

Muslim painting began under a shadow - the shadow of taboo on pictorial representation of material things. Islam started its career as an

iconoclastic missionary religion to the main aim of which to establish a social order based on reason. It propounded laws, made institutions, and fostered organizations that the ideal could come to earth. It not only enunciated values and principles but also tried to demonstrate that they could be realized in this mortal life of ours. In this endeavour, Islam had to suppress the pagan orientation not only of the Arabs but of all the peoples it conquered. Paganism had an uncanny and almost an internal relation with idol-worship, and Fine Arts were the only means by which idols could be raised and formed in such a way that they could, by their beauty and elegance, induce in the beholders a mood of devotion and emotional abandon.

The aesthetic sense among the pagans was the religious sense. Devotion to beauty and worship were identified in the pagan mind. Paganism was the cult of the irrational. It was based on the bond between the primitive man and the forces of nature that he faced in his daily life. Islam came with the message that there is only one God, that He alone is worthy of worship, and that the forces of nature can be subjugated and bent to serve man's will and desire. It was necessary for Islam at that stage to sub-ordinate the aesthetic to the moral and the beautiful to the good. It was, therefore, a historical necessity which led early Muslims to prohibit the art which fostered representation of gods, goddesses, and national heroes as objects of worship. It did not mean that such a prohibition is inherent in Islam.

Muslim painting, therefore, began with a handicap. Without this handicap its individual and unique character is not conceivable. Some of the unique characteristics of Muslim painting are as follows:

1. Muslims loved their Holy Book, the Qur'an. In their attempt to copy it they tried to write it beautifully and gracefully. They developed new forms of writing and created novel movements in calligraphy. The forceful and lyrical language of the Holy Qur'an induced them to write it with passion and warmth to introduce cadence and grace to the form of the written word. Muslim painting is the result of these movements in calligraphy. Thus, we find that Muslim painters emphasize line (khat) more than anything else. A powerful and colourful line and a forceful stroke can create a ravishing form, pulsating with charm and fascination. It is the "line" that matters, everything else would take care of itself. Whether it is a straight line or curve, the stroke alone is responsible for the aesthetic forms; it provides the criterion of beauty.

2. Islam implies a serious commitment to history. For Islam, nature is interesting only as a background to human personality and human deeds. Muslim painters are intensely alive members of Muslim society. For them wars and battles, rise and fall of dynasties, destruction and construction of cities are not matters to be observed with a spiritual nonchalance and complacency but events of vital interest. For a Muslim artist, human personality has supreme value. We, therefore, find that it is the human drama, the human action, which occupies the centre of Muslim paintings. Vast spaces, mountains and valleys, storms of wind and rain which characterize Chinese paintings are conspicuous by their absence in Muslim painting. The principal reason for this attitude seems to be the realization

that for a painting of nature to be vital and vivacious it has to employ human symbols.

The storms must oppress and plunder, the wind must be caught unawares in a tree, the valley must sing songs, and mountains must radiate human, maternal warmth. One cannot enjoy a landscape painting unless it is perceived animistically, unless it is human in some way. Not that Muslim painters did not paint landscapes, they did sometimes far more effectively than the impressionistic painters of France and Holland. What did they eschew, however, was painting a landscape for its own sake. A human being must be there to give actuality to natural scenery. Without human beings nature is dead and insignificant. For Muslim painters a scene of natural beauty is incomplete and incomprehensible with the observer being there in the painting in one form or another. It is a new mode of perception; seeing nature as an inter-play between natural stimuli and the human eye. Western critics of Muslim art do not see this point. They dismiss the entire Muslim painting as sentimental and romantic because it is not interested in nature per se.

3. Muslim painters did not introduce perspective in their paintings. Their paintings seem almost all - except those made in the time of Jahangir under the impact of Dutch and Flemish painters - to be lacking in depth. The third dimension and the changes it causes in human perception are ignored by the Muslim painters. Perhaps the reason is that they are interested in distant objects as well as in near objects. An object far away is as much relevant to the central figure as the object in the forefront. Why not bring it forward in imagination, observe it telescopically at it was and paint it in its full magnitude?

One finds a similar spectacle in some of the illustrations of the Shah Nameh. There in a single painting several episodes are brought together to make a complete story. The Western critic is baffled, and even when he praises such "erratic" paintings he does so condescendingly. The reason he does not understand this style of painting is that he is alien in spirit of the Muslim conception of time. For a Muslim, time and eternity are only two facets of the same reality, he does not have to create a dichotomy between time and eternity, he does not have to make time illusory in order to satisfy his longing for eternity. A Muslim is expected to try constantly to create eternity out of time. No wonder then that Muslim painting tried to combine all dimensions in a single unity and all phases of time in one whole.

4. Muslim painters did not paint darkness. In their painting all is light and colourful. The resplendent sun seems to cover their canvas and paper. There are no dark shades or black shadows haunting the painting like ghosts threatening life with primordial dangers. Their painting is a painting of luminous tints and hues and colours. This again reflects a singularly strange attitude, especially to the Western, for he can wallow in darkness.² Darkness and fondness for darkness are typically pagan characteristics.

It connotes qualities which emanate from a state of pre-consciousness. You cannot be conscious and remain in darkness. Darkness is a dragon which devours distinctions, discriminations, and differentiations. Darkness also characterizes a condition of stark individualism, when the individual is

sundered from society and finds himself in the grip of absolute helplessness. Modern Western sensibility which is completely unconnected with Muslim culture cannot appreciate the absence of darkness. It seeks an external representation of the black despair within. But black individualistic despair was no part of Muslim consciousness.

As we have seen, Islam emphasizes a serious commitment to history. In a growing Muslim society the individual, apart from being an individual, is a social being par excellence. Sociality is a *raison d'être* of an individual. The helplessness of an individual and the resulting spiritual darkness, therefore, is a condition alien to Muslim consciousness. Perhaps, when the Muslim individual is faced with rapid industrialization, he may for a time get into despair and thus enter the realm of darkness in order to emerge again with light. Of course, there were Muslim mystics and they did come at times face to face with the phases of inner darkness, but they were people who never painted.

5. Muslim painting, consciously or unconsciously, employed symbols which represent mystical states. Sometimes endless curves with no beginning or end stand for the state of bewilderment in which nothing outside seems to gratify spiritual longings. At other times mandala³ forms are used to indicate the state of spiritual wholeness which mystics desire to achieve. Western critics do not see these motifs in Muslim art and like to dismiss it as merely decorative and ornamental. Unless one sees Muslim art in its proper historical perspective and imaginatively flows with the stream of Muslim history and ideology, one is not likely to appreciate the significance of this unique idiom.

6. Muslim painting, especially in Iran, was devoted to the expression of a single emotion in one painting. Every detail of the subject was perceived and made use of for an effective rendering of the subtle nuances of that emotion. The trees and flowers were not there to fill a background; they were there to add to the melody flowing from a painting. Most of the Persian miniature paintings are like orchestras in which each object painted contributes to the symphony. This unique characteristic of Muslim painting may have emanated - as Basil Gray suggests - from the mystical and pantheistic tendencies of the Persians, they, perhaps, regarded every object of nature as manifesting God. But a more plausible explanation of this singular quality can, perhaps, be found in the Muslim conception of time.

Muslims regard duration as continuous and eternal, time as discontinuous, universe for them is new at each moment. One continuously hears the sound of *kun ja-yakun*.⁴ For a Muslim artist, therefore, simultaneity of eternity is far more significant than succession of events. The emotional meaning of an object is implicitly contained in the total situation. This attitude is hard to grasp for the Occidental mind. That is why we find that the Western critics of Muslim art, by trying to fit its mode of expression in the pre-conceptions and categories of their own culture, misunderstand and distort the essence of its individuality.

The nearest parallel to this conception is the Chinese conception of synchronicity embodied in their religious classics, such as I Ching. Since each moment is an act of God, the Muslim painter sees every temporal and

spatial situation as somehow transcending serial time and geometrical space. His peculiar perception gives a painting its particular individuality, the fact that his eager vision selects a peculiar array of objects imparts to its uniqueness. But the fact that this array is the manifestation of the Divine gives it an aura of universality. Both particularity and universality are, thus, combined and synthesized in a single work of art.

7. Muslim paintings - again especially miniatures - are illustrations of literary and religious classics. Several explanations of this peculiar characteristic have been advanced. But the only explanation which is consistent with the general Muslim attitude is that for a Muslim nature is itself in illustration of the Word of God. *Kun fa-yakun* are the words which translate themselves into the sensible world. The world is Logos in matter and motion. Muslim consciousness is rooted in the awareness of a profound inter-relationship between word and fact. Word seems to be the life blood of the universe.

This point will become clearer if we attend to a parallel recently drawn by Dr. W. C. Smith between the Christian "Eucharist" and the memorization of the Qur'an by Muslims. Dr Smith writes, "The Koran, in formal Muslim doctrine pre-existent and uncreated is for the Moslem the one tangible thing within the natural realm that is super-natural, the point where eternal has broken through into time. By Koran one means, of course, not the 'ink and paper' but the content of the Koran, its message, its words, ultimately its meaning. The hafiz (freely, the 'memorizer', but, more literally, the 'apprehender') has in some sense appropriated this himself, has interiorized it in a way that could conceivably suggest to a Christian some analogy with what happens when the Christian in the Communion service appropriates God, the super-natural, the embodiment of eternity in time."

This parallel is extremely valuable. For where Christians have to incorporate the body of Christ in order to have communion with the God-head, Muslims have to incorporate the words of the Qur'an so that they would have communion with God. The eternal Word and its meaning are one, they cannot be separated. And it is the Word which gives spiritual sustenance to the believer.

If we look at the artistic illustrations composed by Muslims painters from this point of view, we may appreciate the significance of this tendency better and more adequately. The word for a Muslim has a compelling power of creation: his spirit must fly to eternity on the wings of words. Not only that, these are the only wings which can take him there. Hence, every sensuous experience which inspires a painter to express himself in colour and line, in order to be integrated in his personality, must be capable of verbal expression. The rise and fall of sensuousness must be capable of being regulated by words.⁵

Muslim painting, especially in its early phases, was not an autonomous medium of expression. It was subsidiary to literature. The earliest Muslim paintings were the results of the efforts of painters to illustrate some of the classical books. They derived their content from these books and their form from their need to decorate and make beautiful. The passion to illustrate the written word is not something peculiarly Muslim, it has inspired painters

like Delacroix to illustrate Goethe's Faust and artists like Michelangelo to point Christian myths and legends on the interior walls of cathedrals and churches. It is significant that the grand old man of painting in Pakistan, 'Abd al-Rahman Chughta'i, won his reputation as a great artist by his illustration of Diwan-i Ghalib. When painters, whether of the East or of the West, seek grand visions and cosmic views to colour their artistic endeavours, they illustrate great books. Perhaps the need for these visions is perennial.

Let us now substantiate these points by have a brief a glance at the history of Muslim painting.

C. Historical Background

Muslim painting started its career under the Umayyads, who as rulers and conquerors were mainly without any puritanical disdain for luxury. The palaces they built were expressions of the theme of splendour and richness, which gradually came to dominate all aspects of their lives. One finds the walls of these palaces made beautiful and attractive with paintings inspired by various colourful motifs. About 94/712, the Umayyad Caliph, Walid I, built a desert lodge at Qusair 'Amrah. This romantic palace was decorated by wall paintings representing allegories and various kinds of animals and plants.

The 'Abbasids went further. In their pagan pursuit of imaginative luxury they made the human figure loom large in their paintings. In their paintings girls dance, musicians sing and play on instruments, animals stroll, and birds fly and twitter. These figures are enclosed in circular disks. One finds a resplendent example of this tendency in the palace at Samarra built in the third/ninth century. Side by side with these painting one sees the opposite motif. On wooden boards are painted plants in white, red, yellow, and blue. In these paintings human and animal motifs are absent.

But the early 'Abbasids made their artistic influence felt more in Iran than perhaps anywhere else. Here one sees several palaces decorated with frescoes in diverse styles and various modes of execution. Some of them are only in black and white, while in others all colours are employed to create the desired effect. The black and white paintings portray human movements, while the multi-coloured paintings depict human and diabolical figures, male and female, with and without haloes, heads, busts and dresses. The plaster niches found at Nishapur are made of different designs, but all have the vase or goblet motif; these vases seem to radiate palmettes against a blue background and have a triangular shape reposing on top. Sometimes two magical eyes diffuse a spell over the entire niche. In Egypt, beautiful frescoes were made under the patronage of the Fatimid Caliphs in the fourth/tenth century. They had several themes - geometrical patterns, birds, palmettes moving out of central figures, human beings holding drinking cups in their hands. One also sees the dawn of miniature painting in this period.

D. Book Illustrations

In the seventh/13th century, the 'Abbasids began to patronize illustrations of classical works of science and mysticism. The impetus

probably came from some of the illustrations made by painters in the second/eighth and third/ninth centuries under the influence of Mani, the great Iranian painter. The ‘Abbasids probably employed the Nestorian or Jacobite Christians to illustrate the books they regarded as classics. The main difference in content between the Manichaean illustrations and Muslim illustrations was that the former were mainly representations of religious themes and the latter devoted by and large to making the sciences of the body and the soul sensuously attractive to the human eye. For instance, the Arabic translation of Dioscorides’ *Materia Medica* was illustrated profusely by ‘Abd Allah ibn al-Fadl. Similarly, other books dealing with animals and plants in a scientific manner had their themes illustrated by skillful painters of the time.

The distinctive feature of these illustrations was that they treated of operational themes. They dealt with subjects such as doctors preparing medicines or surgeons doing operations. These illustrations have a very simple style. Rich and powerful colours make the theme throb and pulsate with energy and vivacity, rosettes and palmettes cover and decorate the apparel and garments, but the background is only just indicated, generally with a few conventionalized trees.

One book which was distinguished for its remarkable illustrations was Hariri’s *Maqamat*. Its illustrations were done by a powerful painter of the time, Yahya ibn Mahmud of Wasit, conveniently known as al-Wasiti. This painter copied and illustrated the most important copy of the *Maqamat* in 635/1237. These magnificent paintings deal with everyday life. They show ordinary Muslims travelling in the desert, praying in the mosque, drinking in the tavern, and reading in the library. Their realism is enchanting, their conception is bold, their strokes are sure and vital, and the line they imprint is fine and delicate.

In this period, *Kalilah wa-Dimmah*, a Hindu book of stories, which was translated into Arabic by ibn Muqaffa’, was quite a popular fount of inspiration for the painters who aspired to make their mark as illustrators. One of the manuscripts prepared in 628/1230 show minute observation of details and an excellent realization of the animal motif, but here, as elsewhere, the third dimension is only barely and abstractly indicated. In northern Mesopotamia under the Saljuq Atabegs painting seems to have acquired considerable popularity. Nur al-Din Mahmud, the Urtuq Sultan of Diyar-Bakr, asked al-Jazari, the great inventor, to write a treatise on the work he had done. Several illustrated copies of this book called “Automata” can be seen in the various museums of the world.

In Iran, during this period of history, only wall paintings and ceramics portraying figures and legends in comparatively subdued colours were being made. Turquoise, blue, or white serving as background would shoot forth gold, silver, green, violet, etc.

E. The Mongo School

The Mongols brought with them a deep fondness for the Chinese art. The painters of Mesopotamia, as we have seen, themselves possessed a great sense of realism. This sense was made more acute and sharp by their contact with the Chinese culture and Fine Arts. The Chinese artists had achieved

considerable excellence and maturity in painting landscapes. The Muslim artists assimilated in their idiom not only on themes selected by the Chinese painters but also their method of impressionistic painting in black and white. Ibn Bakhtishu's *Manafi'i al-Hayawan* is the earliest Iranian manuscript of the Mongol times. Several copies of this book were made in different styles, sometimes adopting mild tones and at other times venturing forth in bolder colours.

The most important influence that Mongol painting received in this period was that of a master mind. Rashid al-Din, the man who wrote, among other books, *Jami' al-Tawarikh*, a history of the Mongols, was, above all, a devotee of learning and arts in the pursuit of which he founded a colony of people whose main business was the enrichment of life with knowledge. Several artists, provided with accommodation and amenities of life in that colony, were asked to copy and illustrate books, mainly his own. The miniature painting in all these books - especially those in *Jami' al-Tawarikh* - show a peculiarly sober but fascinating blend of the Iranian and Chinese features of artistic expression. Some of the copies of this book can be assigned to a later period because they suggest developments which occurred only in the beginning of the eighth/14th century.

Quite a few of the painters of this period copied and illustrated Shah Nameh of Firdausi. Again, there are several variations of the composite influences of the Chinese and Iranian styles of painting. The realism of these paintings is particularly marked, the expressions are distinctly individualized, and the details are painstakingly portrayed.

F. The Timurid School

Then came Timur. He was the man who left a trail of blood behind whenever he ransacked a country. Nonetheless, he was a great lover of arts. When he conquered a country he would take special care not to kill the artists. He would then take them to Baghdad, where under his patronage they copied and illustrated manuscripts. But true artistic greatness was achieved only under the inspiring benevolence of Shah Rukh (Timur's son) who made Herat his home. Shah Rukh was interested in books and he inspired many artists to calligraphy and decorate the famous and important books of the time.

Khalil, a great painter, who was regarded second only to Mani, was the leading figure in art at Shah Rukh's Court. Shah Rukh's son, Baisunqur Mirza, founded an academy of book arts with a large staff. Among the important painters were Amir Shahi and Ghiyath al-Din. Shah Nameh was still the fount of themes for the Court painters, but they also addressed themselves to mystical and romantic subjects - such as those found in Nizami's *Khamseh* and Sa'di's *Gulistan* and *Bustan*. The vivid and lyrical imagery of those paintings suggest that the painters modified and changed their style to suit the novel subjects they had discovered. At Shiraz, where an independent school flourished at this time, colours were milder and cooler, and the style, though not vastly different, was definitely less skilful than that of the school at Herat.

Another book, *Diwan-i Jami*, was also a popular source of inspiration for the painters of that period. 'Abd al-Karim of Khwarizm calligraphed and

illustrated Maulana Jami's Diwan at the end of the ninth/15th century. In Samarqand a book on astronomy was also illustrated for the library of Ulugh Beg.

G. The Great Behzad

The Iranian historian Khwandamir wrote thus about Behzad in the middle of the tenth/16th century, "He sets before us marvellous forms and rarities of his art, his draughtsmanship, which is like the brush of Mani, has caused the memorials of all the painters of the world to be obliterated, and his fingers endowed with miraculous qualities have wiped out the pictures of all the artists among the sons of Adam. A hair of his brush, through its mastery, has given life to the lifeless form."

This great painter began his career with Sultan Hussain Mirza at Herat at the end of the ninth/15th century. Later, he came to Tabriz in the early tenth/16th century to work under Shah Isma'il. It has been said that when a battle was raging against the Turks, Behzad and Shah Mahmud al-Nishapuri were hidden by Shah Nasir in a cave. In 929/1522, Behzad was appointed Director of the Royal Library. The two well-known manuscripts that Behzad illustrated were Khamseh and Bustan. One sees in these paintings a keen perception of form, a highly sensitive and subtle sense for colour, experimentation with colours to evolve new Gestalten, and novel patterns of feeling and awareness. These paintings show that Behzad had an astonishingly strong consciousness of the opposites: of dramatic action and immobility, of blending peace and unrest, of combining generality with individuality. Zafar Nameh, a biography of Timur, was also illustrated by Behzad. Besides, he illustrated Maulana Jami's Diwan, and his illustrations show his experimental genius at its best.

The most outstanding student of Behzad was Qasim 'Ali, who carried on the style and artistic tradition, set by his inimitable master. Qasim 'Ali, who acquired the experimental spirit of Behzad, became well known as a painter of faces.

One thing that strikes the modern connoisseur of painting is that Behzad, who unfortunately did not outgrow the narrow confines of miniature painting, had an intense awareness of the mandala. One has only to look at his masterpiece, "The Dancing Dervishes," which, apart from its ravishing curves and powerful lines suggesting movement and rhythm, is a beautiful mandala figure. The dervishes make a moving and dancing circle which seems to revolve around a centre. The centre is again not bereft of content. It is filled with four dervishes dancing hand in hand.

This painting gives a lie to all those Western critics of Muslim painting who have repeatedly charged Muslim art, almost ad nauseam, with being almost entirely decorative. This painting is one of the illustrations in Diwan-i Jami, a Book of poems with a markedly mystical content. Here is a painter who not only illustrates but also absorbs the mystical content in his artistic forms. Mandala represents spiritual wholeness. It seems that Behzad was painting his powerful pictures not to produce decorative effects but to answer a spiritual need. It was a response to his spiritual longing, a colourful realm discovered by his spiritual quest, as answer to the prayers of his soul. When one looks at "The Dancing Dervishes," one finds that compared with

it the most renowned mandala paintings by the mystics of other creeds pale into insignificance. The spell that Behzad's paintings cast on the beholder can radiate only from a whole soul. It is not the work of a mere decorator.

H. The Safawid School

Herat continued to throb with art even when Behzad shifted from there to Tabriz. Behzad's influence was not passing or transitory, it stayed because it continued to move and stir the Muslim soul. Amir Khusrau Dihlawi's *Khamsea* was copied at Balkh and was illustrated by one of Behzad's students. It contained some very significant miniature paintings. The great calligrapher 'Ali al-Hussaini copied and illustrated 'Arif's *Go-i Chaugan* in 930/1523. Similarly, *Diwan-i Hafiz* was illustrated by Shaikhzadeh, a student of Behzad, and Sultan Muhammad who had an individual style. Sultan Muhammad also copied Nizami's *Khameseh* and produced some very outstanding and superb paintings. In his paintings he introduced new colour schemes and new ways of perception.

Sultan Muhammad was a Court painter par excellence. He was not only an intimate and close friend of Shah Tehmasp, but also taught him how to paint. He illustrated Nizami's *Khamseh* and Firdausi's *Shah Nameh*. Along with his teacher Mirak, he created a new style of painting. His fingers are more sophisticated and his background is richer in detail and ornament.

Sultan Muhammad also painted some portraits of charming young men and lovely ladies. Some of his portraits are those of Shah Tehmasp himself.

The second half of the tenth/16th century saw the rise to eminence of another painter, Ustad Muhammadi, son and student of Sultan Muhammad. The miniatures painted by this great artist reveal an enchanting style and a sense of composition unprecedented in the history of Muslim painting. He took his subjects from everyday life and imparted an inimitable rhythm to all the details of his figures. Trees, wild and tamed animals, men and women enter his paintings and become immortally and irrepressibly alive.

I. The Bukhara School

In the early tenth/16th century, Bukhara became the centre of hectic creative activity. Mahmud Madhahhib, a student of the famous calligrapher Mir 'Ali, excelled in painting love scenes. He also illustrated Nazami's *Makhzan al-Asrar*. Several other painters painted miniatures in this century and their work shows the influence of Behzad and his school. But they did not blindly imitate Behzad; they accepted his influence and developed a new style. They experimented with colours and afforded local touch to the figures they made. One painter illustrated Sa'di's *Bustan* and another Muhyi Lari's *Futuh al-Haramain*. One finds these paintings beautiful and decorative, but lacking in the spiritual fire which was characteristic of Behzad's work.

They were bereft of the ardent longings which animate paintings of the Herat school. They are expressions of artistic decay which set in at about this time in Iran and other Muslim countries. The principal reason of this decline seems to be the desire of clinging to the same old form of miniature painting and a refusal to experiment with other media of expression. That is why in Isfahan, under the patronage of Shah 'Abbas, illustrations were made

but only of works of much lower calibre than Shah Nameh or Diwan-i Hafiz. Paintings were made to portray scenes from books like Chihal Sutun and 'Ala Kapi. At this time Rida'-i 'Abbasi were regarded as the most outstanding painter of Iran.

His tinted drawings throb with life and vigour. One finds in them undulating curves flowing with facility into the patterns they weave and mild strokes emphasizing the ends. This was indeed a breath of fresh air. Life itself, rather than books, became the fount of inspiration. This was a great change, but it could not be felt as such because great changes need great artists to sustain them. Unfortunately, neither Rida'-i 'Abbasi nor anyone else had the powerful vision of a Behzad or a Sultan Muhammad. Consequently, the 11th/17th and 12th/18th centuries, people imitated and admired Rida'-i 'Abbasi, but no new movement came into being.

J. The Turkish Painting

The origin and development of Turkish painting is still wrapped in mystery. However, this much we know that in 855/1480 Sultan Muhammad II invited Gentile Bellini to his Court and commissioned him to paint his portrait. In the tenth/16th century Shah Quli and Wali Jan, the Iranian painters, came to Constantinople and became Court painters. These artists selected the houris of paradise as their subject-matter. Shah Quli achieved excellence as a painter of curved leaves and Wali Jan became distinguished for the elegance of his lines. Some Iranian painters illustrated "History of the Ottoman Sultans" and Sulaiman Nameh, a book of stories by Firdausi of Brusa. The main distinction of these painters was that they did a good deal of experimental work in colours.

K. The Mughul Painting

Babur, the first Mughul Emperor of India (933 - 937/1526 - 1530) was a philosopher and great lover of nature. It seems that he patronized Fine Arts and brought with the traditions of Behzad and the Bukhara school. Babur's son, Humayun, invited Khuwaja 'Abd al-Samad of Shiraz and Mir Sayyid 'Ali to his Court at Kabul and asked them to illustrate Amir Hamzah. The paintings they made of this fantastic story were 1400 in number. Akbar, Humayun's son, was a unique patron of arts. He built a city, Fatehpur Sikri, where he decorated his palaces with mural paintings and founded an academy of Arts.

This was an institution for the creation and promotion of a native school of painting. Painters of this school were influenced by Behzad and the early Timurid paintings. Nizami's Haft Paikar was copied and illustrated by the painters at Akbar's Court in a style which had a peculiar blend of two traditions: Behzad School and the early Timurid School. They show a local touch in so far as the content is concerned, but in the selection of colours and design they were markedly Iranian.

Hindu painters, working under the Mughul influence, illustrated manuscripts dealing with the lives and exploits of Timur, Babur, and Akbar. Their paintings reveal a remarkable mixture of the Hindu, Iranian, and European influences. For the first time in Muslim art one notices the presence of perspective and a clear visualization of the third dimension.

Jahangir (1014 - 1038/1605 - 1628) carried on the tradition of his great ancestors, and he carried it much further. He liked art to be representative of life as it is lived in the present and not a mere illustration of the wisdom of books. Thus, in his time realistic painting of plants and animals were produced in abundance. On his travels he would take his Court painter with him and urge to portray significant historical events in their paintings. Mansur, Murad, and Manohar were distinguished painters of his time. These artists painted rare birds, animals, and flowers in an exquisitely realistic style.

Jahangir and his nobles were also fond of getting their portraits made. The famous portrait painters of this time were Bishandas, Manohar, Muhammad Nadir, and Abu al-Hassan. Abu al-Hassan was Jahangir's favourite: he painted some beautiful miniatures and some very fine portraits of Jahangir. Mughul painters also painted pictures representing nobles and princes conversing with Hindu ascetics and hermits. Shah Jahan, Jahangir's son, was a devotee of portrait painting. Some of his own portraits, made by artists at his Court, show acute observation, elegance and subtlety in execution, and a deep sense of colourfulness. Muhammad Fakhr Allah Khan and Mir Hashim were two of the important painters of his time. Dara Shikoh, Shah Jahan's son, who never ruled, was a great admirer and patron of arts - but after him, that is, in the 12th/18th and 13th/19th centuries, Mughul art suffered a complete decline.

Notes

1. "Prayer, then, whether individual or associative, is an expression of man's inner yearning for a response in the awful silence of the universe. It is a unique process of discovery whereby the searching ego affirms itself in the very moment of self-negation, and thus discovers its own worth and justification as a dynamic factor in the life of the universe." Sir Muhammad Ashraf, Lahore, 1958 p. 92.

2. Thus, Bachofen writing about the characteristics of matriarchal societies regards preference for darkness as an important attribute of such pagan cultures. Bachofen says, "By no means less significant is a second expression of the same fundamental law, that of pre-dominance of night over day born of her maternal womb. In antiquity... preference of night over the day (was) associated with ... a dominant maternal influence. In this instance two hoary customs and usages, councils and court assemblies, that is, the preference for darkness for the exercise of social functions, show that we are not dealing with a philosophic theory of later origin, but an actual mode of life. Added to these observations comes the preference of the sinister aspect of life and death over its bright aspect of creation, the pre-dominance of the dead over the living and of sorrow over joy."

3. 'Images of the goal,' says Jung, "are mostly concerned with ideas of the mandala type, that is, the circle and the quaternity. They are the plainest and most characteristic representations of the goal. Such images unite the opposites under the sign of the quaternio, i.e. by combining them in the form of cross, or else they express the idea of wholeness through the circle or sphere."

4. Louis Massignon, "Time in Islamic Thought," Eranos Yearbook, Rhein-Verlang, Zurich, 1951.

5. In a footnote in his paper on Christianity and Islam, Dr. Cantwell Smith writes, "It is the word (Kalam) of God, it is not He nor is it other than He." He further quotes from Al-Nasafi, "We do not say that the verbal expressions (alfaz) and letters are eternal...The (uncreated) Qur'an, the Speech of Allah, does not reside in the hearts, nor in the tongues, nor in the ears, but it is an Eternal idea subsisting in the essence of Allah."

The last line in al-Nasafi's quotations, however, suggests that the Eternal Idea could be grasped without the Word. But this is a mistaken view of Muslim consciousness. In Muslim consciousness the Word is an integral part of the total meaning of God. That is why a Muslim, however rationalistically oriented he might be, will always admire -covertly or overtly - the heroic fight that Imam Ahmad bin Hanbal put up against the doctrine of al-Qur'an khalq1-Allah , that is, the Qur'an is the creation of God.

One may agree with Dr. Smith when he writes, "By this act (i.e., memorizing) the Moslem is, as it were, taking the gift of God up off the book and paper in which it is enshrined and incorporating it within himself, so that it becomes for him alive and inalienably personal." It is quite true that the spoken word which is incorporated in the personality of the memorizer (hafiz). After all, the Qur'an descended as the spoken word of God.

Chapter 57: Music

“To some people music is like food, to others it is like medicine, and to others like a fan.”

Alf Lailah wa Lailah

These prefatory lines, serve as they do to provide a text on the lintel of the doorway to this subject, reminds one how widely dissimilar is the attitude of Islamic peoples towards the art and practice of music to that of others; music is indeed “like food,” since it often sustains when all else fails. You can scan Greek literature in vain for any such parallel sentiments. Music in its literal connotation was alien to Greek philosophy.

Aristoxenus certainly dealt with it, but his approach, devoid of the slightest hint of philosophic appeal per se, was a purely scientific one.¹ It is true that the Pythagoreans had given a foretaste of the Islamic spiritual conception of music, but that was in the dim and distant past of Greece. What is more in keeping with the Greek evaluation of this art is to be found in Athenaeus of Naucratis (fl. 200 A. D.), whose utterances are mere entertaining chatter.²

A. The Music in Itself

“This art...is the foraging ground of audition, and the pasturage of the soul, and the spring grass of the heart, and the arena of love, and the comfort of the dejected, and the companionship of the lonely, and the provision of the traveller, because of the important place of the beautiful voice in the heart and its dominating the entire soul.”

Ibn ‘Abdi Rabbihi, al-‘Iqd al-Farid.

After reading the prologue to this chapter, one cannot help realizing how vastly different are the sentiments of Islamic peoples from those of the peoples of Greece and Rome on the assessment of music. And by music we mean that art which the noblest minds in Islam believed to be capable of being informed with and ennobled by thought, and in turn to adorn and enforce thought, and to be thus understood and felt. No better example of that percipience is to be found than one in the utterances of the Ikhwan al-Safa of the fourth/tenth century of Basrah, the home of the learning, who spoke of music as “an art compounded between the corporeal and the spiritual.”³

To these transcendental philosophers “all the arts had bodily forms except the art of music, whose substance was a spiritual essence.” With what felicity do the “Brethren” laud that type of music “which softens the heart, brings tears to the eyes, and makes us feel penitent over past misdeeds.” How well they knew the value of those soothing melodies “that lightened the pain of disease and sickness,” and those affecting airs which “comforted the aching hearts and eased the grief of the afflicted in times of calamity.” More practical still was their recognition of those songs “that relieved the toil of heavy work and wearisome undertakings,” as well as that music which gathered “joy, pleasure, and happiness...at weddings and banquets.”⁴ Indeed a veritable ocean of literature in praise of music has flowed down to us from the Islamic past, whilst poets have sung the sweetest verses in adulation.⁵

On the other hand, there have been many pious and honourable men among the legists (fuqaha') who have considered music a useless pastime (lahw) which sometimes became an urge to commit actions which were unlawful (haram) or abhorred (makruh). Among those who condemned divine art were some of the most sincere of the Muslims, from ibn Abi al-Dunya (d. 281/894) in his "Censure of Forbidden Pleasures" (Dhamm al-Malahi),⁶ to Shihab al-Din al-Haithami (d. 973/1565) in his "Restraint of Impetuous Youth" (Kaff al-Ra'a').⁷ Nobody can censure those opponents of music who sincerely believed that it was among the things prohibited (muharramat), since even Christian Europe linked "wine, woman, and song" among the "idle pleasures" (malahi).

Yet, strictly speaking, the objections of the purists in religion to "listening to music" (al-sama') has no logical raison d'être. Calligraphy cannot be blamed on account of forgers, nor can accountancy be condemned because of defalcators. It would be just as illogical to forbid fruits and viands because of their concomitance with wine and woman as to censure music owing to its proximity to the latter. Music, per se, is neither good nor evil, although it may accompany both, yet it cannot be categorized or submitted to predicament.

In spite of all our probing and searching we still do not know the inner causes of emotion. Al-Farabi (d. 339/950) denied that music inspired a passion or soul-state.⁸ His guess was that music, whether in the performer or the listener, was itself inspired by a passion or soul-state. Ibn Zailah (d. 440/1048) held much the same view. He says, "When sound (saut) is adorned by harmonious and mutually related composition, it stirs the soul of man...Beginning on a low note and ascending to a high note, or vice versa, according to a particular arrangement and a known composition, it becomes related to the sentiments of the soul of man. As one note (naghmah), after another changes in the music, one state after another changes in the soul.

One composition will transport the soul from weakness to strength, and another from strength to weakness...Therefore, the composition which is possessed of certain sounds is possessed of certain qualities by which the soul is influenced."⁹ All that is manifest to the meanest observer, but no one has yet told us what those "qualities" are. Fakhr al-Din al-Razi (d. 606/1209) states a more "up-to-date" opinion, and this, in substance, is what he has to say, "In the animal world sounds come into existence by reason of grief, pain, or joy. Those sounds, according to these circumstances, are different, being high or low, so, the law of association, those sounds become bound up with the different mental states which prompt them. Thus, when those sounds are renewed, they inevitably call up the related mental states, which may be grief, pain, or joy."¹⁰

From the purely Islamic point of view, ibn Zailah also raises a point worth mentioning. He says, "Sound produces an influence on the soul in two directions. One is on account of its special composition (i.e. its physical content), the other, on account of its being similar to the soul (i.e. its spiritual content)."¹¹ A Persian mystic, al-Hujwiri (fifth/11th century), divides those who listen to music into two categories: those who listen to the material sound and those who hear the spiritual meaning. That ecstatic

maintained that those who heard spiritually did not apprehend mere notes (naghamat), modes (maqamat), or rhythms (iqa'at), but music per se, insisting that such audition "consists in hearing everything as it is in quality and predicament."¹²

That doctrine takes us to the very core of Sufi teaching in which "listening to music" under such spiritual control conduces to ecstasy, which leads to a revelation of the Divine. Did not Schopenhauer suggest that the world itself is but music realized, and was not that what the Ikhwan al-Safa had taught a thousand years earlier?

Yet of all the great thinkers of Islam no one has probed to the heart of the problem with such power of persuasion and solicitude of purpose, and reached a conclusion of such profundity as al-Ghazālī (d. 505/1111). How penetrating are his words, "Hearts and innermost thoughts are mines of secrets and treasuries of precious stones. Within their confines are jewels which are as sparks contained in iron and steel...And there is no other way of extracting their secrets except by the flint of 'listening to music' (al-sama'), because there is no means of reaching the hearts except through the portals of the ears."¹³ ...Verily, 'listening to music' is a factual touchstone,... for as soon as the soul of music reaches the heart, it brings out whatever predominates in it."¹⁴ That was also the dominating thought of Abu Sulaiman al-Darani (d. c. 205/820), who averred that "music and singing do not produce in the heart that which is not in it."

As our opening lines from the *Alf Lailah wa Lailah* reveal there is much more in music than its being merely an ancillary to those things which are unlawful and abhorred, and those who base their objection to music on the Holy Qur'an and the Hadith must know that they can be answered by proofs to the contrary from these identical and revered sources.¹⁵ Ibn Khaldun (d. 808/1406), the greatest of the philosopher-historians of Islam, did not touch directly on the question of al-sama' in the legal aspect. We do not know his reasons for that apparent neglect, but the fact that he devotes a chapter in his *Prolegomena to music* is sufficient proof of his attitude, which was that of the rational man.

To him, man was a social animal who was good by nature.¹⁶ It follows, therefore, that man should seek to satisfy certain natural desires in his leisure hours, such as the need for healthy relaxation, the wish to acquire knowledge, and the urge to listen to sweet music.¹⁷ All such longings were perfectly reasonable, and since man could discern what was good or evil in those desires, he could, by experience, make such desires always beneficial both socially and spiritually, provided the intention in those desires were good. If that were the case, the desires were lawful.¹⁸

The Sufi and the darwish have eloquently defended their attitude in the usage of music in their ceremonials by proofs that are unanswerable by its condemners. Perhaps the most trenchant defence was made by the brother and successor of the great al-Ghazālī, who was known as Majd al-Din al-Tusi (d. 520/1126), and this is what he said, "If anyone says that audition is absolutely unlawful, he has declared forbidden in the law that about which no statute has come down, since no statute forbidding audition and dancing has come down in the Book of Allah, or in the usage of Allah's Apostle, or

in the words of the Companions (of the Prophet). And he, who declares to be forbidden in the Law anything which is not in it, has invented something against Allah, and he who invents anything against Allah is an infidel by general agreement.”¹⁹

Yet we, in this work, are primarily concerned with the purely secular approach, although it may unavoidably include that which is divine. Not only is the case for secular music unassailable, but the teaching, acquisition, and practice of it can be proved to be rational since it affords healthy exercise to the body, mind and emotions. It has been said that “men die for want of cheerfulness as plants die for want of light.” And, what can supply that want better than music? Therein is refreshment for the body, cheer for the mind, and relief for the emotions, or, more grandiloquently, the repairing of lost energies, the soothing of chafed sensibilities, and the kindling of finer feelings and aspirations.

Everybody knows, especially in Islam, the wondrous power of the “beautiful voice,”²⁰ particularly in the reading (qir’ah) of the Qur’an and the chanting of the “call to prayer” (adhan). They give back musical impressions which not only delight the ear but thrill the soul, because that chanting harmonizes with the divine message.²¹ And why should not secular music per se do likewise, since there seems to be a natural alliance between radiant music and moral beauty? Surely man’s faculties and susceptibilities for the acquisition and enjoyment of music were not bestowed but that they should be a glory to the Giver and a joy to the possessor, for they are as essential to the social and spiritual welfare of man as the influence of the sun and rain is to be the fruitfulness of the mother earth.

“Get way from evil and sing”
(Ab’id al-sharr wa ghanni).

Syrian Proverb

B. The Music Lovers

“I like the man who cultivates poetry for self-instruction, not for lucre; and the man who practises music for pleasure, not for gain.”

Ibn Muqlah (d. 238/940)

Since Islam was born among the Arabs and was cradled in the Hijaz, one must give prior consideration to these two important facets. In the “Days of Ignorance” (al-jahiliyyah) music was practiced in the whole of Arabia by the matrons of the towns and tribes as well as by professional singing-girls (qainat). These not only cheered many a home and encampment, but strengthened the resolve of those in the battle throng, as we read in the Hamasah. Their singing (ghina’) was based on a simple type of song called the nasb which was but an improved form of camel-driver’s chant (huda’). They accompanied themselves on an instrument of strings (muwattar), although more generally it was a harp-like instrument (mi’zafa), a percussion wand (qadib), or a tambourinte (mizhar).²²

In default of the latter they could adapt the perforated skin sieve (ghirbal) for that purpose: this received the approval of the Prophet later.²³ When Islam came upon the world of intellectual darkness, the first male musician to make history was Tuwais (d. c. 88/705). He accompanied himself on a

square tambourine (daff), and when performing would perambulate along the lines of his audience.²⁴

The wide conquests of the Arab armies, notably in Persia and Syria, had sent crowds of captives into the towns of the Hijaz. Among these were singers and players whose alien types of music captivated the people of Mecca and Medina. The result was that Arab musicians found themselves compelled to master the new kinds of singing and playing. That was only one of the many cultural influences which affected Arabian modes of life, for “when the revelations of the Prophet flashed on the world, a message was delivered which could not be confined to the Hijaz, the cradle of Islam. As a result, the banner of the Prophet was planted eastward at the extremities of Transoxiana, southward by the banks of the Indus, northward to the shores of the Black Sea, and westward on the slopes of the Pyrenees.”²⁵

As we march through the pages of the history of music we shall see how manifold artistic ingredients contributed to Islamic civilization. Al-Hirah, the capital of the Arab Lakhmids, had already imbibed much of Persian culture including the lute (‘ud).²⁶ The Meccans had used a rustic type of pandore (mi‘zaf) which had a parchment “face” (wajh), but as the Persian lute (barbat) had a “face” of wood, the Meccan lute was called the ‘ud (wood). The holy cities of the Hijaz resounded with strains of music and song,²⁷ and the artistic career of the songstress ‘Azzat al-Maila’ (d. c. 88/705) in the Hijaz attested to that fact.

At her auditions the greatest musicians, poets, litterati, and the most distinguished citizens, including ‘Abd Allah ibn Ja‘far, a cousin-germain of the Prophet, took part. Even Hassan ibn Thabit, the first poetic extoller of Islam sang her praises.²⁸ Among the great musicians of the glorious days of the Orthodox Caliphs (al-rashidun) were Sa‘ib Khathir (d. c. 83/683), Hunain al-Hiri (d. c. 100/718), and Ahmad al-Nasibi, a kinsman of the poet A‘sha Hamdam (d. 82/701).²⁹

The Umayyad caliphs removed their capital from Medina to Damascus, where their Courts, with the exception of that of ‘Umar II (d. 101/720), were thronged with singers and players. Of al-Walid (d. 126/744) it was said that “the cultivation of music spread not only among the leisured class, but with the people also.”³⁰ Those were the flourishing days of the great virtuosi whose names adorn the pages of Islamic history, notably ibn Muhriz (d. c. 97/715), ibn Suraj (d. c. 108/726), al-Gharid (d. c. 106/724), and Ma‘bad (d. c. 127/743), usually dubbed as “the four great singers.”³¹ Such was Islam, the territories of which knew no racial boundaries, which those four musicians were foreigners by blood, the first being of Persian origin, the second of Turkish descent, the third and fourth claiming respectively Berber and Negro extraction.³²

Because of such a large-hearted tolerance of racial differences it is quite explicable why the hybrid and exotic in music became an allurements and fascination. Through Islam the technical nomenclature in music was almost wholly Arabic, and that was still the case when the first Persian treatises on music appeared in the eighth/14th century.³³ Still, the Arabs borrowed the Persian chang (harp) which they confusedly called the sanj and jank. They

also adopted the Persian tuning (taswiyyah) of the lute, and the frets (dasatin) on the neck of the instrument.³⁴

When the first of the ‘Abbasid Caliphs, al-Mansur (d. 158/755), built that wondrous city of Baghdad, it soon became not only the capital of the vast dominions of the Caliphate, but the cultural centre of Islam. The early ‘Abbasid period has well been styled “the Augustan Age of Arabian literature,”³⁵ although an even greater encomium could be justly used in respect of music during that era, if we take the golden pages of the “Great Book of Songs” (Kitab al-Ahani al-Kabir) as our authority. The first outstanding ‘Abbasid minstrel was Hakam al-Wadi (d. c. 180/796), a singer and performer who carried all before him.³⁶

Almost as exquisite were the vocal accomplishments of ibn Jami‘ (d. c. 189/804).³⁷ He had been taught by the doyen of the Court minstrels, Yahya al-Makki (d. c. 215/830), the fountain head of the old music of the Hijaz. Indeed his “book about the Songs (Kitab fi al-Aghani) was a repository of the classical art;³⁸ his son Ahmad (d. 250/864) issued a revised edition of 3,000 songs³⁹ Greater still was Ibrahim al-Mausili (d. 189/804) who outshone all others by his versatility. Nine hundred compositions stood to his credit, whilst his training school for singing girls became renowned.⁴⁰

Fulaih ibn Abi al-‘Aura’ was another favoured singer, being the only one allowed to appear - professionally - without the customary curtain (sitar) which screened the musicians from the Caliph. Fulaih, with Ibrahim al-Mausili and ibn Jami‘, compiled a collection for Harun al-Rashid known as “The Hundred Chosen Songs” (al-Mi‘at al-Saut al-Mukhtarah).⁴¹ Prince Ibrahim ibn al-Mahdi (d. 224/839)⁴² and his step-sister Princess ‘Ulayyah (d. 210/825)⁴³ had both been carefully trained in music at the instance of Caliph Harun, at whose Court music received so munificent a patronage that it set the whole world in wonderment.

Prince Ibrahim possessed a voice with a compass of three octaves, and was considered the “most proficient in mankind” in that art.⁴⁴ By that time the impingement of Persian and Khurasanian novelties in music became quite pronounced. Singing girls from Khurasan were “the rage.” They performed on a long necked pandore (tanbur) which gave an alien scale, whilst the Persian lute produced a scale that was dissonant to the Arabian system, as we shall see in Section C. Prince Ibrahim and his henchmen favoured these exotic ideas, and even applauded the open violation of the recognized patterns in both the melodic and rhythmic modes.

This defiance of the old classical procedure divided the Court minstrels into two camps, viz. the “Romanticists” led by Prince Ibrahim, and the “Classicists” headed by the chief Court minstrel Ishaq al-Mausili (d. 235/850), the most famous of the musicians of the Muslim world.⁴⁵ Against those neoteric fancies, Ishaq took a firm stand, and eventually was able to re-establish the old Arabian scale and modes, which seem to have been set down in his “Book of Notes and Rhythm” and his “Great Book of Songs.”⁴⁶

After the mid-third/ninth century, the Baghdad Caliphate began its political decline, although music still prospered at its Courts. Al-Mutawakkil (d. 247/861) gave constant encouragement to that art. His son, Abu ‘Isa ‘Abd Allah, was an accomplished musician and a composer of

some 300 songs.⁴⁷ Al-Muntasir (d. 248/862) was both a poet and a musician; the words of his songs have been preserved in al-Isfahani who devotes a chapter to him.⁴⁸ Another such devotee was al-Mu‘tazz (d. 255/869), whose songs have also been saved for us.⁴⁹ His son, ‘Abd Allah, was a highly gifted musician who penned a “Comprehensive Book on Singing” (Kitab al-Jami‘ fi al-Ghina’), the first of its kind, although Prince Ibrahim too, had written a “Book on Singing.”⁵⁰

Yet if the Court minstrels did not produce virtuosi of the same class of old, that defect was overcome by their pens, notably by ibn Tahir al-Khuza‘i (d. 300/913) who wrote a “Book about the Modes and the Reasons for the Songs” (Kitab fi al-Naghama wa ‘Ilal al-Aghani),⁵¹ Qurais al-Jarrahi (d. 326/936) in his “Art of Singing and Stories of the Sinbers” (Sina‘at al-Ghina’ wa Akhbar al-Mughanniyyin), Jahzat al-Barmaki (d. c. 328/938) who published a “Book of Pandorists” (Kitaqb al-Tanburiyyin), and the great al-Isfahani who produced “The Propriety of Listening to Music” (Adab al-Sama‘).⁵²

Turning to the west, we see the same high cultural uplift in Muslim Spain as in the home of the Eastern Caliphate. After the Arabs and Berbers had conquered (91/710) the Iberian Peninsula, a vast portion of the land was held by them until the year 479/1086 and during that period, especially under the Umayyad rulers, music and all the arts were cultivated ardently. Singing girls, called jariyyat, were in great demand, and schools for their training had been established.⁵³ Yet those who came from the East were especially favoured, such as the famed lutanist ‘Afza’ at the Court of ‘Abd al-Rahman I (d. 172/788),⁵⁴ while al-Hakam I (d. 206/822) was especially proud of ‘Uklun and Zarqun.⁵⁵

His chief male minstrels were ‘Abbas ibn Nasa‘i and Mansur al-Yahudi.⁵⁶ Concerts were the “order of the day.”⁵⁷ At the palace of ‘Abd al-Rahman (d. 238/852), there arrived in the year 206/821 the world famous Ziryab, who was treated with unheard-of esteem, for he had been taught by Ibrahim and Ishaq al-Mausili in Baghdad. He was credited with knowing 10,000 (1,000?) songs by heart, and for being the equal of Ptolemy in his knowledge of music. It was he who added a fifth string to the lute, linking it - in the cosmic system - with the soul. The musical system in al-Andalus was that of the Arabian east, the scale being the Pythagorean. Ziryab’s music school - which had some reputation - was carried on after his death by his descendants, and was still flourishing in the days of the “Party Kings,” while traces of it could be found in North Africa in the eighth/14th century.⁵⁸

Under ‘Abd al-Rahman III (d. 350/961) we have an anomalous situation of the Court outwardly condemning music - so as to placate the Maliki legists who frowned on music - but inwardly patronizing it, since he encouraged his children not only to dabble in the art, but to rise to virtuosity. One of them excelled on the pandore (tanbur) and guitar (kaitarah),⁵⁹ whilst another, Abu al-‘Asbagh, said that so long as Allah permitted birds to sing he would do likewise.⁶⁰ In the reign of al-Hakam II (d. 366/976) concerts became special events,⁶¹ and under al-Mahdi (d. 400/1009) orchestras of a hundred lutes (idan) and as many reed pipes (zumar) could be heard in the

palace salons.⁶² Those were the brilliant days of ibn ‘Abdi Rabbihi (d. 328/940) who, in his *al-‘Iqd al-Farid*, gave Muslim Spain some idea of the greatness of the music of the Eastern Caliphate. He was a veritable treasure-chest of Andalusian poetry and song.⁶³

We know little of Persian music in those early days save what may be gleaned from the *Muruj al-Dhahab* of al-Mas‘udi (d. c. 345/956), who quoted ibn Khurdadhbih (d. c. 300/912).⁶⁴ As we have seen, both Persia and Arabia borrowed from each other in matters musical, and we know that Persian as well as Arabian music was being taught at Rayy in the time of Ibrahim al-Mausili.⁶⁵ Certainly there were several brilliant writers in music in Baghdad who were of Persian origin, notably al-Sarakhsi (d. 286/899)⁶⁶ ‘Ubaid Allah ibn ‘Abd Allah ibn Tahir (d. 300/913),⁶⁷ and Zakariya al-Razi (d. 313/925).⁶⁸ A famous singer of the Tahirid period was Ratibah of Nishapur,⁶⁹ and so also was the renowned Rudagi - patronized by the Samanid Nasr II (d. c. 331/942) - a lutanist and harpist, as well as a singer and poet.⁷⁰

Most of the contemporary poets, such as al-Mi‘mari of Jurjan and al-Daqiqi of Tus, sang in rapturous praise of music.⁷¹ Persian music percolated everywhere, Turkomanian influence also made itself felt. The Caliph’s praetorian guards at Baghdad and elsewhere were made up of men of Turkoman race, and they dominated in most things. In such circumstances it can be well understood how Turkomanian music, especially on the instrumental side, was highly appreciated. A lute-like instrument called the *rud* was favoured by them, and an arch-lute the *shahrud*, invented by Khulais ibn al-Ahwas of Samaraqand about 306/918, had already spread to Iraq, Syria, and Egypt.⁷²

In Egypt under the Tulunid and Ikhshidid rulers of the third/ninth and the fourth/tenth centuries, Turkoman influence spread by leaps and bounds, and music was enjoyed by all. Ibn Khallikan praises the excellent voice of ibn Tulun when chanting the Qur’an, while his son Khumarawaih actually adorned his palace walls with pictures of his singing girls.⁷³ The art rose to greater heights under the next rulers. Al-Mas‘udi delineated a delightful scene at a palace by the Nile in 330/940 in which the “sounds of music and singing filled the air.”⁷⁴ Kafur (d. 357/968) was devoted to music and was liberal-handed to its professors.

What was this music of Islam, entralling sounds of which charmed all ears from Bukhara in the east to Cordova in the west? Obviously, there were linguistic differences and indigenous musical preferences in so vast a region. Yet Islam, because of its universal outlook, had leavened some of those diversities. Basically, the scale of all was the Pythagorean, as we shall learn presently.⁷⁵ Yet Arabic technical terminology seems to have had dominion everywhere, as one sees in the term *maqam*. Unmistakably, Baghdad was still the artistic and literary centre, for even Abu Bakr al-Katib, who served the Samanid Isma‘il ibn Ahmad (d. 295/907), saw in Iraq “an ocean of learning and a mine of culture.”⁷⁶

If one scans the *nisbahs* of the great men of literature, science, art, and music who sought Baghdad to win fame and fortune, it becomes clear what a magnet the “City of Peace” had become to the world of Islam.⁷⁷ To the

Arabic-speaking peoples, vocal music was the peerless art. Part of that was due to the beauty of the language, plus the allurements of its variegated metres. The outstanding vocal piece was the ode (qasidah). Within its folds a singer could decorate the melody of each verse with endless embellishments (tahasin). Less classical, but far more popular was the ballad (qit‘ah). There were also folk songs of the mawal type, and we know that even the Caliphs enjoyed the simple songs of the people.⁷⁸

The accompanying instruments were generally the lute, pandore, flute (qassabah), or reed pipe (zamr), which played the simple melody, whilst the rhythmic accompaniment was furnished by a tambourine or drum. Purely instrumental items were also featured, especially as interludes between vocal items. When these were combined the performance was termed a naubah.⁷⁹ Although we read occasionally of a hundred or so performers at Court functions, such events were for special display. The ideal in ‘Abbasid days when listening to music was what Europe would term “Chamber music.” Two other instruments, which had independent usage were the psaltery (qanun) and the rebec (rabab). The former was a special solo instrument, whilst the latter was often used to accompany the chanted verse of poets, which had been its function in pagan days.

Since Arabic was still the language of the “classes” in Persia, one imagines in which much has passed from the immaculate and indefectible in Arabic poetry and song was heard in Iranian lands as late as the fourth/tenth century, notably under the Saffarids and Samanids. The Persians, less intrigued by the lengthy Arabic ode (qasidah), produced a pure love song (ghazal) and the quatrain (ruba‘i), one class of the latter, the ruba‘iyy taranah, showing its musical adaptation. The melodic modes in Persia were far more numerous in different tonal structures than those of the Arabs and they retained their older fanciful names such as ‘ushshaq, Isfahan, salmaki, etc. although most of them had scalar affinities with the Arabian finger modes (asabi‘). Their most favoured instruments were the harp (chang), pandore (tanbur), lute (barbat), double chested lute (rabab), spiked voil (kamanchah), flute (nay), and tambourine (da‘irah).

The Baghdad Caliphate had gone into the protective custody of the Persian Buwaihids (320 - 404/932 - 1015), at whose palaces - as well as at those of the Caliphs - music was subventioned with liberality. In fact, the regime of ‘Izz al-Daulah was condemned because of its infatuation for music.⁸⁰ ‘Adud al-Daulah was more discreetly interested in the art.⁸¹ However, the power of the Baghdad Caliphate - both politically and culturally - was gradually slipping away, and the centre of Islamic culture passed meanwhile to the Fatimids of Egypt. Here Amir Tamim, the son of al-Mu‘izz (d. 365/975), was absolutely appassioned of music,⁸² and no less could be said of al-Zahir (d. 427/1036), who spent fabulous gold on minstrels.⁸³

The Persian traveller Nasir-i Khusrau wrote about the splendour of the Fatimid military bands a little later.⁸⁴ One of its famous men, al-Sadafi, better known as ibn Yunus (d. 399/1009), wrote a book the title of which sparkles with delight. It was called the “Book of the Unanimities and Felicities in the Praises of the Lute” (Kitab al-‘Uqud w-al-Su‘ud fi Ausaf al-

‘Ud).⁸⁵ Another, great historian, al-Musabbihi (d. 420/1029), compiled a book of “Selected Songs and Their Significance” (Mukhtar al-Aghani wa Ma‘aniha).⁸⁶ We still discern the Turkomanian pressure on Egypt’s music, due to the crowd of men from the Qirghiz steppes in its army, and that was only one facet of the “new phase of culture” which arose in Egypt in those days.⁸⁷

Although Muslim Spain had “advanced with incredible swiftness to a height of culture that was the envy of Europe,” the break-up of the central government and the rise of the “Party Kings” halted the progress of the arts for a time. Yet here and there were some hallowed spots of culture. Indeed, a few of these “Party Kings” (muluk al-tawa’if) ‘made their Courts the homes of poets and minstrels,” as al-Maqqari testifies. The last of the ‘Abbasid kings of Seville, al-Mu‘tamid (d. 484/1091), was not only a distinguished poet, but a singer and a lutanist, as was his son ‘Ubaid Allah al-Rashid.⁸⁸ The song-poems of ibn Hamdis (d. 527/1132) were the delight of the Sevillians. When the Almoravid Berber hordes from the Maghrib suppressed the “Party Kings,” music came to be looked upon as one of the “wiles of Satan,” although the older Muslim inhabitants took little heed of such rebukes.

Their successors, the Almohades, under the fiat of ibn Tumart (d. 524/1130), made decrees against music more stringent, even to the destruction of instruments. Yet there were many who opposed these fanatical legists, including ibn Quzman (d. 555/1160), the song-writer par excellence, who chided with puritans saying, “The faqih cries ‘Repent’; but how can one be contrite with the air so fragrant, the birds warbling, the flowers perfuming, and music (ghina) from a clever reed-piper (zamir) and a heavenly voice?” Yet, in spite of fulminations, music and songs were heard on every side.

The newly fashioned zajal and muwashshah were so easy to set to melodies that the same tune would be adapted to different words, as ibn Quzman tells us, and songs spread like the wind in the matter of months as far afield as Baghdad, as ibn Sa‘id al-Maqhribi (d. 685/1286) avers.⁸⁹ Among the best known Andalusian composers were Abu al-Hussain al-Hamrah al-Qarnati and Ishaq ibn Sim‘an al-Qartabi. The highest in the land were enchanted by the art. Ibn Bajjah (d. 533/1138), according to ibn Khaqan, “spent his life singing and playing,” whilst a celebrated physician Yahya ibn ‘Abd Allah al-Bahdabah, wrote zajals for the accompaniment of wind instruments.⁹⁰

Returning to the hub of Islam, we find that the Saljuq Turks had irrupted into the land, Baghdad having been entered in 447/1055. Their rulers took charge of the Caliphs, and they and their later atabegs controlled the world of Islam from the borders of Afghanistan to the frontiers of Greece. All of them were keen lovers of music, and the favoured minstrel of Sanjar (d. 552/1157) was Kamal al-Zaman, whose cognomen indicates his renown.⁹¹ Further east the Ghaznawids and Ghurids were patronizing minstrelsy at their courts. Mahmud of Ghaznah (d. 421/1030) had the poet Farrukhi as his panegyrist, who was also a “skilful performer on the harp” (chang).⁹²

Among the Ghurids of Afghanistan and Hindustan, especially at the Court of Ghiyath al-Din ibn Sam (d. 599/1200), music was encouraged bountifully.⁹³ Greater still was the favour shown to the art by ‘Ala al-Din Muhammad (d. 617/1220), the Shah of Khwarizm, who gave Fakhr al-Din al-Razi protection.⁹⁴ In Baghdad the chief minstrel of the Caliph al-Musta‘sim (d. 656/1258) was Safi al-Din ‘Abd al-Mu‘min (d. 693/1294). His greater fame is as an author notably for his “Book on Prosody” (Fi ‘Ulum al-‘Arud w-al-Qawafi w-al-Badi‘), but greater still for his two books on the science of music which brought him world renown.⁹⁵ In the year 656/1258, the Mughul conqueror Hulagu, invaded the famous city of Baghdad, the centre of the world of Islam, and captured it. Ibn Khaldun avers that 600,000 inhabitants were slaughtered, including the Caliph and his family, and although Safi al-Din was spared because of his eminence as a musician, scholars and litterateurs were massacred as cruelly as libraries, colleges, and palaces were destroyed.

These Mughul barbarians, who had become masters from the borders of Egypt to India, were converted to Islam, and, softened by its culture, they made music one of the delights of their Courts, and the murdered Caliph’s minstrel, Safi al-Din, passed into the service of the Mughul vizier Shams al-Din al-Juwaini. Ibn Taghribirdi tells us that Abu Sa‘id (d. 736/1335) “cultivated music, played well on the lute, and composed songs,” and ibn Battutah (d. 778/1377) describes the royal galley at Baghdad, flanked by boats filled with musicians and singers.⁹⁶ By this time Persian, not Arabic, had become the language of art and science in the Middle East, and from Persian works we are able to see what types of instruments were in vogue.

In addition to the older lute and pandore was a new arch-lute (mughni) and a rectangular psaltery (nuzha), together with a Turkoman viol (ghishak), whilst the pandore was more particularly described as a two-stringed (dutar) or a three stringed (sitar) instrument.⁹⁷ It was Egypt alone that offered a stubborn resistance to the Mughuls, and its Mamluk Sultans, like their predecessors, the Ayyubids, favoured music and song. Here the muwashshah, had been popularized by ibn Sana’ al-Mulk (d. 608/1211) in his Dar al-Tiraz, and al-Saruji (d. 693/1294) bettered the instruction as a song-writer, while ibn Mukarram (d. 711/1311) edited a collection of older songs which had wide acceptance.⁹⁸

Al-Nuwairi (d. 732/1332) also devoted much attention to the subject in his Nihayat al-Arab.⁹⁹ It was the Sultan Qala’un (d. 689/1290) who built the hospital (maristan) at Cairo, where “music soothed the wakeful hours to the sufferers.”¹⁰⁰ An outstanding feature of the Bahri and Burji Mamluk Sultans was their military bands,¹⁰¹ which opened the eyes of the Crusaders to the value, both tactically and musically, of martial music.¹⁰²

Sind had been conquered by Muslim armies as far back as the year 92/711, but it was with Ghurids of Afghanistan that modern Pakistan had its real foundation 571/1175 at the hands of Muhammad Ghuri (d. 602/1206). Here, the powerful fuqaha’ were able to enforce views in condemnation of music upon Iltutmish, the Sultan of Delhi (d.633/1235), who, later, having been impressed by the sama’ of the Chishti darwish fraternity, soon abolished that ban against the art, when the plaintive chanting of its

qawwals became a distinctive feature throughout the land, as we know from the *Siyar al-Auliya'*. Secular music was openly encouraged by Firuz Shah I (d. 634/1236), and the *Tabaqat-i Nasiri* says that his bounty to musicians led him to be called "a second Hatim."

Under Balban (d. 686/1287) one evening per week was devoted to audition of music. The succeeding Khalji Sultans, the first of whom was Firuz Shah II (d. 696/1295), were all music-lovers. At the Court of the latter were Hamid Rajah, Nasir Khan, and Muhammad Shah Hutki, all noted musicians, although the greatest of them all was Amir Khusrau (d. 725/1325), who was "no less notable as a musician than a poet." He had served at the Courts of the two preceding Sultans. In his *Qiran al-Sa'dain*, he has described the Court music of his time. In the *I'jaz Khusrawi*, he tells of the rivalry between the Khurasan and Hindustan minstrels at Court. It is said that a fusion between Persian and Indian music was brought about by him, and in the book called *Rag Darpan* many novelties in music are attributed to him.

Music was still to the fore with the Sayyid dynasty, and Mubarak Shah II (d. 837/1433) was deeply attached to the art. On the elevation of the Lodhi Sultans to the throne in 855/1451 there was a change of attitude towards music. Yet Sikandar II (d. 923/1517) employed four exceptional performers on the harp (*chang*), psaltery (*qanun*), pandore (*tanbur*) and gourd-lute (*bin*), only the last named instrument being of indigenous origin. In the extreme north the kings of Kashmir were ruling a famed "land of song" since 735/1334. Among the most cultured of them was Zain al-'Abidin (d. 872/1467), during whose reign music schools were established by Persian and Turanian teachers, which won some celebrity.

In the Deccan, one of the kings of Gulbargah named Taj al-Din Firuz Shah (d. 825/1422) had 700 damsels who were skilled musicians and dancers. His brother, however, was never absent from the darwish ceremonials, where the religious chant gave him contentment of a different kind. Both Ahmad Shah I (d. 839/1435) and Ahmad Shah II (d. 862/1457) were captivated by their Court minstrelsy, and the wife of the latter, says *Firishtah*, was without equal in her musical accomplishments. The singers and dancers of Muhammad Shah II (d. 887/1482) came from Georgia, Circassia, and Albyssinia. So indulgent was his successor Mahmud Shah II (d. 924/1518) in his passion for music that minstrels were attracted to his Court not only from Delhi and Lahore, but also from distant Persia and Khurasan. Truly, Muslim India was in the forefront in music among her sister nations.¹⁰³

Persia was reawakened culturally under the beneficent Muzaffarids. The renowned Shah Shuja' of Shiraz (d. 786/1384) patronized the minstrel Yusuf Shah and the music theorist al-Jurjani (d. 816/1413). The art was particularly conserved by the Jalairid Sultans of Iraq. Hussain (d. 784/1382) actually neglected his realm through his abiding love for music, whilst the greatest living musicians, Ridwan Shah and 'Abd al-Qadir ibn Ghaibi (d. 840/1435), were the chief Court minstrels of Sultan Ahmad (d. 813/1410).¹⁰⁴ When Timur (d. 807/1405) had accomplished his world-wide conquests, most of the above kingdoms passed into the night, and

Samarqand became the artistic as well as the political centre of the Timurid Empire.

During the reign of Shah Rukh, (d. 850/1447) the Court minstrelsy rose to perfection, and the fetes have been eloquently described by ‘Abd al-Razzaq.¹⁰⁵ Yusuf-i Andakani was his favoured minstrel for he “had no equal ... in the seven climes.”¹⁰⁶ Miran Shah (d. 810/1408), the brother of Shah Rukh, was also infatuated with music as discoursed by al-Khatib al-Mausili and Ardashir-i Changi. Baisunghur (d. 836/1433), the son of Shah Rukh, was devoted to Amir Shahi (d. 857/1453), possessed of three-fold talents as minstrel, poet, and painter. Under the guidance of the vizier Mir ‘Ali Shir (d. 907/1501) the rule of the last of the great Timurid rulers Hussain Mirza Baiqara (d. 911/1506) became the byword of the cultured world of Islam, and the names of his minstrels - Qui-i Muhammad, Shaikhi Nayi and Hussain ‘Udi - became a part of history.¹⁰⁷

In Muslim Spain, in spite of the increasing re-conquests by the Spaniards in the seventh/13th century, the Moors still held that part of the land known as Granada. Here they were hemmed in from all sides, and in 897/1492, they were forced to capitulate. Then followed the most despicable persecutions and ruthless destruction of Arabic literature which had been treasured for centuries. Moorish music and instruments were declared anathema, although that did not prevent the Moors from finding solace from their woes in their music. All that the Spanish priesthood could do was to issue edicts forbidding their congregations to listen to those mouriscas and aravias of the Moors.¹⁰⁸ In the mid-tenth/16th century, they were not only denied their national costume, language, and customs, but forbidden the zumrah and lailah, i.e. the musical gatherings.¹⁰⁹

The whole of the Maghrib - from Morocco to Tunis - had been deeply influenced by the culture of Andalus, and both the Marinid rulers of Morocco and the Hafsid rulers of Tunis had encouraged music at their Courts. Yet more bountiful was the revivification of the art due to the exodus of the Muslim exiles from Spain. The first of these arrived at Tlemcen after the fall of Cordova in 633/1236, followed by another to Tunis at the capture of Seville in 646/1248. Then came refugees to Tetuan after the submission of Granada in 897/1492, which was succeeded by an emigration to Fez from Valencia in 943/1526, and finally the wholesale expulsion of 1018/1609.

These newcomers brought a cultural benefit to the Maghrib, and the Moriscos became the artistic and literary aristocracy of the land. In music, one can actually trace the regional variations in classical Granati or Andalusian art to those immigrants. The Cordovan interpretation belongs to Algiers and Tlemcen, the Sevillian style is that of Tunis, while the Granadan and Valencian modes are to be found in Fez and Tetuan.¹¹⁰

The Ottoman Turks now became a power in the world of Islam to be reckoned with. Having settled originally in Anatolia, they soon extended their power in every direction, and by the year 857/1453 Constantinople and the whole of the Byzantine Empire were in their hands. After defeating the Shah of Persia, they took Kurdistan and Mesopotamia into their hegemony, finally to overrun Syria, Egypt, and Arabia after crushing the Bahri

Mamluks in 922/1517. From that date Turkish music began to assert itself gradually in Arabic-speaking lands and beyond, even as far as Tunis and Algiers where Turkish beys and deys were masters.

From remote times to ozan or bard of the Turkish tribes, with chogur or qopuz in hand - they were lute-like instruments - entertained the people with the turku or folk-song. That had not changed, but a new era had dawned since Constantinople had become - by edict only - the pivot of Islam, and it was no wonder that artists, musicians, poets, and literary men should have sought fame and fortune in the new capital, as well as in the pashaliks of Cairo, Damascus, Mosul and Baghdad. Instrumental music had ever delighted the Turks, and the overture (pishrau) and the decorative "divisions" (taqasim), which had been constituent parts of the old Perso-Arabian naubah, were in great demand.

The poets sang eloquently of the joy of instrumental music in the ninth/15th century, notably Nizami of Quniayh and Ahmad Pasha, and Sultan Murad II (d. 855/1451) enticed the finest minstrels to his Court. Nor should we allow the influence of the maulawiyah or Jalaliyyah dervish communities, founded by Jalal al-Din Rumi (d. 672/1273), to escape our notice, since they hymns (ilahis) had a great spiritual influence. In the next century, the poets Fighani, Fusuli, and Rewani still continued to rhapsodize on music's spell. The instruments praised were mostly of Arabian or Persian origin, although the Turkish qopuz had its share of appreciation.¹¹¹ New instruments came on view.

Quduz Farhadi invented the qaraduzan, a lute of three strings, and a son of Hamdi Chelebi (d. 915/1509) introduced two new pandores called the yonqar and yaltmah.¹¹² During the 11th/17th century music took a prominent part in the general cultural improvement, as we know from a manuscript of Cairo by Mulla Muhammad ibn As'ad, of the time of Sultan Ahmad (d. 1026/1617), which contains the lives of the famous Turkish musicians.¹¹³ Ewliya Chelebi was famed in those days. His teacher was 'Umar Gulshani, who was taught by Ibrahim Gulshani of Cairo (d. 940/1533). The description of the musical life of Constantinople is contained in the "Travels of Ewliya Efendi" (Siyahat Nameh); much of it, based as it is on the Ausaf-i Qustantiniyyah (Praises of Constantinople) composed in the year 1048/1638, gives precise details of musicians and instruments, guilds and makers, in the great emporium of the Near East.¹¹⁴

In that century there arose the poet-minstrels (saz sha'yrleri) who were honoured not only in military but also in religious circles. One direct influence from outside came after the capture of Baghdad in 1048/1638 by Murad IV, who took back with him to Constantinople the Court minstrel of the Persian Shah 'Abbas I, named Shah Quli, whose performances on the shashtar had pleased him.¹¹⁵ The late Ra'uf Yekta thought that the advent of Shah Quli "opened a new era in the history of Turkish music."¹¹⁶

In the Muslim east the 'Adil Shahs of Bijapur, the first of whom was Yusuf 'Adil Shah (d. 916/1511), were revealing themselves as munificent patrons of musicians. Yusuf 'Adil Shah had a skill in music almost equal to that of a professional and even essayed composition. Isma'il (d. 941/1534) rather favoured Turanian and Persian music at his Court. Per contra, Ibrahim

I (d. 965/1557) preferred the arts of the Deccan. Ibrahim II (d. 1035/1626) is claimed to have written a work on music called Nauras with an introduction penned by Zuhuri, the Persian poet (d. 1027/1618).

The Qutbi Kings of Golkunda were no less enthralled by minstrelsy. Sultan Quli (d. 940/1543) brought Persian customs to his Court - which lasted 40 years - and his military naubah sounded at the five hours of prayer. In those days the Gwalior School of Music was the subject of conversation. Its renown was due chiefly to Rajah Man Singh (d. 932/1517), and the most famous of its students was Tan Sin, who had been taught by Muhammad Ghauth. Another of the same circle was Bakhshu, whose dhurpads became the repertory of the best minstrels. When Babur (d. 936/1530) became the first of the Mughul Emperors of Hindustan (India), most of the preceding dynasties were absorbed. He had been reared in Courts where music prevailed.¹¹⁷

From the statements in the Babur Nameh it would seem that the Emperor was even a composer, and it is believed that his compositions once existed.¹¹⁸ His son Humayun (d. 963/1556) also encouraged music, and sincerely believed that the Sufi dance was the complete expression of the hikmat-i ilahi. At Court, musicians had their special days for audition, and some of them - 'Abd Allah Qanuni, Muhammad Surna'i, and the vocalists of Hafiz Dost Muhammad Khwafi and Ustad Yusuf Maudud - are registered in the Akbar Nameh. The Court of the renowned Akbar (d. 1014/1605), as described in the A'in-i Akbari of Abu al-Fadl, shows how important music was both to the policy and the taste of the Emperor.

The musicians were formed into seven groups, 36 of whom are named in Abu al-Fadl's work. He was catholic in his choice for not only were minstrels selected from famed Kashmir and Gwalior, but the best of them came from Herat and Khurasan, and they were singers, chanters, and instrumentalists. More than half of these had Muslim names. The Emperor is said to have himself composed 200 items of music. Among the art treasures of his day there is one depicting the arrival of Tan Sin at his Court. Abu al-Fadl tells us of the widely spread net that was cast to capture the best of vocal music - the dhurpad of Gwalior, the chind of the Deccan, the qual and taranah of Delhi, the kajri or zikri of Gujrat, the bangula of Bengal, and the chutkalah of Jaunpur.

Jahangir (d. 1037/1627) followed his father in his love of music, has favoured minstrel being Shauqi, who sang Hindi and Persian songs in way that "cleared the rust from human hearts." There is a portrait of him in Fox Strangway's Music of Hindustan.¹¹⁹ Many other musicians of Jahangir's Court are mentioned in the Tuzuk-i Jahangiri and the Iqbal Nameh. In the first named work is described the military band of this Emperor. Shah Jahan (d. 1068/1658) made the Court music one of the glories of his reign. It was he who collected the dhurpads of the Gwalior composer Bakhshu, which numbered one thousand items. On the wedding of his son, Aurangzib (d. 1119/1707), he expended a small fortune on music alone.

Alas, when Aurangzib ascended the throne he dispensed with his Court minstrelsy, to the dismay of the people at large. Fortunately, Bahadur Shah (d. 1124/1713) reinstated the musicians and raised them to mansab ranks.

By this time, owing to internecine strife, the great Mughul Empire began its political and cultural decline.

Of the state of music in Persia during the 11th/17th century, we know but little save what the pictorial art reveals, although at the brilliant Court of ‘Abbas I (d. 1038/1629) the older instrumental art still held its own.¹²⁰ Four European travellers - Raphael du Mans, Chardin, Pouillet, and later Kaempfer - supply many important details. A picture of the Court minstrels of Safi I (d. 1052/1642) - actually portraits - has been preserved.¹²¹ Persia seems to have been less troubled by the objections of the legists to al-sama‘ than was the case elsewhere. Perhaps they still remembered Hafiz who once said, “When the harp is sounding who cares about the objector?”

Yet there were some Persians, for example, Muhammad ibn Jalal Ridwi (d. 1028/1619) and ‘Abd al-Jalil ibn ‘Abd al-Rahman (d. 1061/1651), who replied at length to the legists.¹²² Incidentally, Chardin shows that the Indian vina was used in Persia as the kingira,¹²³ and even Mersanne (1046/1636) delineated it in Europe.¹²⁴ Strangely enough, it is mentioned by the Arabic writer al-Jahiz (d. 255/869), who writes it - probably a scribal error - as kinkila, and it is also specified by al-Jurjani (d. 816/1413).¹²⁵ By the 12th/18th century, when Nadir Shah (d. 1160/1747) brought a brief resurgence to Persia’s greatness, many had disappeared, although the dulcimer (santir) found a place.

Iraq and Mesopotamia, now in the hand of the Turks, favoured only the Turanian art. Baghdad was the centre of this imported culture, and it spread to Hillah and Basrah. To the north, Kurdish tastes prevailed. The most artistic centres were those where the Mamluk pashas had control, and where Georgians and other Caucasians were given preferment, which meant that quite a new Oriental type of music gained ground.¹²⁶ Karsten Niebuhr, after visiting Baghdad in that century, gave a fair description of its music. He noted the use of what he called a base continue by accompanying instruments, although he seems to have meant a point d’orgue or pedal point.¹²⁷ He mentions and delineates three types of pandore, and the rectangular and spiked viols.

Syria was little better off, as we know from the books of Alexander and Patrick Russell written the 12th/18th century.¹²⁸ They aver that the Allepans were “fond of music,” and in their performances the instruments generally were well in tune, and...kept excellent time.

Notes

Chapter 58: Music (continued)

C. The Music Theorists

“There is one and the same principle which, if prevailing in the at tempered particles of the elements, is equipoise of temperament, if produced in tones in pure and delightfully interval, if apparent in gesture is grace, if observable in languages in rhetoric and eloquence, if created in the limbs is beauty, if the mental faculties is equity.”

Jalal al-Din Dawwani: Akhlaq-i Jalali.

In addition to those who conceived music to be “like a fan” on a sultry day were those to whom it was “like medicine,” as we have heard in the opening fanfare to this chapter. That was precisely how the Pythagoreans viewed music, and it was from them that the notions of the “theory of numbers,” the “harmony of the spheres,” and the “doctrines of the ethos (tathir)” were handed down to Muslim peoples as methodical systems, although the history of the Semitic and Aryan races in pre-Islamic days teems with those beliefs. In fact, the Greeks derived their theses on those matters from the ancient Semites of Babylonia-Assyria, as shown elsewhere.¹

Iamblichus affirms that Pythagoras learned those secrets from the Chaldaei of Babylon,² and books on music and arithmetic by Pythagoras were known in Arabic,³ as were the works of his disciples Iamblichus, Porphyry, Proclus and Nicomeachus.⁴ Perhaps the first impact came through the pseudo-Aristotelian production known as the “Book of Government” (Kitab al-Siyasah), said to have been translated into Arabic, via Syriac, by Yuhanna ibn Batriq (d. c. 200/815),⁵ and this is what we read therein on the influence of music and the harmony of the spheres. Mental diseases are amenable to cure by means of musical instruments which convey to the soul the harmonious sounds which are (ultimately) due to the motions of the spheres in their natural movements.

When those harmonious sounds are interpreted through human agencies, they produce music which is enjoyed by the human soul, because the harmony of the spheres is mirrored in the harmony of man’s nature, which is fundamental to life. That work was translated from Arabic into Latin as the *Secretum Secretorum* about the year 530/1135, and won considerable popularity during the European Middle Ages.⁶

Following Pythagoras, the cosmic order of things was explained under the proposition that “everything is number,” and since mundane music was among the ectypes of numerical proportion, the harmonious order of things covered both melody and rhythm, the various genres of which could banish depression, assuage grief, halt passion and cure sickness. The theory of numbers fascinated Muslim peoples because, unlike geometry, which depended on visual appreciation, it was purely mental sciences. The Pythagorean scale in music, which was based on the “theory of numbers,” was known quite early to the Persians and the Arabs, and the Khurasanians even improved on it.

Islam, having no racial boundaries, the special musical characteristics of the Persian, Arab, Syrian, and Turkoman found open acceptance in the capitals and cities of the Caliphate. Because of these national peculiarities it

soon became evident that some sort of fixation of method and system was urgent, and this expediency was brought to fruition by an Arab named ibn Misjah (d. c. 97/715) who, having travelled in Syria and Persia and taken lessons from practitioners and theorists, conceived a system of music theory and a method of practice which were adaptable to existing conditions in Arabic-speaking lands. These, we are told, were adopted generally.⁷

Thus were the eight Arabian melodic modes (asabi') classified in two groups of four each: the first in the course (majra) of the binsir, i.e. using the major third (408 cents), and the second in the course of wusta, i.e. using the minor third (294 cents).⁸ At the same time eight rhythmic modes (iqa'at) were formulated, also in two groups of four each, those numbers being in accordance with cosmic theories. All the song books of the period, from Yunus al-Katib (d. c. 148/765) to al-Isfahani (d. 356/967), specify the melodic and rhythmic modes of each song.⁹ Meanwhile, a neutral third (355 cents), i.e. an interval half-way between the major and minor third. It was introduced by a certain lutanist named Zalzal (d. 175/791),¹⁰ although a somewhat similar three-quarter tone had existed in the pre-Islamic measured pandore (tanbur mizani).¹¹

Another wayward interval was the Persian minor third (303 cents) which was sharper than the Pythagorean interval (298 cents),¹² and it was these alien intervals which both al-Isfahani and ibn 'Abdi Rabbihi blames for the decadence of the pure Arabian music in the third/ninth century. There are many earlier theorists of music, notably Yunus al-Kativ (d. c. 148/765) who wrote a "Book of Melody" (Kitab al-Naghm). That was also the title of the book by al-Khalil (d. 175/791), who also compiled a "Book on Rhythm" (Kitab al-Iqa'). He was the "father of prosody".¹³ A more important treatise appears to have been the "Book of Melody and Rhythm" by Ishaq al-Mausili (d. 236/850), and that was accomplished, says al-Isfahani, without the author's knowing an iota of the work of Euklid.¹⁴ None of these works has come down to us, but we know precisely what al-Mausili's theoretical principles were from the Risalah of his disciple ibn al-Munajjim (d. 300/912).

In the mid-third/ninth century a new world dawned for those interested in that group of the sciences known as the quadrivium, i.e. the 'ulum riyadiyyah, which included the theory of music. At "House of Learning" (Bait al-Kikmar) in Baghdad were scholars who had translated the great Greek writers on Music into Arabic, including Aristotle, Aristoxenus, Nicomachus, Euclid, Ptolmy, and probably Aristides Quintillanus.¹⁵ The first to avail himself of the new learning was al-Kindi (d. c. 260/873), and three or four - out of a dozen - of his works on the subject have been preserved. The entire gamut of the science of music is covered by him in his several extant works, two of which have been translated or extracted.¹⁶ He not only appreciated music as a science for mathematicians and joy to auditors, but as a prescription for physicians to administer to the afflicted mind and body.

As de Boer says, al-Kindi applied mathematics to medicine in his theory of compound remedies, like the effect of music on geometrical proportions.¹⁷ Everything within the entire macrocosm was linked together.

Each note on a lute was connected with melodic mode (tariqah), rhythm, and sentiment. These, in turn, were conjoined with the planets, seasons, elements, humours, colours, and perfumes. In his minute description of the lute - the earliest which we possess - "the four gold things" dominated all else. There are four strings, tuned in fourths, and four frets. The strings from the lowest to the highest were four-ply, three-ply, two-ply and one-ply.¹⁸

His disciples, the Ikhwan al-Safa (fourth/tenth century), followed him in most things, but made the strings compounded of 64, 48, 36, and 27 strands respectively.¹⁹ They assigned to every melodic and rhythmic mode a specific influence (tathir), a doctrine which held sway in Islamic lands up to the 14th/20th century. His most illustrious student was al-Sarakhsi (d. 288/899), but these five books on music have not survived.²⁰ Thabit ibn Qurrah (d. 288/901) is credited with eight treatises on music, yet not a page has come down to us.²¹ Other theorists were Mansur ibn Talhah (d. c. 299/910), a follower of al-Kindi, ibn Tahir al-Khuza'i (d. 300/913), one of the most learned in the philosophy of music,²² ibn al-Munajjim (d. 300/912) whose "Treatise on Music" (Risalah fi al-Musiqi) still exists,²³ Qusta ibn Luqa (d. c. 300/912),²⁴ and Abu Bakr al-Razi (d. 313/925) who penned a "Book of Summings-up of Music" (Kitab fi Jumal al-Musiqi).²⁵ The fame of all these was swept aside on the emergence of the "Second Master" (i.e. second only to Aristotle) whose name became known in Europe as Alfarabius.

Al-Farabi (Alfarabius) was a Turkoman, although educated in Iraq. Celebrated chiefly as a philosopher, he also takes front rank as a music theorist, being known especially for his "Major Book on Music" (Kitab al-Musiqi al-Kabir) which was the greatest contribution to the subject up to his time. He tells us that almost all the Greek works on music had been translated into Arabic. Most of these he studied, although he mentions no one by name, save Themistius. Unlike the latter, who was not a practitioner in music, al-Farabi was an instrumental performer,²⁶ and whilst most of his theoretical discussion was based on Greek authors, on the practical side he supplied original material not to be found elsewhere, especially in his description of the existing instruments of music among the Arabs.

Being a good mathematician and physicist, he was fully equipped to deal with speculative theory ('ilm al-nazari). Although he indebted to the Greeks, he avoided their errors in that he did not agree that sound is heard in water in less degree than in air, nor that wool when struck produces no sound, as Aristotle tells us.²⁷ Neither did al-Farabi repeat the blunder of Nicomachus that Pythagoras discovered the consonances by comparing the weight of the hammers in the blacksmith's shop,²⁸ a legend repeated by Gaudentius of Boethius.²⁹ His treatment of the influence (tathir) of music leaves the Greeks and al-Kindi far behind, as one would readily expect from a naturalistic philosopher.

Further east was Muhammad ibn Ahmad al-Khwarizmi (d. c. 370/980) who was in the service of the vizier of the Samanid Prince, Nuh II. He compiled an encyclopedic "Keys to the Sciences" (Mafatih al-'ulum), one key of which unlocked the door of music.³⁰ Another scientist, Abu al-Wafa' (d. 388/998), penned a "Compendium on the Science of Rhythm"

(Mukhhhtasar fi Fann al-Iqa'),³¹ while in distant Muslim Spain a "Treatise on the Composition of Melodies" (Risalah fi tallif al-Alhan) was produced by 'Ali ibn Sa'id al-Andalusi (fourth/tenth century).³² The contemporary Ikhwan al-Safa has been signalized already, especially in their spiritual approach to music. Yet they were well versed in the science of acoustics. One recalls how the famous German physicist Helmholtz argued that musical tones are distinguished by their force, pitch, and quality, and that the force of a musical tone increases and diminishes with the amplitude of the oscillations of the particles of the sounding body.³³

Preece and Stroh questioned the definition saying that loudness does not result from amplitude of vibration only, but that it also depends upon the quantity of air in vibration.³⁴ The Ikhwan al-Safa had proclaimed that view over 800 years earlier when they said, "Hollow bodies, like vessels...will resound for a long time after they are struck, because the air within them reverberates time after time until it becomes still. Consequently, the wider the vessels are, the greater the sound, because more air is put into vibration.

Those encyclopedic philosophers are also recognized the spherical propagation of sound,³⁵ whilst the Aristotelian De Audibilibus (802a) had stated that "the direction of sound follows a straight line."³⁶ Meanwhile, the tractates of the Ikhwan al-Safa were being introduced into Muslim Spain by Maslamah al-Majriti (d. 398/1007), and so widespread was their circulation that the name of al-Majriti was attached to them in that land.³⁷

From Turkestan there came the world-renowned ibn Sina (d. 428/1037), better known in Europe as Avicenna, and it was in his widely read book entitled "The Cure (al-Shifa') that a chapter (fann) was devoted to music. Like al-Farabi, he passed over the Pythagorean dreams of the "harmony of the spheres," being content to deal with the art per se which, as he knew from personal experience, was often a cure from mortal woes. His treatment of the theory of music is different from that of al-Farabi because what was practiced in Bukhara, Hamadan, and Isfahan was alien to that in Syrian. The fretting of the lute was certainly dissimilar, the first semi-tonal fret (mujannab) being the diatonic interval (112 cents), whereas elsewhere the semi-tone was the limma (90 cents), whilst the Zalzalian neutral third was slightly flatter (343 cents).³⁸

He gives the notation of a few of the melodic modes, and from that one sees the Persians were retaining their fanciful names of them, such as Salmaki, Nawa, etc. These Persians terms crept into Arabian music in the third/ninth century, at first their scales agreed with those of the old Arab "Finger modes" (asabi'), but later indiscriminately. All the old Arabian instruments are mentioned together with a few strangers, viz. the 'anqa', evidently a long-necked instrument, the salbaq, probably the Greek symbyke (the Aramaic sabbeka), and the sanj jinni or sini, seemingly the Chinese metalophone.³⁹ Ibn Sina also introduced a chapter on music in a shorter work entitled "The Deliver" (al-Najat) which was translated into Persian - as the Danish Nameh-i 'Ala'i - by his student Abu 'Ubaid al-Juzajani.⁴⁰

Another of his disciples was Abu Mansur ibn Zailah (d. 440/1048), whose "Book of Sufficiency of Music" (Kitab al-Kafi fi al-Musiqi) is even

more valuable than the above treatises of ibn Sina. Although Baron d'Erlanger thought otherwise, it contains much material not to be found elsewhere, especially on the practical art of music, and also passages from a treatise by al-Kindi which has not been known hitherto.⁴¹

Strange to say, al-Kindi had written a work entitled "The Book on the Division of Canon" (Risalah fi Qismat al-Qanun), which might have been a commentary on Euclid's Sectio Canonis since we know that he was acquainted with the book.⁴² Yet it was not until the emergence of a scientist of the eminence of ibn al-Haitham (d. 430/1039) that we do find a "Commentary on the Canon of Euclid" (Sharh Qanun Uqlaid), together with "Discourse on the Commentary on the Harmonics" (Maqalah fi Sharh al-[A]rmuniqi), the latter being probably the Introctio Harmonica of Cleonides.⁴³ A far more remarkable book was ibn al-Haitham's "Treatise on the Influence of Melodies on the Souls of Animals" (Risalah fi Tathirat al-Lahun al-Musiqiyah fi al-Nafus al-Hayawaniyyah).⁴⁴

Unfortunately, we do not know its scope of inquiry because the ruthless hand of time seems to have erased it. Yet it dealt with a set of phenomena which had long enticed the minds of Muslim peoples - the phenomena that the camel's pace could be hastened or retarded by music's power, that horses could be persuaded to drink by its urge, which reptiles could be charmed and stilled, and that birds could be lured by its potency.⁴⁵ Nor should we forget the Andalusian lexicographer ibn Sidah (d. 458/1066) whose Kitab al-Mukhassas contains several sections on music and musical instruments.⁴⁶ There are other famous men of Muslim Spain who "hit the mark" - as the Arabs say - in the science of music, although some of them, owing to the intolerance of the Berber legists, sought other lands where their gifts were appreciated.

One of these was Abu al-Salt Umayyah al-Andalusi (d. 529/1134) who went to Egypt. He not only excelled as a music theorist but as a practical musician as well.⁴⁷ His "Treatise on Music" (Risalah fi al-Musiqi)⁴⁸ must have been an important work since it was translated into Hebrew,⁴⁹ and quoted by Profist Duran.⁵⁰ An outline of its contents has been given in English.⁵¹ His compositions appear to have had some influence in North Africa.⁵² The learned philosopher ibn Bajjah (d. 533/1138) compiled a "Book of Music" (Kitab al-Musiqi)⁵³ which, says ibn Sa'id al-Maghribi, was famed in Western Islamic lands as was al-Farabi's book on Eastern Islamic lands.⁵⁴ He also contributed a "Book of the Soul" (Kitab al-Nafs), doubtless a commentary on Aristotle's De Anima, which deals with the sense of hearing (al-sam') and the physical bases of sound (sout).⁵⁵

Another Andalusian savant was ibn al-Haddad (d. 562/1165). He wrote a work, entitled by Casiri as Musices Discipline, without giving the Arabic equivalent.⁵⁶ Better known was ibn Rashd (d. 593/1198) famed in European books as a philosopher and commentator. In his "Commentary on Aristotle's De Anima" (Sharh fi al-Nafs li Aristatalis)⁵⁷ he naturally treats of the spherical propagation of sound, which was not touched upon by the European writers until Michael Scot translated into Latin which version was printed in 877/1472.

In the Near and Middle East, the names of theorists of music crop up in the pages of cultural history. Abu al-Hakam al-Bahili (d. 550/1155) was highly esteemed as a mathematician and scientist at Baghdad and Damascus. His work on music was “well known.”⁵⁸ More renowned was Ibn al-Naqqash al-Baghdadi (d. 574/1178).⁵⁹ In ‘ilm al-musiqi he was the tutor of Yahya al-Bayasi who was in the service of the Ayyubid Sultan Salah al-Din (d. 591/1193).⁶⁰ Muhammad ibn Abi al-Hakam (d. 576/1180), a son of Bahili, too “had knowledge of the science of music,” in addition to being a good practitioner in it.⁶¹ At the Nizamiyyah College at Baghdad was Kamal al-Din ibn Man‘ah (d. 551/1156); he was “without a rival” in astronomy, conics, music, and mensuration.⁶²

Then there was ‘Alam al-Din Qaisar (d. 649/1251), the “great master of the age in all the mathematical sciences,” a student of Kamal al-Din. Hassan ibn ‘Umar says that ‘Alam al-Din was particularly distinguished for his profound knowledge of music.⁶³ Further East there arose Fakhr al-Din Razi (d. 606/1209), whose “Assembling of the Sciences” (Jami‘al-‘Ulum), an extremely useful encyclopedia, contains chapters in nine sections on the theory of Music. In some respects, he was quite an original thinker.⁶⁴ There is also a small tract on music by Nasir al-Din al-Tusi (d. 672/1274) preserved at Paris, which, however, contains only the elements of the theory of music.⁶⁵

A really important work is one by al-Hassan ibn Ahmad ibn ‘Ali al-Katib (fl. 626/1228) entitled “The Perfection of Knowledge of Music” (Kamal al-Adab al-Ghina’), the solitary manuscript copy of which is to be found in Constantinople. It contains ⁴⁰ sections (abwab) and covers the entire field of music.⁶⁶ Finally, came the famous Safi al-Din ‘Abd al-Mu‘min al-Urmawa al-Baghdadi (d. 693/1294). He was the author of “The Book of Musical Modes” (Kitab al-Adwar) and “The Sharafian Treatise on Musical Proportion” (Risalah al-Sharafiyah fi al-Nasab al-Talifiyyah), which revolutionized the science of music in the Near and Middle East.⁶⁷ He took the scale of the old Khurasanian pandore (tanbur Khurasani) and used its intervallic progression of limman, limman, comma, i.e., 90, 90, 180 cents, as the basis for what came to be called the “Systematist” theory.

The German savant Kiesewetter called him the “Zarlino of the Orient,”⁶⁸ whilst the English musicologist Sir Hubert Parry considered the new scale to be “the most perfect ever devised.”⁶⁹ Riemann, the music historian,⁷⁰ shows that it gives consonances purer than those of the European tempered scale, whilst Helmholtz, the physicist, considered that the theories were “noteworthy in the history of the development of music.”⁷¹ It spread far and wide, and was accepted by Qutb al-Din al-Shirazi (d. 710/1310), the author of the Persian encyclopedia known as “The Jewel of the Crown” (Durrat al-Taj),⁷² and Mahmud al-Amuli of the same century, who compiled “The Precious Things of the Sciences” (Nafa’is al-Funun), also in Persian.⁷³

The theories of Safi al-Din ‘Abd al-Mu‘min are to be seen in the “Treasure-House of Rarities” (Kanz al-Tuhaf) written in the mid-eighth/14th century, although we read in the section on musical instruments in that book that some performers were using older system, i.e., the earlier Person-Arabian

Phythogrean scale of al-Farabi's days.⁷⁴ The books just mentioned were all in Persian, since the Persian renaissance had spread far beyond its frontiers.

Still, Arabic literature held its own in Spain, Egypt, and Iraq, and in the domain of music theory we have many exponents: ibn al-'Ala'i al-Baghdadi (eighth/14th century) in his "Reading of Time in the Art of Melodies" (Qir'at al-Zaman fi'Ilm al-Alhan),⁷⁵ al-Khatib al-Irbili (fl. 731/1329) in "The Jewels of Arrangement in the Knowledge of the Notes: (Jawahir al-Nizam fi Ma'rifat al-Angham),⁷⁶ Muhammad ibn 'Isa ibn Kara (d. 759/1358) in "The Goal of Inquiry in the Science of Melodies and Rhythm" (Ghayat al-Matlun fi Fann al-Angham w-al-Durub),⁷⁷ 'Amr ibn Khidr al-Kurdi (d. 800/1397) in "The Treasury of the Desideratum in the Melodies and Rhythms" (Kanz al-Matlub fe 'Ilm al-Dawa'ir w-al-Durub);⁷⁸ but more important still was ibn al-Tahhan (eighth/14th century), whose "Collector of the Sciences" (Hawa al-Funun) is of extreme value, especially on the construction of instruments of music.⁷⁹

The Persian renaissance had greatly influenced Turkey. This evocation was due chiefly to 'Abd al-Qadir ibn Ghaibi (d. 840/1435), a tremendous personality who had been the chief minstrel at many Courts from Baghdad to Samarqand, and was better known as the author of the "Collector of Melodies" (Jami' al-Alhan) and other works which, with those of Safi al-Din 'Abd al-Mu'min, became the accepted textbooks. The former were somewhat critical of a few axioms of the latter.⁸⁰ Indeed other authors, writing in Arabic, were just as contentious, including the author - probably al-Jurjani (d. 816/1413)⁸¹ - of the "Maulana Mubarak Shah Commentary" and the "Muhammad ibn Murad Treatise" in the British Museum.⁸²

All this reflects the keen critical attitude of these Muslim theorists on music. Although the Persian renaissance had greatly influenced Turkey, which was by this time beginning its political domination of the Near East, Arabic culture still held literary sway in Syria, Egypt, and Iraq. A Turkish writer, Khidr ibn 'Abd Allah, had written a treatise on the "Musical Modes" (Adwar-i Musiqi) for Sultan Murad II, in which he mentions al-Farabi, 'Abd al-Mu'min, Ptolemy, Nicomachus and a certain 'Abd al-'Aziz al-Kirmanji as his authorities,⁸³ while another Turkish author, Ahmad Oghlu Shakhr Allah compiled a book based on the Persian "Treasure House of Rarities" (Kanz al-tuhaf) written in the previous century.⁸⁴

Al-Ladhiqi (d. 900/1494) dedicated his Arabic "Treatise of the Conquest of Music" (Risalat al-Fatihyyah fi al-Musiqi) to the Turkish Sultan Rayazid II.⁸⁵ Meanwhile, ibn Khaldun (d. 808/1406) had written in the famous "Introduction" (Muqaddimah) to his universal history the "Book of Examples" (Kitab al-'Ibar)⁸⁶ with its chapter on music. More important, to the theory and practice of music, was a treatise by al-Maridini (d. 809/1406) called the "Introduction to the Theory and Canons of Melodies" (Muqaddiman fi 'Ilm Qawanin al-Agham). The same writer published a "Commentary in Rajaz verse on the Melodic Modes" (Urjuzah fi Sharah al-Naghamat).⁸⁷

In fact, verse had become a popular, although not a perspicuous - medium for that subject. More satisfying was an anonymous treatise entitled "The Advantage in the Arrangement of the Melodies upon the Times and

the Zodiac” (Fi’ideah fi Tartib al-Angham ‘ala al-Ayyam w-al-Buruj), which reveals that the old conceit in the influence (tathir) of the heavenly spheres was still as strong as ever.⁸⁸ This is also most apparent from the “Treatise Concerning the Knowledge of Melodies” (Risalah fi ‘Ilm al-Angham) by Shihab al-Din al-‘Anjami (ninth/15th century).⁸⁹ On the purely instrumental side is a “Survey of the Concerns and Anxieties in the Explanation of the Instruments of Music” (Kashf al-Humum w-al-Kurub fi Sharh Alat al-Tarab), a most important treatise on music and instruments in the ninth/15th century Egypt, quoting many unknown authorities - Taqi al-Din Muhammad ibn Hassan al-Farabi (or Faryabi), Ahmad ibn Muhammad ibn Ayyub al-Khwarizmi, and others.

The only MS available of this book is in Constantinople.⁹⁰ The names quoted reveal men of Turkoman origin. Two others of that stirps who were music theorists were Sa’d al-Din Kammari (ninth/15th century) who wrote a book on the harp (chang) in the form of a dialogue between master and student, and a Fakhr al-Din al-Khujandi (tenth/16th century) who penned a clever criticism (hashiyah) of Safi al-Din ‘Abd al-Mu’min.

With the dawn of the tenth/16th century came the domination of the Ottoman Turks from Kurdistan to Algeria, and within those boundaries the theory and science of music fell into desuetude. The compendiums of the sciences, which almost always include music, were current - the older Irshad al-Qasid of al-Akfani (d. 749/1348), the Maqalid al-‘Ulum of Jurjani (d. 816/1413), the Unmuzaj al-‘Ulum of al-Fanari (d. 839/1435), and the later Miftah al-Sa’adah of Tashkoprizade (d. 968/1560) dealt with the subject, but in his last work most of it was borrowed from older compendiums.⁹¹

A certain Shams al-Din al-Saidawi al-Dimashqi wrote a treatise called “The Book Concerning the Acquisition of the Melodies” (Kitab fi ma’rifat al-Angham). Like several other such treatises of the period, it was in verse, but it revealed a neoteric device for notation by means of a stave of eight or so lines.⁹² Another tract in rajaz verse was by Nasir al-Din al-‘Ajami.⁹³ Two others in rhymed prose have come down to us.⁹⁴ A really solid work of that century was “The Treatise of the Discoverer in the Science of the Melodies” (Risalt al-Kashif fi ‘Ilm al-Angham) by Muzaffar ibn al-Hussain ibn al-Muzaffar al Haskafi,⁹⁵ while in Morocco, ibn al-Wansharisi (d. 956/1549) contributed a valuable work on “The Natures, Elements and Modes” (Taba’i’, Tubu’, wa Usul).⁹⁶

In the 11th/17th century there lived a certain bu ‘Isami (d. c. 1103/1690) who was the teacher of another music theorist Muhammad ibn Tayyib al-‘Alami (d. 1136/1722), the author of “The Companion of the Performer” (al-Anis al Mutrib), also of Moroccan origin.⁹⁷ Then there was a “Book of the Combinations in the Science of Music and the (Kitab al-Jumu’ fi ‘Ilm al-Musiqi w-al-Tubu’) by ‘Abd al-Rahman al-Fasi (d. 1098/1685).⁹⁸ It must be remembered that Morocco, like Muslim Spain, ignored the scale of the Systematists,” and followed the old Arabian musical system based on the Pythagorean scale with the occasional intrusion of Zalzalian neutral third (355 cents).

In Persian the scale of the “Systematists” was used in the 11th/7th century, the chief authority being Abu al-Wafa’ ibn Sa’id.⁹⁹ Here, treatises

on music abounded, although some of them were trivial in comparison with those of the glorious past. One is named “The Teaching of the Modes” (Ta’lim al-Naghamat), another is the Treatise on the Science of Music” (Risalah ‘Uklum Musiqi),¹⁰⁰ and lastly “The Exquisite Pearl in the Art of Music” (Durr al-naqi fi Fann al-Musiqi). The last was by Ahmad al-Muslim al-Mausili (fl. 1150/1737), but it was in Arabic, having been derived from the Persian work of ‘Abd al-Mu’min al-Balkhi.¹⁰¹

In Muslim India where Persian, Khurasanian, and Turkomanian musicians were favoured side by side with those of India, it is obvious that the former musicians, trained in an art that was in many respects different from that of the Aryan peoples of India, took direction from such books on the theory of music as were known in Persian, just as the Indian musicians turned to Sanskrit sources of information. We know of two Persian books on music theory that were dedicated to the Emperor Akbar (d. 1014/1605). They were the “Excellent of the Modes” (Tahfat al-Adwar) by ‘Inayat Allah ibn Mir Hajj al-Harawi, and the “Treatise on the Science of Music” (Risalah dar ‘Ilm al-Musiqi) by Qasim ibn Dost ‘Ali al-Bakhari.¹⁰²

An Amir of the Court of Aurangzib named Shah Qubad ibn ‘Abd al-Jalil al-Harithi, called Diyanat Khan, caused a collection to be made of Arabic and Persian treatises on music of such authors as al-Kindi, ibn al-Munajjim, al-Farabi, ibn Sina, ibn Zailah, Safi al-Din ‘Abd al-Mu’min, and also of many later writers,¹⁰³ whose works he himself had collated. Two Persians writers appear to have made translations of or adaptations from Sanskrit treatises. One was entitled Rag Darpan issued by a certain Faqir Allah in about the year 1073/1662. Another was Kitab Parjat Sangit written by Mirza Rauzan Zamir (d. c. 1080/1669), praised by Shir Khan Lodhi. A third book was “The Excellent Thing of Hindustan” (Tuhfat al-Hind) by Mirza Khan Muhammad ibn Fakhr al-Din and was dated 1086/1675. ‘Iwad Muhammad Kamil wrote about playing the bin in his Risalah dar ‘Amal Bin wa Thath-i Raghā’i, while Abu al-Hassan Qaisar contributed a book called “The Knowledge of the Melodies” (Ma‘rifat al-Nagham).¹⁰⁴

D. Influence

“Thy neighbour is thy teacher.”

An Arabic Proverb

As mentioned elsewhere,¹⁰⁵ the ancient Near and Middle East had been influencing Greece and Rome from time immemorial. With the dawn of Islam, this stimulation from the Orient increased by leaps and bounds, as the Muslims were on European soil from the second/eighth century in the Iberian Peninsula, and from the ninth/15th century in the Balkans. Culturally, the former impact was a widespread blessing, not only to Spain and Portugal but also to the rest of Europe. The Arabs and Moors comprised some one-tenth of the population of the Iberian Peninsula, and its leisured classes were facile princeps in all the concerned art, literature, and science.

It is not all surprising that this newly imposed civilization from the East should have captivated all eyes, ears, and minds. What we owe to Arabic authors in literature, science, and philosophy, and to Islamic artisans in architecture and the minor arts have been detailed at some length elsewhere

in the present work.¹⁰⁶ Europe's indebtedness in music in Muslim Spain and Portugal has been the favourite theme of the present writer for many years.¹⁰⁷ Of its more general diffusion, a further endeavour should be made to indicate the *primum mobile* which induced other lands to take this exotic art to their hearts.

To the peoples of Islam, music was not merely a diversion of the privileged classes, but the heritage of all, and was, therefore, part and parcel of the social life of the whole community, as the *Ikhwan al-Safa* had thought.¹⁰⁸ That was what the peoples of the Iberian Peninsula found to be the case with the Moors. Of the music of this land before the Muslim invasion in 91 - 93/710 - 712 we know very little. It is true that we read of Isidore of Seville (d. 15/636) whose influence on medieval culture has been lauded to the skies,¹⁰⁹ but what Isidore tells us about music in his *Originum sive Etymologiarum* does not enlighten us on the contemporary music, since almost everything that he has collected under the heading is derived from alien and earlier sources, as Migne has shown.¹¹⁰

In the "Codex Toletanus" (second/eighth century) of Isidore's *Etymologiae*, we have marginalia in Arabic. One may ask why? The answer is that the educated classes in Christian Spain found that the acquisition of that language opened up a new world to them in the arts, sciences, and literature, and the year 188/804, Arabic was in official use in charters and canonical decrees.¹¹¹ The Bishop Alvarus of Cordova (third/ninth century) was lamenting the spread of Arabic culture and learning to the detriment of the Christian Scriptures, shows which way the wind was blowing.¹¹² It is in iconography, perhaps, that the earliest Moorish influence in music may be espied as, for example, in the *S. Medard Evangeliarum* (second/eighth century), the *Psalterium Aureum* (third/ninth century),¹¹³ and in the miniatures (fourth/tenth century) reproduced by M. Serrano Fatigati,¹¹⁴ all of which show long-necked pandores and other instruments, including large and small rebecks.¹¹⁵

Some of these necked instruments, such as the lute and pandore, had frets (*dasatin*) on the finger board, which fixed the Arabo-Pythagorean scale with absolute precision. Prior to that, European musicians had to depend on their ears alone while tuning strings and "stopping" notes. Here is a list of Spanish instruments with their Moorish originals named in parentheses: *atambor* (*al-tanbur*), *laud* (*al-'ud*), *rabe* (*rabab*), *canon* (*qanun*), *axabeba* (*al-shababah*), *albogon* (*al-buq*), *annafil* (*al-nafir*), *sonajas de azofar* (*sunuj al-sufr*), and *atambal* (*al-tabl*). All of these instruments may be seen in the miniatures of the *Cantigas de Santa Maria* of Alfonso el Sabio (d. 683/1284),¹¹⁶ whilst the *Libro de Buen Amor* of Juan Ruiz (d. c. 751/1350) makes distinction between Spanish and Moorish instruments such as in the *gitarra morisca* and the *guitarra latina*.¹¹⁷ One is, therefore, not surprised to find Rafael Mitjana, the historian of Spanish music, lauding "this Oriental civilization, so rich and so exuberant...imprinting an indelible mark on so many examples of Spanish art, and more especially upon music."¹¹⁸

The Spanish population, seeing how universal and attractive Moorish music and song were among its people, soon became as ardent auditors and practitioners as the Muslims themselves, and gathered to the "leila" (Ar:

lailah) and “zambra” (Ar. zumrah) of the latter to hear their “cana” ghaniyyah), “huda” (Ar. huda), and “anaxir” (Ar. nashid), since Moorish “aravia” fascinated their ears, and the “mourisca” tempted their feet. So ravished by enthusiasm were the Spaniards with such displays that they were led in excitement to cry “algzara” or “alarido” in admiration. These words are the Arabic al-ghazara (copious) and al-‘arid (amplitude).

One may still hear cries of “Ole, Ole” (Allah, Allah), punctuating the performance of a “cante hondo” in modern Spain, when the audience is carried away by the clever ornamentation (Ar. tahsin) or the melody by a singer or a player.¹¹⁹ As Professor J. B. Trend says, “this tendency to profuse ornamentation is seen in every form of art, whether cultivated or popular, and it...undoubtedly goes back to the time of the Moors.”¹²⁰ Among the dances the “mourisca” was much fancied by the Spaniards and the Portuguese, and in the sports and pastimes of the latter the Moorish influence is quite patent.¹²¹ Joy as well as thanksgiving was at its height during the Great Muslim festivals, and that the dance was given recognition on such occasions seems very probable because the Portuguese had a dance called the “muchachim,” which may be the Arabic muwasim, the name of the six Muslim festivals, as we know from the ibn Battutah¹²² and al-Maqqari.¹²³

On the other hand, Pedro de Alcala (911/1505)¹²⁴ gives word muwajjah the plural of which is muwajjahin (mascarado con caratula), which Dozy and Engelmann link up with “los matachines,” a troop of four, six, or eight persons who performed a clownish dance.¹²⁵ This word is claimed to be derived from the Arabic mutawajjahin (masked people). That leads us to the Spanish words “mascara” (actor) and “zaharron” (merry andrew), which are the Arabic maskharah (cause of laughter) and sakharah (scoffer). Another figure of entertainment was the Spanish “moharrahe,” who was no other than the Moorish muharraj (buffoon).¹²⁶ It was the arts of these people which captivated the Moors and the Iberians alike,¹²⁷ and their influence spread abroad at the hands of the wondering minstrels.

It was these minstrels who were the real disseminators of music during the Middle Ages, for, as Naumann, says they were carrying new themes from one people to another, as well as many “an original and singular rhythm.”¹²⁸ This latter would have far-reaching effect, as we shall see presently. Even the Arcipreste de Hita (eighth/14th century) realized that it was not the bowed instruments which typified the exotic Moorish rhythms, but the plectrum-struck lute and pandore.¹²⁹ The other feature of that Oriental art was the mellisma or embroidery of the melody by Muslim singers and players which Professor Trend has well compared with the arabesque in Mudejar art.¹³⁰ The Spanish Courts were well supplied with Muslim players, singers, as the official records, even their names have been registered.¹³¹

That the wandering minstrel class contained a fair sprinkling of Moors, there is some evidence. It is probable that the long hair, painted faces, and gaudy raiment were prompted by Oriental minstrels,¹³² and the Spanish “mourisca,” already mentioned, with grelots on the dancers’ legs, and the “hobby horse,” both borrowed from the Moors, inveigled the ears and eyes

of audiences. The kurraj or hobby horse of the Moors and its impedimenta of bells (jalajil) are mentioned as far back as Jarir (d. c. 110/728) and have also been described by ibn Khaldun. Let us turn to the diffusion of these arts.

Some of the external features of the music of the Basques reveal a Moorish tinge. Their “mutchikoa,” which was danced by young men armed with batons, immediately suggests that the original was the Arabic muskwikah (bristling with arms). In Catalonia, there was a dance which specialized the water flagon called “almaratxa,” which was the Moorish almirashshah. That feature was dropped about 1215/1800. The Basque “zortzico,” also common in Spain, has a time measure of “five-eight” which immediately reminds one of the Moorish makhuri rhythm.¹³³ P. Donostia assures us that the “zortzico” “does not represent the musical basis of the Basque people.”¹³⁴

In other words, it is an exotic plant, reared among the Moors. Among the most popular of the Basque folk instruments are the “alboka” and “atabula,” the originals of which are to be sought in al-buqi and al-tabl of the Moors. Clearer still is the Moorish influence in the Basque “zamalzain” to which the people still skip about, little suspecting that it is the Arabic zamil al-zain (gala limping horse), the English “hobby horse.”¹³⁵

All of these neoteric devices soon spread over the Spanish and Portuguese borders, as the French, Italian, and English languages and customs reveal, some of them are to be found even today in Pyrenean provinces in something akin to their pristine character. One recalls that the tambourine made its entry into Western Europe as the “tambour de Basque” and “tambour de Biscaye.” Jean Poueigh, in his entrancing book on the Chansons populaires des Pyrenees francaises, shows how the popular song of some regions in France has been influenced by the Oriental art, and in his own particular sphere of research he hears and sees quite definitely the Moorish pattern.¹³⁶

Among his numerous examples in the “mouchicou” of Bearn, which is the warlike Basque dance “mutchikoa.” One of the Pyrenean song dances is a kind of “branle” called the amelet,” which had its origin in Toulouse in the sixth/12th century. There it fell into desuetude, although it may still be heard in the mountains of Foix. Could these binary measured song dances owe their name to the Moorish ramal? Yet the inherent wandering propensity of folk music is notorious, and one example of this is the Bulgarian rhythmic “aksak” which is to be found in Basque instrumental tune.¹³⁷ Its paternity is traceable to the Turkish aqsaq, a 9/8 movement.

In France, iconography supplies the clearest evidence of the Moorish and Saracenic influence in musical instruments,¹³⁸ whilst its literature clinches that certainty.¹³⁹ The Moorish ‘ud, rababah, qanun and tanbur, appear in the seventh/13th century as the “leus” (luth), “rubebe,” “micanon” and “mandore” - the Spanish “guitarra morisca” of Juan Ruiz (eighth/14th century), the “morache” of Guillaume de Mechain (c. 743/1342) in France. With these came the Saracenic naqqarah, tabl, and tabl-zan - the last meaning really “a drummer” - which were Gallicized into “naguarre”

(nacaire), “tabor” and “tabolzan.” Later, the French adopted the Persian tinbal as the “tinballe” in 876/1471.¹⁴⁰

French minstrels were welcomed at the Spanish Courts,¹⁴¹ and these as well as the peregrinating type were the means by which these Moorish instruments and music were spread abroad. The Spanish “mourisca” was danced in France as the “Moresque,” whilst “los matachines” were “les matassins” of that land, all of whom were “masques,” as did the Moorish maskharahs. As late as Thoinot Arbeau (997/1589), the French “Morris dancers,” i.e. Moorish Dancers,” were putting dye on their faces.¹⁴² He calls the “matassins” by the name “les bouffons” (Ar. muharrajat).

The troubadour problem, in relation to the Moorish influence, has been the arena of fierce conflict since the days of Heut’s *Origine Fabularum Romanensium* (1105/1693), as the present writer has shown elsewhere.¹⁴³ The discovery by Levi-Provencal in 1374/1954 that the fifth song in Jeanroy’s *Les Chansons de Guillaume IX* was not only inaccurately transcribed but that its final lines were actually purely Arabic,¹⁴⁴ was a veritable bombshell to the sceptics. Whether the troubadours actually borrowed their form and material from the Moorish mutrib (minstrel) or not, they certainly had the opportunity to do so.¹⁴⁵

Indeed, it is not improbable that the Provençal word “trobador” was coined from the Arabic tarrab (taraba = “to rejoice”, tarraba = “to sing”).¹⁴⁶ The orthodox explanation of the word is that it issued from the Provençal verb “trobar” (French “trouvere”) meaning “to find.” If that be so, it was a very lucky “find,” seeing that it gave birth to the verse of the troubadours. Joseph Anglade says¹⁴⁷ that the “trovador” who lived at the princely Courts was known as a “sergrier,” a name which was no more than the Moorish sakharah.¹⁴⁸ On the other hand, Menendez Pidal believes that the “segrier” belonged to a class between the “trovador” and the “juglar.”¹⁴⁹

In Pedro de Alcala (915/1509), the “trobador” equates with the Moorish sha‘ir (poet), nadim (boon companion), and adib (scholar).¹⁵⁰ There can be little doubt that the Moorish muwashshahah and zajal, which were popular verse forms as old as the fourth/tenth century, were the mould from which much of the poetry of the troubadour sprang, as Ribera has claimed.¹⁵¹ Even the scenes and dramatis personae of that poetry reek with the Orient. If they could borrow those features, why could not the melodies which enhanced that verse also be copied? In truth, they were almost inseparable. Even if the troubadours could not grasp the significance of the Arabic language they could at least seize the prosodical structure, the melody of which would be transfixed in their ears with certainty.

In any case, they had their “juglar” who attended them ostensibly for that purpose. Some of the later works of that early troubadour, Guillaume IX (d. sixth/12th century), “can be explained only by muwashshahah and zajal,” as Nykl insists, and he says of the later Marcabru that his two estornel (Ar. zurzur) were, “in all likelihood, made upon an Andalusianbilo” and “stanza” equate precisely with the Moorish markaz and bait. What is stranger still is the literal identity between the Latin musical term “conductus” and the Arabic majra, although we may not at present be able to pin the likeness down to precise identity of usage.¹⁵² What we do know for certainty is that

the Spanish “estribillo” and “stanza” equate precisely with the Moorish markaz and bait. What is stranger still is the literal identity between the Latin musical term “conductus” and the Arabic majra, although we may not at present be able to pin the likeness down to precise identity of usage.¹⁵³

Concerning the famous Cantigas de Santa Maria of Alphonso X (d. 683/1284), the miniatures of which present us with the delineations of many Moorish instruments, Julian Ribera has made wide claims for the Moorish influence in both the melodic and in the rhythmic structure of that work.¹⁵⁴ As his interpretation of the latter does not agree with the Arabian rhythms of the third/ninth to the fifth/11th centuries examples known to us,¹⁵⁵ that part of his elucidation is suspect, whilst his transcription of the melodies has been disputed by many.¹⁵⁶

On the other hand, the literary material which he amassed is extremely valuable to all who are interested in the problem. Yet the failure of Ribera, in the circumstances mentioned, does not validate the sweeping statement of Higinio Angles that there is not the slightest trace of an Arabian (Moorish) influence in the melodies of the Cantigas.¹⁵⁷ Others of the anti-Moorish influence party are more guarded in their utterances, since they admit that because there is not contemporary Moorish music available there can be no absolute proof either “for” or “against” that thesis. They evidently know the reason why there was no written contemporary Moorish music, seeing that the pious Cardinal Ximenes, according to his biographer Robles, committed a million Arabic manuscripts to the flames,¹⁵⁸ believing, as the late Reynold A. Nicholson has said, that he could “annihilate the record of seven centuries of Muhammadan culture in a single day.”¹⁵⁹

Spanish composers of the standing of Pedrell and Falla are outstanding opponents of the claims for a Moorish influence. The former asserts that Spanish music “owes nothing essential” to the Moors,¹⁶⁰ but takes care not to define what he means by “essential.” He prefers to acknowledge a Byzantine influence, but does not quote documentary evidence which he and others demand the pro-Moorish advocates should exhibit. In fact, there are no Byzantine documents of the pre-Moorish days that authenticate his contention.

Fella makes a different approach. He acknowledges the Oriental strain in Spanish music, but he attributes that feature of the “gypsies.”¹⁶¹ In other words, a handful of uncouth gypsies, who entered Spain not earlier than 846/1442, are to be credited with having exerted a more pre-dominant influence on Spanish music than a million Arabs and Moors whose ancestors entered the Iberian peninsula so far back as 94 - 95/712 - 713, without including the countless Mozarabes, Mudejares, and Moriscos, who had adopted the Arabian and Moorish mode of life.

The fact is that Spain is compelled to face the question of the Oriental strain in her national music as exhibited in the “cante hondo” and “flamenco,” but dare not acknowledge the influence of Islamic peoples. Jean Sermet says of the “cante hondo” that it “is certainly of Oriental origin,”¹⁶² while Raoul Leparra states that the “very special mentalite of the ‘flamenco’ goes back, according to the hypothesis most justified, to the domination of the Moors.”¹⁶³ Fortunately, there have been and are men of the stature of

Menendez Pelayo,¹⁶⁴ Mitjana Gordon,¹⁶⁵ Menendez Pidal,¹⁶⁶ Ribera,¹⁶⁷ and Nykl¹⁶⁸ who recognize clearly the Moorish influence as they would the sun at noonday.

The Moorish influence spread quite naturally to Italy, where such instruments as the “liuto,” “rebecca,” “canone,” “tambura,” “taballo,” and “nacchera,” as well as such terms as “maschera” and “mattaccino” reveal their ancestry.¹⁶⁹ Of course, the definitely Oriental Courts of Frederick II (d. 648/1250) and Manfred (d. 665/1266) at Palermo and Naples had their quota of “Saracen” minstrels and dancing girls.¹⁷⁰ A glance at medieval documents enables one to note the frequent appearance of Italian minstrels at Spanish Courts and vice versa,¹⁷¹ all of which conduced towards the interchange of alien ideas in music, including that of the Moors, which the poles asunder from that of Europe proper.

The Sicilian instruments of the period are displayed on woodwork screens of the sixth/12th century of Palermo, while those delineated by Fra Angelica, Bellini, and Montagna (ninth/15th century) are quite revealing of the Oriental influence in their ornamentation as well as in their shape.¹⁷² It was here that the mounted men-at-arms of the English condottiere, Sir John Hawkwood (d. 796/1394), were using a nacarino which was, of course, the Arabic naqqarah. Meanwhile, the crusaders had returned from Palestine with fresh ideas of martial music. Previously they only used trumpets (tubae, litui) and horns (corni, bucinæ), whereas the Saracens were equipped not only with trumpets (anfar, karnat) and horns (buqat), but also with large (kusat), medium (naqqarat), and small (qas‘at) kettledrums, together with reed-pipes (zumar), shawms (surnayat), cymbals (sunuj), and bells (ajras), which were used not merely for signalling but to create fear and dismay among the Christian array.¹⁷³

It is generally believed that the cylindrical bore “trump” of Richard Coeur de Lion, first heard in 587/1191, was borrowed from the Saracens.¹⁷⁴ With the latter the military band was a distinct unit known as the tabl khanah or “Drum House” which was drawn up with the standards away from the actual conflict, where it played unceasingly during the battle for tactical purposes. In times of peace it was the function of the tabl khanah to perform the five-fold naubah for the Caliph and the three-fold naubah for princes or governors. Generals, according to their rank, were allotted a specific number of players, although only the highest of the Amirs were allowed kettledrums.¹⁷⁵ Europe adopted all those customs, and up to the 13th/19th century the various ranks of European generals could be determined by observing the musical honours bestowed on them.¹⁷⁶

In Britain we observe the Oriental current flowing, presumably via France, as one sees in the word “mattachin,” the dance in which a duel was fought with wooden swords typifying the struggle between the Christians and the Moors. Here it was dubbed the “Morris dance,” but, as Brand points out, “the genuine morisco was very different from the European Morris.”¹⁷⁷ Each of the performers being a “masker” (Ar. maskharah), they painted their faces and wore masks. A folk-song and dance authority of today, Maud Karpeles, dismisses the Moorish origin of the British “Morris Dance” by saying it “is now discredited” - by whom, we are not told.¹⁷⁸

Such English authorities as Thomas Blount, Joseph Strutt, and John Brand had no doubts about its Oriental origin, and anyone who has seen the “hobby horse” and knows its history will scarcely be convinced by the latest heresy. “Moor’s garments” are specified in English documents as early as 914/1508 just as “Turk’s garments” for kettle drummers were mentioned a century later, the reason being obvious in both cases. With the general infiltration of Moorish instruments came the “lute,” “rebeck” of “ribible,”¹⁷⁹ “tabor” and “naker,” and they did not necessarily intrude through France, since both English and Scottish minstrels were welcomed at the Spanish Courts, where not only Moorish instruments were in common use, but Moorish minstrels were playing.¹⁸⁰

In the east there came the Turkish eruption into Europe during the ninth/15th century, when the whole of the Balkan Peninsula was conquered. That the music of the latter was influenced by that of the Turks can scarcely be denied, however much collectors of folk and national music may strive to minimize that persuasion. The Oriental strain exists to the present day, more especially in Bulgaria, Albania, and Yugoslavia. According to Raina Katzarova, the Turkish rule only left “infinitesimal traces in Bulgarian folk music.”¹⁸¹ Yet among those immeasurably small vestiges are many irregular Oriental rhythms from 5/16 through odd numbers up to 13/16. Further, did not those instruments of a definite Oriental prompting contribute something - if but the merest fraction - to those “infinitesimal traces?”

Those instruments include the “tamboura,” “kemence,” “kaval,” “daara,” and “tarabouka” - all adopted from the Turks.¹⁸² In Yugoslavia the Oriental impress is deeper, since many of their melodies are acknowledged to be of Turkish or Arabian origin.¹⁸³ The “tanburica” is common to the Yugoslavs together with its cousins the “saz” and “shargy.” The Arabo-Turkish lute (‘ud) is known in Macedonia as the “oot.” Among Balkan wind instruments, the “duduk,” “zurne,” “dzamare,” and “bore,” as well as the percussion group - “daule,” “deff,” “daulbas,” “daire,” “dalbujane,” and “chapara” - all tell the story of their parentage. Albania used a host of Turkish instruments, including pandores of the “yonghar” ad “paraduzen” class.¹⁸⁴

Even Rumania and Russia were influenced by the Turkish kopuz in their “kobsa” and “cobsa,” whilst the latter adopted the Arabian al-tabl, naugah, and tab-li baz in the tenth/16th century “litavri,” “nabat,” and “tulumbaz” respectively for their military bands.¹⁸⁵

Perhaps the greatest of all the “borrowings” from the Turks was made by European military bands. It began about 1138/1725 when the Turkish Sultan presented the ruler of Poland with a complete military band instrumented after the Turkish fashion. The craze soon spread to Russia, Austria, Prussia, France and Britain. The pre-dominant feature of this Turkish music was the use of the bass drum, cymbals, triangle, tambourine, and “Janissary bells.” These not only helped precision in marching for the army, but the new tonal colour attracted the attention of the orchestra, and very soon Mozart (1196/1781) and Haydn (1290/1794) were scoring for such instruments in their immortal works, the former using them in his opera *Il Seraglio*.¹⁸⁶

Indeed, the Orient became the scene for countless libretti: Beethoven’s *Ruin of Athens*, Rossini’s *Turks in Italy*, Webber’s *Abu Hassan*, Boieldieu’s

Caliph of Baghdad, David's Lalla Roukh, Bizet's Djamileh, Massenet's King of Lahore, Bantock's Pearl of Iran, and so on. What would the annual pantomimic productions in Britain be without Aladdin, Sindbad, and The Forty Thieves, all from the Arabian Nights, although some of us may be amused at the pseudo-Oriental music which accompanies them.

The musical influence of Islamic peoples is not confined to the West. South of the Maghrib and Egypt we find the tabl, ghaitah, bandair, and shaqshaq in the Sudanese languages as the "tabala," "tamba" or "tumbul," "algaitaru," "bendere," "bendo" or "bentere," "segesege" or "asakasaka."¹⁸⁷ The "azamari" or troubadours of Abyssinia may have derived their name from the Arabic al-zumar, meaning people who gather together to make music. Their agarit" is clearly the Arabic naqqarat. The neighbouring Somalis use the Egyptian zummarah as the "zomari," just as they do in Zanzibar, although it becomes the "anjomari" of Madagascar.

The lute-like qabbus of the Arabs and Turks became the "kabus'u" of Somaliland and the "qalbus" in Zanzibar. Turning to the west coast of Africa one recognizes the Arabic al-tabl and alghaitah, as well as the Turkish boru in the "tabulaie" of Senegal and the "a-tabule" of the Gold Coast, the "algaita" of the hausa, and the "buro" of the Gold Coast.¹⁸⁸ Returning to the east coast, it should be noted that, in spite of Sanskrit influence on the Malagasy language and the cultural pressure of Indianized Sumatrans, we do not find a solitary musical instrument of Indian or Indonesian origin. That statement takes us to India itself, where the Islamic cultural influences are as patent as the noonday sun.

A recent writer on Indian music avers that "the stories that tell how the various styles of North Indian music were invented by musicians of the Muhammadan period have probably no basis in reality."¹⁸⁹ So far as the "form," the method of performance, the actual instruments, and the technical nomenclature of that music is concerned, the above statement is a distortion. That some "styles" came via the "musicians of Muhammadan period" must surely be allowed, and among them are the qual, ghazal, taranah, and firu dasht. One recalls that Amir Khusrau (d. 725/1325) has been actually censured by the purists of the old Indian school of music for Islamic innovations, and one presumes that the above were among them.

The naqsh, an ornamental piece of music, was another feature in Amir Khusrau's time, and that and the preceding items would seem to be those specifically Islamic features which Alain Danielou believes that "no one can seriously speak of their having any influence" on the development of Northern Indian music. One asks, would that include the khiyal? Surely that deserves some claim to pristine utterance. It certainly lives up to its name, which means "fancy" or "imagination," since the embellishment of its melodic outline becomes perfectly scintillating at the hands of a Muslim ustad (virtuoso). Fox Strangways said that the khiyal received "its highest development" at the hands of the Muslims, having originated with a certain Mahmud Sharqi of Jaunpur (d. 844/1440).¹⁹⁰

The names of such modes as 'ushshaq and nigar, together with such technical terms as basit and sarpardah, are quite alien to Sanskrit. One is prompted to inquire why Sanskrit or Hindi words are not used instead of the

Arabic midrib for the “plectrum,” and khali for a “rest” in a rhythmic pattern. Why call the drum “brace” the diwal instead of its Sanskrit equivalent? Seemingly there is some “basis in reality” for the Muslim claims.

When we examine the musical instruments of modern India, we find overwhelming evidence of the influence of Islamic peoples, which is a sufficient rebuttal to Alain Danielou’s claim that “outside influences” were only “temporary fashions.” Nobody can scan the names and features of those instruments without concluding that Pakistan and parts of Muslim India have been wearing those supposedly “temporary fashions for many centuries. Search as one may in the old Sanskrit treatises, even Sangita Ratnakara (seventh/13th century), one will not discover in their pages the sitar, rabab, or tanburi.

Indeed, the chargah-sitar and tarabdar sitar bear an unmistakable Persian likeness. Even the sarod or sharod can be no other than the old Turkoman shahrud of the fourth /tenth century. All of these instruments as well as the dutarah and chartarah bear names which determine their origin. Grosset claims that the qanun or psaltery was derived from the old Indian katyayanavina or svara-mandala:¹⁹¹ but since the latter is not mentioned in the Sanskrit treatises earlier than the Sangita Ratnakara, which is of later date than the Arabic authorities, the claim for Indian priority is far from convincing. Among the bowed types the kamanchah is the most obvious of the borrowed Islamic instruments. The insistence of Grosset that the Sanskrit term kona stands for both “plectrum” and “bow” cannot be justified, although he claims the Amara kosha (first/seventh century) as his authority for the use of the “bow.”

Yet Ananda K. Coomaraswamy declares that “no Indian vina, whether ancient or modern, was ever played with a bow.”¹⁹² The antiquity of the ravanahasta as claimed by Fetis, who was foolishly influenced by the mythical ravanstron of the Sonnerat, was sheer imagination,¹⁹³ as was his indication of a manuscript at Vienna, dating from the days of the first Caliph (first/seventh century, sic), supposed to delineate a bow.¹⁹⁴ The Fetis design of a ravana and his so-called ravanastron and omerti are actually of Chinese provenance, as was his Indian tambourah.¹⁹⁵ The fact is that the earliest account of the function of the bow is given by al-Farabi.¹⁹⁶ Passing to wind instruments - the surna, alghuzah, moshuk, nafir, and karna - their very names confirm their origin, as do those of the percussion group - the tabla, tablik, naghara, duffda, and da’irah, however much some of these names may have been altered.¹⁹⁷

The music of the peoples of the Malay Archipelago was also influenced by India, especially Muslim India, on the instrumental side. The bowed rabab, or spike-footed viol, which spread with the adoption of Islam is known in the various islands as the “regab,” “repob,” “erbabi,” and “arababu.” The lute-like Arab qabus or qanbus and the Turkish qopuz appear as the “gambus,” “babbus,” and “kabosi,” whilst the surna or sunray becomes the “serunai,” “sarune,” “sruni,” and “sralai.”¹⁹⁸ Further north, when the Mughuls became masters of China (641 - 770/1213 - 1368), the instruments of Islamic peoples began to influence that land. Kuglai Khan

introduced an organ called the hsing-lung-sheng into China; it is being expressly mentioned as coming from the “Muslim kingdoms” of the “lands of the West.”¹⁹⁹

The armies of the Yuan rulers comprised large contingents from Turkestan, and a number of their Court officials were Persians. Was it any wonder that bands and orchestras of Muslim musicians should find favour at Chinese Courts? Here were to be heard such instruments as the “tan-pu-la” (Turki tanbur), “sai-t’o-erh (sitar), “huo-pu-ssu” (qopuz), “la-pa-pu” (rabab), “ha-er-cha-k’o” (ghijjak), “k’o-erh-nai” (qanun), ta-pu-la” (tabl), an “ta-pu” (daf).²⁰⁰ Thus, we discern how the Islamic arts in music traversed land and sea, covering continents and oceans, bringing to distant shores the indigenous music of several Near and Middle east peoples, which was not only fresh and novel, but had a comeliness and grace, a form and symmetry dissimilar from their own, some of which, wherever possible, were eventually absorbed.

Finally, there is the question of the influence of the music theorists of Islamic peoples - especially that of the Arabic theorists - in the practical and theoretical spheres of music. All historians of art and science have openly acknowledged the debt that we owe to Islamic peoples during the Middle Ages,²⁰¹ and one can include the science of music in Europe’s indebtedness, however small it may be, in our modern concept of obligation. Greece had always been a borrower from the East in the distant past. Even in the days of Byzantium she was absorbing from the Orient.²⁰² Yet with all the trumpeted fame of the Hellenic world, not a single treatise on the theory of music was produced - or at least has survived - from Anonymus II (fourth/tenth century) at the same time of Psellos (fl. 442/1050).

It was only the Arabic treatises on that subject which had currency from Seville to Samarqand, viz. those of al-Kindi and al-Farabi up to those of ibn Sina and ibn Zailah (d. 440/1048).²⁰³ One cannot help noticing the complete absence of genuine music theorists in Christian Europe from the pre-sixth century A.D. to the mid-third/ninth century.²⁰⁴ The reason for the decay has been described by the Muslim historian al-Mas’udi (d. 345/956). He says, “In the days of the ancient Greeks...and Byzantium, science was developed and scholars were honoured. Natural science was particularly studied...as well as the quadrivium, i.e. arithmetic, geometry, astronomy, and music...Then came the Christian religion, which...destroyed and blotted out the teachings of science. All that the ancient Greeks had placed before the world vanished, or was distorted. Among the noble sciences which were thrown aside...was the science of music.”²⁰⁵

This is not a biased picture by a Muslim. The facts can be proved up to the hilt by Christian historians who had the *ipissima verba* of the Fathers of the Church before their very eyes. Tertullian (d. c. 240 A.D.) decried Pagan literature,²⁰⁶ i.e. the literature of Greek and Latin philosophers, which was in strict accord with the authoritative Apostolic Constitutions which laid down, “Hold aloof from pagan books entirely.”²⁰⁷ Saint Jerome (d. 440 A.D.) was warned not to dabble in heathen literature,²⁰⁸ although he actually lamented that so few knew of Plato and Aristotle.²⁰⁹ Even Saint Augustine (d. 430 A.D.) pandered to his readers saying, “Heaven is for the ignorant.”²¹⁰

Cassian (d. 480 A.D.) reveals that the decrees against Pagan literature were still being observed.²¹¹ Even 60 years later Saint Benedict (d. c. 544 A.D.) recommends only the Bible and expositions thereon to be read by the Catholic Fathers.²¹² It has been admitted that “at no time have the general mass of Benedictines has learned.”²¹³

Under such conditions one can readily appreciate the total neglect of the works of the great Greek theorists of music. Europe knew of them only through fragments - often mistranslated as Roger Bacon affirmed - offered by Martinus Capella, Boethius, Cassiodorus and Isidore of Seville,²¹⁴ whereas the scholars at the House of Learning” (Bait al-Hikmah) at Baghdad had made Arabic translations of the works on music by Aristotle, Aristoxenus, Nicomachus, Euclid, Cleonids, and probably Ptolemy and Aristides Quintillians by the third/ninth century.²¹⁵ We have seen how both Euclid’s Canon and Aristotle’s De Anima had been the subject of Arabic commentaries (shuruh), and all were part of collegiate studies in Islamic lands, since music (‘lim al-musiqi) was part of the course of mathematics (riyadiyah), i.e. the quadrivium of the medieval European studies.²¹⁶

To appreciate the meaning of the impingement of Arabic learning - in the sciences especially - on Western Europe, one has to consider the prevailing cultural conditions there. In Spain, the hub of Islamic culture in Europe, we have Bishop Alvarus (third/ninth century) complaining that whilst his congregations could not pen a letter in their own tongue, they could accomplish mono-rhyme in Arabic,²¹⁷ while the ignorance of his clergy was deplorable.²¹⁸ At the centre of Europe’s intellectual culture - the Carolingian Empire - learning had so declined that studies had almost ceased, whilst at Cluny the subjects of the quadrivium were but little studied.²¹⁹ The Monk of Angouleme admits that “there existed in Gaul scarcely a trace of the liberal arts” before the days of Charlemagne, and it was no better in Rome, the very centre of Christianity.²²⁰

In Muslim Spain the cultural atmosphere was far different. Sa’id ibn Ahmad al-Qartabi (d. 462/1070) writes of that land thus, “The learned of al-Andalus exerted themselves in the cultivation of science, and laboured in it with assiduity.”²²¹ Ibn al-Hijari (d. 590/1194) testifies that under the Umayyad regime in al-Andalus (second - fifth/eighth - 11th centuries) “students from all parts of the world flocked...to learn the sciences of which Cordova was the noblest repository, to derive knowledge from the mouths of the doctors and ‘ulama’ who swarmed in it.”²²² What was taught specifically of the theory of music we do not know. The treatises of al-Farabi, the Iqwan al-Safa, ibn Sina, and the later Abu al-Salt Umayyah, ibn Bajjah, and ibn Rushd were available to all, most of these authors being known by their Europeanized names as Alfarabius, Avicenna, Avempace, and Averroes. (See H. Albert, Musikanschauung des Mittelalters, Halle, 1905, pp. 143, 169).

In spite of the destruction of Arabic manuscripts by Cardinal Zimenes in 898/1492 et seq., a few manuscripts on music theory have survived, notably that of al-Farabi, the “Major Book on Music” (Kitab al-Musiqi al-Kabir), now preserved at Madrid, being a sixth/12th century copy made for a

student of ibn Bajjah (Avempace).²²³ Al-Farabi's treatment of the physical bases of sound, also dealt with by the Ikhwan al-Safa, was a notable advance in that particular sphere.²²⁴ His description of the musical instruments of his day stands unique in the history of music. European theorists seem not to have considered the subject worthwhile. His minute account of the accordatura of the necked stringed instruments, the scales of harp-like instruments, and the compass and digit holes of the wood-wind family were subjects unheard of before his time,²²⁵ although al-Kindi had dealt with the lute in that fashion a century earlier.²²⁶

In a Persian treatise, the "Treasure House of Rarities" (Kanz al-Tuhaf), dating from the eighth/14th century, we have another example of the thoroughness of Islamic music theorists. In this we have not merely the musical gamut of an instrument described, but recommendations as to the style of fature, the best types of wood for use, an elaborate account of the manufacture of silk and gut strings, devices for amplifying the tone by means of sympathetic strings - the first account of its kind as well as the sprinkling of powdered glass on a glue covered interior of an instrument so as to improve the tone. The earliest mention of that device in Britain is a patent (No. 7454) taken out in 1253/1837. Ibn Sa'id al-Maghribi (d. c. 680/1280) says that books on "the various instruments and the art of making them are common among us," while in the days of Ibn Rushd and al-Shaqundi (d. 629/1231) Seville was the centre of the manufacture of musical instruments, and had an export trade.

How much of the Arabic material recorded above was translated into Latin we have no record. Yet seeing that Arabic was not only spoken by the Arabs and Moors, but also by the Mudejars and Mozarabes, who were, respectively, the Muslims who remained in the reconquered Christian Spain, and the Spaniards and Portuguese who lived under Muslim rule, much would have been passed on orally. One outstanding man in the former group was Muhammad ibn Ahmad al-Riquti, who, when the Christian armies took Murcia in 640/1242, was retained by the Christian king to teach in his schools, he himself being a famed as a music theorists and mathematician.²²⁷ That some of it was passed on via the Latin tongue or script we know from Anthony a Wood who says that when Roger Bacon lectured at Oxford, using faulty Latin translations, he was ridiculed by Spanish students, who have known the Arabic originals.

According to Bacon, there were few mathematicians among the Latins, and both he and Adelard of Bath strongly advised students abandon European schools and seek the fountain-head in Muslim Spain.²²⁸ Two Arabic tractates on the sciences which contained a section on music were translated into Latin, viz. al-Farabi's "Register of the Sciences" (Ihsa' al-'Ulum) and an anonymous "On the rise of the Sciences" (De ortu scientiarum), both of which became formal textbooks in European schools. Neither was of much value per se, since each merely outlined the bases of the study.²²⁹ Yet they were quoted by Gundisalvus, Magister Lambert (Pseudo-Aristotle), Vincent de Beaufais, Roger Bacon, Jerome of Moravia, Walter of Oddington, and others.²³⁰

The Islamic impact on musical instruments has already been shown, especially in the stringed variety with their frets. These latter were fixed according to the old Arabian system of ibn Misjah (d. c. 97/715), which was based on Pythagorean tuning, a circumstance which completely dispels the erroneous assumption of the Director of the “Museo-Laboratorio de Musica Marroqui” at Tetuan, D. P. Patrocinio Garcia Barriuso, that the music of Morocco, Algeria, and Tunis is not “Arabian music.”²³¹ As H. G. Farmer has been demonstrating for many decades, the “musica hispano-musulmana,” which he believes originated in Spain, was actually the old Arabian system of ibn Misjah, Ishaq al-Mausili, Ziryab, ibn al-Munajjim, al-Kindi, and al-Farabi, a “sistema model distonico y cromatico,” as he terms the present Moroccan music.

According to him - and his book has received the “Imprimatur” of the Roman Church - those “eminent musicologists” who have studied Moorish music have approached the subject with “prejudice, lack of knowledge, and impropriety of nomenclature,” when they have dubbed “Spanish-Muslim music” as “Arabian music.” So as to demonstrate the “superficial affirmation” of those erring musicologists mentioned above, he would enlighten the octave, of which Europe was an *au fait* so early as Sir John Chardin (1123/1711) and about the quasi-Arabian quarter-tone system, really Turkish, which succeeded in the 11th/17th century, the latter being illustrated by Dr. Barriuso, who copies a diagram from a music treatise of Kamil al-Khalu‘i (1322/1904), so as to prove that his “Spanish-Muslim” music of a thousand years earlier was not “Arabian music.” *O sancta simplicitas!*

So far back as the third/ninth century, when Christian Spain was in its intellectual childhood, the Baghdad scholars had translated from Greek into Arabic the *Muristis* treatises on the organ and hydraulic. Such works enabled the Arabs to construct similar instruments which led to some interesting results. An organ or hydraulic was being used in the Caliph’s palace at Baghdad in the time of Princess ‘Ulayyah (d. 210/825),²³² and there is evidence that organ constructors were known in Syria during the sixth/12th century.²³³ There is no reference to the hydraulis in the Orient since the time of Isaac of Antioch (fl. 459 A.D.), and in the Occident since the days of Apollinaris Sidonius (c. 483 A.D.),²³⁴ because the Greeks had adopted a weighted blast bag instead of hydraulic pressure.

Could the resurgence of the hydraulic in the third/ninth century have been due to the Arabic translations of *Muristis*?²³⁵ Amedee Gastoue says that “the makers of the first large organs in the Occident in the third/ninth century were, without doubt, either Greeks or Syrians,” and since he shows that the hydraulic had died by that time among the Greeks, the greater probability rests with the Syrians at the revivers.²³⁶

Returning to the question of the frets on the necks of stringed instruments, the Arab theorists used an alphabetic notation to designate the notes produced as those frets as we see in the “Treatise of Music” (*Risalah fi al-Musiqu*) of ibn al-Munajjim (d. 300/912),²³⁷ which the author specifically stated was based on the system of Ishaq al-Mausili (d. 235/850) who was the teacher of Ziryab (d. c. 238/852), the famous musician of Moorish

Spain. Europe, however, possessed no definite and practical notation of that sort. In its church music, neumes were used as a means of registering the melodic outline, but they did not convey any precise intervallic steps. By the time of Hucbald (fourth/tenth century), we find an alphabetic notation on very much the same lines as that of the Arab system, giving a major diatonic scale.²³⁸

No wonder that the latter has been attributed even to the Arabs,²³⁹ or to the Semitic Orient.²⁴⁰ It may also be pointed out that the instrumentalists of the minstrel class possessed a practical knowledge of music theory (*ad delectandos audientes artis ratione temperare*), whereas the church singers did not. This was stated by pseudo-Huebald.²⁴¹ Later, the Arabic influence on the alphabetic tablature for stringed instruments is openly admitted in a Latin manuscript entitled *Ars de pulsatione lambuti*²⁴² *et aliorum similium instrumentorum* (902 - 903/1496 - 1497) in which the tablature is said to have been "invented" by a "Moor of the Kingdom of Granada."²⁴³

Conde de Morphy said that Spanish lute tablature was "probably of Oriental origin," whilst his helper, Gevaert, more positively asserted that the Castilians and Aragonese "elaborated their tablature in imitation of that of the Muslims."²⁴⁴ Some other strange coincidences crop up in history. In his section on the "Eight Tones," Odo of Cluny (d. 330/942) attached names to the chordae which have more than casual interest because three of them are Arabic, viz., "schembs" (shams), "caemar" (qamar), and "nar" (nar).²⁴⁵ This terminology belongs to the doctrine of the ethos (tathir) as related to music, firmly believed in by Islamic peoples up to the present day.²⁴⁶ The General influence of Islamic culture on Gerbert of Aurillac (d. 394/1003) and Constantine the African (d. 480/1087) is not unworthy of notice. The former studied the mathematical sciences (matheses) at Barcelona, and that included music,²⁴⁷ which had been neglected in France.²⁴⁸ Indeed, he had been dubbed "Gerbert the Musician."²⁴⁹

Constantine was born at Tunis (Carthage), and then held by the Muslim Zairids. He spent 39 years in the East among the Chaldaens, Arabs, Persians, and Egyptians, and studied their sciences, including music. Because of his settling in Sicily and at Monet Cassino in Italy, his writings had considerable influence on European culture.²⁵⁰ One theorist who used him was Aegidius Zamorensis (seventh/13th century), a protégé of the Arabophile Alphonso X el-Sabio,²⁵¹ but a recent writer, Gerhard Pietsch, does not perceive any "Arabian influence" in his writings. Aegidius could scarcely have avoided the "Arabian influence" since we read in the incipit to his *Ars musica* that he learned "chiefly from Iraquian (Chaldaen) and Egyptian books."²⁵²

The music practiced by the Arabs and Moors also influenced Western Europe in other directions, notably in the melodic arabesque, organum, and the hocket. The arabesque or free embellishment of the melody (tahsin) was the art in which the Moorish virtuoso excelled. His "excesses" (zawa'id) - as those melismata were called - were usually vocalized on such words as ai or laili, which were introduced even into Spanish songs. (See E. L. Chavarri, *Musica Popular Espanola*, Barcelona, 1927, p. 36.) All sorts of tricks prevailed - the mabturah (staccato), istirahat (repose), shadhharah (short,

soft note), and the nabrah (a glottal catch like the coup de glotte).²⁵³ This last may possibly be the device hinted at by Magister Lambert, which Merchetus of Padua calls a “feigned voice.”²⁵⁴

On the other hand, it may have been the “embellishment” known to the Arabs and Moors as the shahajah (a whining sound), which was accomplished by the singers making a swift glissando from a low note to its fourth, fifth, or octave.²⁵⁵ This latter was in partial accord with the instrumental device known as the tarkib illustrated by al-Kindi under the name of jass, which meant plucking two lute strings with the thumb and forefinger.²⁵⁶ Ibn Sina gave the name tarkib only to the simultaneously struck fourth or fifth, whilst striking with the octave was called the tad‘if.²⁵⁷

In other words, he recognized the distinction between “organizing” and “magadizing.” It was that Arabian and Moorish tarkib, which, most likely, prompted the European “organum,” although with the Muslims the tarkib was, at that time, simply an “embellishment.” Today, the music of the Turkoman peoples is an “organum simplex” with the “diapente.”

The most significant influence by the Moors on the music of Western Europe was in mensural music. Neither the Greeks nor Romans were particularly interested in other than prose rhythms. With the Arabs, rhythmic modes (iqa‘at) in music, six in number, had existed since the first/seventh century, two or more were added later.²⁵⁸ Up to the third/ninth century the singer and instrumental accompanist observed the same rhythm, but Ibrahim ibn al-Mahdi (d. 224/839) and his Romantic school introduced schemes whereby a singer and the accompanist used different rhythms.²⁵⁹

When to that contrariety there was added a further diversity in the prosody (‘arud) of the verse, a performance became more than intriguing, and H. G. Farmer has given an illustration of that in an article on iqa‘at in the Urdu Encyclopaedia of Islam and in Grove’s Dictionary of Music (1374/1954).²⁶⁰ No wonder the Muslims referred to their rhythm as the “heartbeats of Allah,” for its content was infinite and boundless. Islamic music is fundamentally homophonic, and therefore quite different - in that respect - from that of Europe which is harmonic or polyphonic. Yet the Muslim seeks his harmony (muwafiqah) in the variegated rhythmical and prosodical structure of song and in the tonal differences of the rhythmic beats (durub). At first, such disparate things must have appeared to Christian Europe as a lucus a non lucendo.

Yet the time came when the Spanish singer and instrumentalist found themselves imitating the Moorish mughanni and mutrib in their rhythms. In the very nature of things the beats of the plectrum (midrib) on the lute or pandore strings, or the taps on the tambourine or drum, often left intermediate silences (sukun), which were the very anti-theses of the sustained notes of the melody. It was because of that circumstance that Europe - after it had adopted mensural music - called the Moorish iqa‘ by the name of cantus abscisus: hence Simon of Tunstede’s chapter called De truncationibus sive hoketis.²⁶¹

The latter word, “hocket,” “hoquet,” or “ochetto,” is simply a phonetic reproduction of the Arabic iqa‘at, a fact which European scholars only very tardily acknowledge,²⁶² although H. G. Farmer had claimed that derivation

as far back as 1344/1925.²⁶³ Most of them still adhere to the non-sensical - when it is not actually laughable - derivation from the English “hiccough” or “hiccup.”²⁶⁴ We see the same intrusion of the “h” in “hocket” as in Latin translation of Avicenna’s “Canon” (Qanun) where ‘ishq becomes “hash.” Of course, not all of the Moorish rhythms were borrowed by Europe.

Such an outlandish design as the makhuri of al-Kindi or the khafif al-ramal, both quintuple, were rejected, although Johannes de Grocheo (c. 700/1300) admitted that the music of the peoples was “not precisely measured,” and that included the Basque “zortzico,” which was also a quintuple rhythm. Curiously enough, the examples which only used two note values of the “longa” and “brevis” in “hockets” were dubbed musica resecata, whereas those which used many more note values were classed as hoquetus vulgaris, and this may imply that it was more used by the people at large.

The mention of note values and the popular “hocket” raises two vital points which deserve consideration. We are told by one of our leading musicologists, R. Thurston Dart, that in Europe “the first steps towards a convention establishing the duration of a note were made in the late sixth/12th century,”²⁶⁵ and there were only two or three duration values to notes in those days. Yet the Arabs recognized five different mensural types of sound at least, although they had no definite “notion” for the latter, save a cumbersome tablature and onomatopoeia,²⁶⁶ up until the seventh/13th century, when an alphabetic (abjadi) and numeric (‘adadi) notation or tablature was introduced.²⁶⁷

Concerning the hoquetus vulgaris, it is worth recalling what Jerome of Moravia (seventh/13th century) quotes on the authority of Franco of Cologne (fifth - sixth/11th - 12th centuries) who was the earliest of the mensural theorists. He affirms that the “hocket” was applied to songs which had already been composed, whether in Latin or in the Vulgar tongue, which means that the “hocket,” that is to say the Moorish iqa‘at, was a new device which was being applied to older material, notably the music of the people. Lastly we should remember that the approach of the Arabs and Moors in their iqa‘at and that of Christian Europe in their borrowed “hocket” were different; the former, because they viewed music horizontally, using rhythmic contrariety between the vocal line (prosodic) and the accompaniment (rhythmic), the latter, because they visualized music vertically and introduced those mensural features into three or four melodic parts.

European notation may also have received novel outlook from Arabian or Mozarabian sources, as H. G. Farmer pointed out in 1344/1925.²⁶⁸ One of the Latin mensural theorists, known as “Anonymous IV” of Coussemaker, mentions in the work entitled *De mensuris et discantu* (c. 674/1276) two technical terms, “elmuarifa” and “elmuahym,” as the names of notation symbols.²⁶⁹ The words are Arabic, although the first of them appears in the fifth/11th century *Glossarium Latin-Arabicum*, under the term al-ma‘rifah which equates with “nots.”²⁷⁰ It may be identified with the form al-ma‘rifah (cognition).²⁷¹ It is explained in “Anonymous IV” as having “a stroke on the left side in descending, just as the English depict it.”²⁷²

As for “elmauhym,” that word looks suspiciously like al-mubhim (shutting) or rather al-mubham (locked, closed).²⁷³ In the Latin translation of the Arabic of Euclid’s Elements the word “elmauhym” stood for the “rhomb.” We are told that some music scribes penned that note with a square head, whilst others made it rectangular. In one form it was a “plica” with an ascending and/or descending stroke (tractus). When it was written as an obliquely protracted line it was one of the “currentes” running notes), in which character it could be a “double, triple, or a quadruple ‘elmuahym’” - and could even be extended to sevenfold.²⁷⁴

The problem raised by this Arabic technical nomenclature is not easy to solve. One naturally asks, “Why were Arabic words used in a Latin work if there were technical equivalents in that language?” The author of “Anonymous IV” was certainly well acquainted with Pamplona and other Spanish works on the subject, and that Arabic terminology may have come through a Mozarabic scribe who would, in southern Spain, be acquainted with that language. Could we not assume that “elmuarifa” and “elmuahym” represented some new mensural devices in notation? Incidentally, “Anonymous IV” features both Leonin of Paris (sixth/12th century) and Perotin, his successor (seventh/13th century).

Gustave Freese sees in the “Currentes” of Leonin a synonymity with the “elmauhym” and “elmuarifa,”²⁷⁵ i.e. that it “may owe something to Arabian sources, by way of the troubadour influence,”²⁷⁶ whilst in Perotin, “the quick-moving upper parts would seem to suggest some troubadour and folk influence.”²⁷⁷ One of the last tributes to the music of Islamic peoples by A. H. Fox Strangways, the author of *The Music of Hindustan*, was to say this, “The Arabs, who taught to Europe their mathematics and medicine, have influenced our music in ways that we are only now finding out.”²⁷⁸

Yet whatever the “pros” and “cons” in the subject may be, both East and West agree fully in their praise of music, and Walter do Odington (eighth/14th century) quotes Avicenna (ibn Sina) side by side with St. Gregory, St. Bernard, and the Psalmist, saying, “Inter omnia exercitia sanitatis cantare melius est.”²⁷⁹

Chapter 59: Minor Arts

A

Anyone embarking on the study of Muslim arts would, during the course of his investigation and research, have to answer three fundamental questions satisfactorily.

(1) What is the reason for the surprising unity of style which we observe in works of art throughout the Muslim countries during a certain period?

(2) Why is it that a period of almost hectic artistic activity is followed, sometimes almost immediately, by qualitative decline and technical decadence?

(3) What is the reason for the remarkable success achieved by the Muslims in the domain of minor arts?

The answers to the first two questions rest on an appreciation of the relation-ship which existed between the artists of the Muslim countries and the rulers thereof.

The development of Muslim arts-major or minor-is related inalienably to the rise and fall of powerful dynasties of rulers. Every dynasty invited to its Court craftsmen and artists from all over the land under its sway. If an invitation was not enough, force was sometimes employed to compel their appearance. Under the Umayyads, the 'Abbasids, and the Fatimids, therefore, artists flocked to Damascus, Baghdad, and Cairo which alternately became centers of artistic activity, learning, and letters. Artistic traditions were developed and techniques perfected under the patronage of the rulers and the aristocrats. The middle class, obviously, had no say in the matter, and the artists kept themselves aloof from the masses.

As a particular dynasty fell from power and another emerged as its successor all the artists flocked to the new center of patronage, and overnight, as it were, the new dynasty "at one stroke inherited an artistic tradition that had been matured elsewhere." The transport of works of art themselves over great distances also helped to spread style and technique.

This answers more or less the first question. The second question is, per-haps, easier to answer. Since the development of arts was linked primarily with the fortunes of ruling dynasties, as soon as political conditions were disturbed at their center of activity, the artists deserted it and proceeded to other centers to put their fortunes to the stake. If a new dynasty arose which was capable of patronizing the artists and maintaining the artistic tradition, the artists' activity continued unabated, but if there was a period of chaos or political disturbance spread over a considerably wide area, artistic traditions had a tendency to evaporate into thin air. The artists de-prived of royal patronage could not produce great works of art and, thus, in a few years the tradition built up by conditions of stability and prosperity would lose force, and products of art suffer qualitatively. It may be observed that just as the decline of artistic traditions was amazingly swift, the stabilizing of artistic activity was also correspondingly quick. Now for the third question.

The line of demarcation between arts and crafts is admittedly fine. It necessarily follows that it is finer still between major and minor arts.

In the case of Muslim minor arts there is another factor which has to be taken into account, if we are to assess correctly the value and worth of the contribution made by the Muslims in this domain.

On account of certain restrictions imposed upon Fine Arts even where State patronage was available, there existed a lurking suspicion in the mind of the artist that he was working contrary to the precepts of religion. Since religion has always been a living force and a vital factor governing human activity, especially in the East, artists in Muslim countries were forced to adapt themselves to the conditions created by theological restrictions on Fine Arts and to devote themselves to the minor arts, such as calligraphy, carpet-making, wood-carving, etc. This is why we find that the Muslim peoples have achieved such remarkable success in the minor arts. The inspiration which would have molded works of Fine Arts was diverted into other channels. The Muslims, therefore, developed crafts indicative of such exquisite skill, superb craftsmanship, and artistic sensibility as is not to be found among the artists of any other nation, race, or country.

As a matter of fact, arabesque-a minor art of great importance-derives its name from those who originated and practiced it with great skill-the Arabs. Before we proceed to discuss in detail the phases of the various minor arts it would perhaps be expedient to take note of another remarkable pheno-menon related to artistic activity in Muslim countries.

It is generally believed that the fall of the 'Abbasids and the destruction of the Caliphate as a symbol of authority and a pivot of political sanction led almost immediately to qualitative decadence in the realm of major and minor arts. This is not the whole truth. As a matter of fact, the fall of the 'Abbasids did lead-as was usual in Muslim countries with the fall of a powerful dynasty-to qualitative decadence in the realm of art for some time immediately after the destruction of the Caliphate.

However, the opening up of the trade routes by the Mongols, the diffusion of cultural and artistic traditions generally, and the establishment of powerful dynasties which in-herited, as it were, the cultural and the artistic legacy of the 'Abbasid Caliphate, resulted after a century or so in the creation of conditions which were favorable to the birth of new ideas in the domain of art and were also responsible for the continuity of new artistic traditions which had come into being due to the diffusion of cultures and the admixture of civilizations as a direct result of the Mongol invasion.

This remarkable phenomenon of the development of artistic traditions can be observed to be occurring almost simultaneously under the Mughul rulers of India (933-1119/1526-1707), under the Safawids in Persia (908-1052/1502-1642), and the Ottoman Kings in Turkey during their most glorious period (768-1058/1360-1648).

B

Of the leading minor arts we shall consider one by one the following: (1) calligraphy and illumination, (2) book-binding, (3) pottery, (4) textiles and rugs, (5) wood-carving, ivory and bone-carving, and (6) metal-work, glass, and crystal.

1. Calligraphy and Illumination

The art of calligraphy or artistic writing can be divided into two principal types: (a) the Kufic, deriving its name from Kiifah where it was probably first used and (b) the naskh.

The Muslims have shown themselves to be worthy practitioners of both types. The earliest copy of the Qur'an which has come down to us is in Kufic characters. This style of calligraphy with angular letters remained popular for many centuries amongst the Islamic peoples.

After the fifth/eleventh century the Kufic script gave place everywhere almost invariably to naskh with rounded letters in sharp contrast to the angularities of the Kufic script.

The Muslim genius in Spain, having come in contact with Western influence, gave birth to another distinctive school of calligraphy known as Maghribi (western). This school is also known as Cordovan.

In Iran, after the Islamic conquest, the indigenous artists cultivated the scripts adopted by the Arabs and also the methods of illuminations which were then popular in other Muslim countries. The Iranian calligraphers, under the Great Saljugs, however, generally emphasized in their calligraphy the vertical as distinguished from the horizontal. The type of illumination and calligraphy found under the Saljugs is varied, rich, and extremely beautiful since the Iranian genius could fall back upon the tradition of Mani. Maui (third century A.D.) himself was reputed as an excellent painter, but his disciples were also well known for beautiful illumination and charming calligraphy. Specimens of the works of Mani's followers have been unearthed in Central Asia in the Turfan basin and it has become abundantly clear that the Iranian calligraphists and artists gave free reign to their indigenous genius while adapting the Arabic script and method of calligraphy.

The most beautifully illuminated copy of the Qur'an of this period was prepared by Abu al-Qasim in the fifth/eleventh century. It is preserved in the British Museum.

It was perhaps during the sixth/thirteenth century that a new school of writing was developed in Iran which was to be known as ta'liq: the characters in this type of writing tend to slope downward from right to left. Ta'liq flourished but naskh also remained in use especially in religious texts.

It is the irony of fate that the descendants of Hulagu, who was responsible for massacring millions of Muslims and killing the last 'Abbasid Caliph, became the patrons of calligraphy when they embraced Islam.

These convert kings known as 11-Khans of Persia had many fine works executed under their patronage. Uljaitu Khuda Bandah Muhammad was one of the most celebrated patrons of this art.

It was perhaps during the regime of 11-Khans (654-750/1256-1349) that illuminated pages of books were for the first time decorated with abstract ornamental designs. This may have been due to Chinese influence which permeated painting, and since calligraphy was considered to be a branch of painting, it was bound to be affected thereby. The illuminated manuscripts of this period show geometrical compositions of great beauty and charm, the favorite colors being gold and blue. It may be remembered that the use of gold-dust was a peculiar feature of the book-illuminations produced by

Mani's followers. There is no doubt that the Iranian artists never forgot their national heritage and used the background colors-mainly gold and blue-in sharp contrast to other colors in the foreground with great dexterity and sensibility.

It was during the rule of Timilrids in Iran that calligraphy really came into its own. The princes of the House of Timur were polished diplomats, skillful administrators, and celebrated devotees of Fine Arts. Their possessions were vast and the talent which mustered to their courts was correspondingly impressive. It was during their regime that the art of calligraphy underwent a revolutionary change and the Nasta'liq was invented which is a highly develop-ed type of writing combining the elegance, vigor, and charm of both Naskh and Ta'liq.

It is generally stated that Mir'Ali of Tabriz was the inventor of this type of writing, but most probably his calligraphy was the culmination of the fusion of the two types, namely, Naskh and Ta'liq-a process which must have been going on for a very long time. One of the princes of the House of Timor, namely, Sultan Husain, is justly celebrated for being one of the greatest .patrons of arts and learning. Sultan 'Ali Meshedi, the famous calligraphist, was a protege of his. Other celebrated calligraphers of the period were Ja'far of Tabriz, 'Abd al-Karim, and Sultan Ibrahim (son of 4h rah Rukh). The story goes that Sultan Ibrahirn was capable of writing in six different styles. A copy of the Qur'an written by him in 828(1424 is preserved in the shrine of Imam Rida' (Meshed, Iran).

In the domain of illumination also certain changes occurred after the Mongol invasion. Arabesque was interlaced with figures of grotesque Chinese dragons and fantastic imaginary plants. The use of gold-a remnant of the Sassanian tradition-however, remained a constant feature.

Calligraphy and illumination as developed under the patronage of the Timarids continued to flourish also under the Safawids, who were contempora-ries of the Great Mughuls and who gave to India the gift of miniature painting. One of the most famous calligraphers of the Safawid period was Mir 'Ali of Herat who prepared a manuscript of one of Jami's famous Mathnawis.

The art of the book-calligraphy and illumination-found its most worthy and celebrated exponent in Mir 'Imad Katib whose name for all practical purposes is even today synonymous with elegance, charm, and beauty of writing. He settled in Ispahan in 1008/1599 and copied for Shah 'Abbas many manuscripts revealing superb skill and unique craftsmanship. His rival 'Ali Rida' 'Abbasi-not to be confused with a painter of the same name, well known for his devotion to the Chinese technique of painting-also executed many works of beauty and elegance.

Illumination painted in gold also came into its own under the Safawids and reached the culminating point of the development of the Sassanian tradition. Mahmud, a celebrated painter and calligraphist of Bukhara, appended to his signature the cognomen Mudhahhib. Sikandar Munshi, the celebrated historian of the Safawid princes, opines that "Hasan Baghdadi was unmatched, un-surpassed, and unique in his time in the art of gilding.

In short, he brought the art of gilding almost to a miracle ... and the gilding of Bari cannot bear comparison with his minute and fine work.”

Several other techniques practiced by Safawid artists may here be named: stenciling in which the design emerges in the form of light or dark silhouette, de coupe work in which the design is cut out and then pasted on colored ground, generally blue.

Turkish calligraphists also achieved distinction but, as compared with the Iranians, their contribution does not appear to be very significant.

2. Book-binding

It is obvious that book-binder had played a very im-portant role in the preservation of valuable manuscripts before the press made it possible to produce mass duplicates of valuable works. It is quite possible that the bookseller was also the book-binder because it was one of his duties to ensure that valuable manuscripts are not destroyed or damaged by the passage of time. This view is strengthened by the fact that the word warraq means both a book-binder and a bookseller.

The earliest known book-covers of the Muslim period were made by Egyptian artists and we may safely assert that they may be dated from the second/eighth to the fifth/eleventh century.

Book-binding also reached its zenith under the Timurids. The artists of the Herat Academy executed leather work of great beauty and distinction, leather being the ideal material for book-binding.

The exterior of the cover generally shows stamped decoration with Iranian landscape, Chinese motifs, and arabesque interlacing.

Under the Safawids the book-covers were more decorative, and gold was used more abundantly. Gilded arabesque was interlaced with very fine and beautifully executed floral scrolls and Chinese cloud bands. Birds and animals were also represented, but, generally speaking, it was arabesque interlacing which was more emphasized.

Under the Safawids painted and lacquered book-binding also became the rage of the day. The process was as follows. The covers which were to be painted were given a coat of very fine plaster or gesso and then a thin layer of lacquer. This constituted the background for watercolor painting. Again, the watercolor was given several layers of lacquer so that climatic changes may not prove damaging to a fine work of art.

Ustad Muhammad was one of the most notable book-binders who painted lacquer covers. The Cartier Collection in Paris and the Royal Asiatic Society, London, possess some very beautiful examples of lacquered book-binding.

The Turkish artists, as usual, followed in the footsteps of their Persian brethren in book-binding, but, though their work was beautiful, it bore no comparison with the original and polished products of Iranian craftsmen.

In concluding this short note on calligraphy and book-binding, it is necessary to point out that book-binding and illumination in the West is indebted to the East. The Italian painters, book-binders, and artists, especially in Venice in the late ninth/fifteenth and tenth/sixteenth centuries, imitated Eastern technique especially that of the Iranian craftsmen, and

through them many Oriental motifs and decorative features were introduced in the West, the book-binding of which today is the envy of the East.

3. Pottery

There seems to be no doubt that Mesopotamia or the “Land lying between the two rivers” was the most important center of the potter's art even in the most ancient times. In the ancient kingdoms of Assyria and Babylon the potters were at their best, especially when using what is commonly termed as the “naturalistic style.” The Parthians (249 B. C. to 226 A. D.) whose language is known as Pahlawi, the forerunner of modern Persian, and the Sassanians (226-641 A. D.) who were justly celebrated for the grandeur of their architecture and the splendor of their monuments and inscriptions, liked their artists to express themselves in abstract patterns. Mr. Arthur Lane in his monograph, *Early Islamic Pottery*, would have it that the Assyrian and Babylonian traditions almost died out after the Sassanian times and that Islamic pottery developed in accordance with the technique current in the Mediterranean area and not with that in the Asiatic hinterland. It is difficult to agree completely with this assessment of the Near Eastern influences as they contributed to the development of pottery in Muslim countries be-cause when pottery came into its own in the third/ninth century it was in Mesopotamia that it found its most skillful exponents and designers.

Pottery fragments found in Samarra show signs of great skill and craftsmanship. Not only the variety of the different specimens of the potter's art found at Samarra is interesting and significant but it so appears that there were certain secrets pertaining to the manufacture of luster pottery which were known only to the Mesopotamian potters. These closely guarded secrets, however, became common property when the Mesopotamian potters migrated to the Courts of the Fatimid Sultans. By a curious anomaly of fate the descendants of these immigrant artists again came to Persia after the collapse of the Fatimids and brought to this country a skill which had been vastly improved in the congenial atmosphere of Egypt under the Fatimids from 359-567, 969-1171.

The conquest of the Near East by the Arabs was responsible for the evolu-tion of a new technique of the potter's art. In the beginning the Muslim potters followed in the footsteps of the local artists but, in due course of time, they became the originators of new and far more elegant and beautiful varieties of pottery.

Under the 'Abbasids, Iranian potters from the second/eighth to the fourth/tenth century achieved astounding success in their art and their products revealed such richness of pattern, warmth of color, and beauty of design as were never seen earlier. Usually designs were painted under a transparent glaze or over an opaque one. In the former case, the painting was usually over white or dark slips. Nishapor was a great center of this branch of art and excavations made reveal that even before the advent of the Saljfigs, the potter's art had achieved maturity if not that consummate elegance which was to characterize the products of the Saljaq period.

The greatest contribution of the Muslim potters is the luster technique. It would appear that the Muslim potters were infatuated with the patterns

created by light—"light mysteriously refracted by their luster pigment; light playing over a carved or subtly modelled surface; light gleaming through the glazed windows pierced in the walls of a vessel or through the translucent material itself," as Arthur Lane would have it.¹

Almost all historians suggest that it was the Chinese porcelain or pottery which inspired the Muslim artists, but it may be pointed out that, whereas the art of China is a little stilted and stiff, the pottery of the Muslims is at once "easy, harmonious and well bred."²

After Nishapour it was Kashan which became the center of the activity of the potters of the Saljiq period. It was here that the potters gradually learnt the art of manufacturing wall-tiles painted in luster. The origin of luster-painting is uncertain, but it would appear that it was first used in Egypt in decorating glass. Even if we concede that the Iranian artists of Kashan are indebted to Egyptian artists it does not detract from the originality and brilliance of their technique in manufacturing glazed tiles. If we compare the specimens of Egyptian pottery found in Fustat (it was at the same time a city of some importance under the Fatimid rulers) with Iranian pottery and glazed tiles, we arrive at the conclusion that the Iranian artists showed grater skill in execution and mature sense of color.

The glazed tiles of Persia, especially of Kashan, became so celebrated that the word Kashi is now a synonym for a glazed tile. The most beautiful works were executed by the members of one single family (602-735/1205-1334). Apart from tiles the Kashan luster-ware is justifiably praised for technical per-fection. The decoration is typically Persian-flowers and birds on the wings and interlaced arabesque. After the Mongol invasion, Mongol hats, Chinese dragons and lotus flowers also appear as a natural consequence of the fusion of the traditions of Chinese and Iranian arts. The three mihrabs in the sanctuary of Imam Rida' at Meshed are perhaps the most elegant examples of the Iranian artists' skill so far as glazed tiles are concerned. These were made by Muham-mad abi Tahir.

During the Mongol period lustered tiles were commonly used for the decoration of public buildings, mosques, tombs, and the houses of the great and the rich. Some of these tiles are cross-shaped, some rectangular, and some in the form of stars. It was during this period that another technique was evolved, viz., and the faience mosaic, which became very popular.

The technique of the Mongol era was followed by the artists of the Timurid period, but it may be observed that almost all types of pottery had suffered qualitatively. It may be due to the fact that the Chinese influence being predominant during this period, the artists, instead of reviving the indigenous traditions, tried to imitate specimens of art imported into Iran.

During the Safawid period Iranian artists continued to imitate the Chinese ware and the imitation was sometimes so skillful that the copy was mistaken for the original. Even the decorations consisted of Chinese landscape with typical birds, animals, and foliage, especially legendary dragons and serpents.

In the time of Shah 'Abbas the Great the art of lustre-painting, however, was revived by the potters of Isfahan. Typically Iranian decoration came into vogue. Iranian landscape with birds, animals, and foliage came into its

own. The products of these Isfahani potters show great originality and can be clearly distinguished from the imitations of Chinese pottery, especially in porcelain.

Turkish and Egyptian potters also continued to execute beautiful works of art, but there is no doubt that supremacy rested with the Iranian artists.

Gradually, industrialized Europe excelled the East even in the field of pottery, and the Persian market was flooded with white earthenware from Staffordshire.

4. Textiles and Rugs

(a) Textiles under the `Abbasids, Tulunids, and the Fatimids of Egypt (second/ eighth to sixth/twelfth century).-When the Arabs conquered Egypt in 21/ 641, the weaver's art began to undergo a change of great artistic significance. In the early stages, the Copts, who were really very skillful technicians and weavers, were pressed into the service of the Arab Caliphs and noblemen. They taught and practiced the weaver's art in royal factories, known technically as Tiraz factories. It is necessary to point out at this juncture that the term "Tiraz" was used for (i) bands containing woven or embroidered inscriptions, (ii) embroidered garments and clothes, and (iii) institutions where such garments were manufactured. Unless this three-fold significance of the word "Tiraz" is kept in view, one is liable to get confused.

The importance of the Tiraz factories may be gauged from the fact that many of these were situated in the very homes of the Caliphs-palaces and State mansions.

The Tiraz factories, having been established in Egypt and working under the skillful guidance of the Copts, produced linens and silks of very fine quality. The city Tinnis near Port Said had 5,000 looms and was justly celebrated for producing fabrics of great excellence, such as Kasab, Bukalimun: the former was used generally for turbans and the latter with amazingly changing colors for saddle cloth and for covering the litters for the Caliphs. Every year the 'Abbasid Caliphs sent a covering for the Ka'bah at Mecca known technically as Aiswah manufactured by the craftsmen of the Royal factories established in Tuna. Another city famous for its silks was Dabiqi; the term "Dabiqi" is men-tioned very often in Persian lyrics and Arabic odes. Fustat or old Cairo was also a celebrated center of the weaver's art.

During the regime of the Fatimids, the Egyptian craftsmen surpassed their Coptic masters. The linens and silks of the Fatimid period became so elegant and fine that they were exported to all parts of the civilized world. Generally speaking, the Fatimid artists followed the artists of the `Abbasid regime in the sense that they used either geometrical patterns or figures of animals for decorative purposes, although the Kilfic writing was also observed flanking the decorated pattern. When naskh replaced the Kilfic script, the linen and silk fabrics were decorated with arabesque motifs and the cursive writing of the naskh.

The linen textiles on which decorations and inscriptions were painted or stamped were even more skillfully manufactured. These inscriptions were occasionally in liquid gold, again reminding us that the Sassanian traditions

were very strong even under the Fatimids. The technique of stamping and printing decorations on fabrics was developed to such an extent by the Fatimid artists that it spread to Europe, and the Germans showed great skill in imitating the artistic patterns and motifs of the Egyptian Muslims.

(b) Textiles of the Ayyubid and Mamluk Dynasties.-From the sixth/twelfth to the eighth/fourteenth century, the weaver's art continued to flourish but signs of decline were occasionally noticed. As a matter of fact, the decorations of this period are simple as compared with the superbly executed Fatimid, embroideries in polychrome silk or gold thread.

Stamping and printing were also practiced in accordance with the traditions inherited by the artists. There was a departure in the manufacture of silk which deserves mention. During this period the silk fabric was usually woven with a shuttle on a draw-loom in sharp contradistinction to garments and fabrics with tapestry-woven decorations wherein the weft threads of the designs were introduced with a bobbin or a needle. With the advent of the Mongols and even earlier, the Chinese technique began to influence the weaver's art. It would appear that the Mamluk Sultans of Egypt especially favored the Chinese style of decoration.

(c) Iranian Textiles-When Tiraz factories were established throughout the territorial possessions of the Caliphs, Iran was no exception. As a matter of fact, the Iranian craftsmen who had inherited the traditional skill of the Sassanian craftsmen very soon adapted themselves to the new conditions and began to produce incomparable works of art. During the earlier period Merv and Nishapour housed famous Tiraz factories.

The Iranian artists of these cities produced silk textiles which appear to have been influenced by the fusion of many artistic traditions-the Sassanian, the Coptic, and the Egyptian. The use of the gold thread is certainly reminiscent of the Sassanian traditions, while the decorative patterns bespeak of Coptic influences. History is curiously silent about the place occupied by Samarqand so far as textiles are concerned, but in literary works we find many allusions to the beautiful fabrics, silks and linens, woven in this great city which witnessed the emergence of the Persian renaissance and which under the princes of the House of Saman became a great center of intellectual activity, learning, and cultural movements.

Under the Great Saljuqs, the Iranian artists proceeded from strength to strength. There was a revival of almost all crafts and minor arts, and Ray during this period became the most celebrated weaving center. The Sassanian tradition lost its hold, and, slowly but steadily, arabesque motifs of Islamic origin with finely executed scrolls came into their own.

It would appear that Baghdad also was a famous center of the weaver's art during this period, since Marco Polo (seventh/thirteenth century) praises the silks, linens, and gold brocades of Baghdad and Mosul. Allusions in works of literature would tend to show that weavers in this period had spread all over the territorial possessions of the Saljuqs: it has been proved beyond any shadow of doubt that many fine brocades, silk fabrics, and linens preserved in European museums were manufactured in Asia Minor, especially at Qunyah.

It is an admitted fact that the Mongol invaders of Persia patronized the craftsmen and the artisans and massacred the learned and the erudite, con-sidering the latter as useless appendages of civilized life. Amazingly, however, very few Iranian textiles can be assigned with any amount of certainty to the Mongol or Timfirid period. M. S. Dimand has pointed out that many brocades attributed to Iran by Falke are most likely of Spanish origin. The matter, however, is not free from doubt. All that we can assert safely is that the weavers continued to flourish under the Mongols and Timfirids; unfortunately, however, very few genuine fabrics manufactured by them have been preserved.

As with other branches of art, Iranian weaving blossomed forth into its full splendor under the Safawids who had become infatuated with craftsman-ship of all types except that of words since poetry excluding the elegy was looked at askance by them. Safawid silks were primarily of three types: (i) plain silks, (ii) silk brocades, and (iii) silk velvets. All the three types were most elegant and were used commonly for the garments of the rich, as hangings and curtains of palaces, and as gifts from the Safawid princes to those who deserved them or who had the good fortune of being present when the kings and princes were in their high spirits during festivities or celebrations.

The decoration of these fabrics is almost typically Iranian-animals moving about gracefully, birds on the wings or perched on branches and foliage moving or still as in breathless suspense. The Iranian artists painted even scenes taken from the famous Persian romances or the epic of epics, the Shahnameh. Nizami seems to have been one of the most favorite authors; inci-dents from the stories that he weaves have been interwoven by the weavers into silks and fabrics manufactured for their royal patrons and generous nobles. Linens, brocades, and velvets of this period are to be found in many museums all over the world and appear amazingly fresh, spick and span, glowing with life, with warm and soft colors.

Under Shah `Abbas the Great who was a generous patron of all Fine Arts, artists manufactured textiles of great beauty in Yazd and Kashan. Some of these fabrics have come down to us and we know also the names of some artists, for example, Ghiyath and his son. All critics and historians of art agree-and it is very refreshing to observe this agreement-that the velvets and the brocades manufactured under the Safawids, especially during the reign of Shah `Abbas, constituted the most glorious fabrics ever produced in any part of the world.

Under the Safawids the Iranian artists also developed the art of embroidering and printing cottons. Many specimens of block-printed cotton hangings known technically as *galamkar* have come down to us and it appears that they were made most probably in Isfahan, Hamadan, and Yazd.

(d) Turkish Textiles and Embroideries.-The fabrics of the Ottoman period consisted mainly of finely made brocades and velvets, but it may be observed that the decoration of these fabrics is far less skillful and varied than of those manufactured by the Iranian or Egyptian artists. The Turkish artists almost invariably confined themselves to floral and geometrical patterns. However, Turkish textiles are important in the sense that the artists

of Venice imitated the Turkish craftsmen and, slowly but steadily, this art spread to Europe via Italy.

Turkish artists were very fond of embroidering handkerchiefs and towels, and it is obvious that they were used merely for decoration or ceremonial purposes. Most of them belong to the twelfth/eighteenth and thirteenth/nineteenth centuries.

(e) Indian Textiles.-The Indian artists of antiquity were justly celebrated for manufacturing cotton muslin so fine as to be considered miraculous.

When the weaver's art came into its own under the Moghuls, both Iranian and Hindu motifs became clearly discernible in fabrics manufactured in India. During the period of Shah Jahan very fine velvet was produced. The decoration consisted primarily of floral scrolls.

Silk brocades were the specialty of the Indian artists under the Moghuls. We know on undisputable authority of Abu al-Fall and others that Lahore, Aurangabad, Benares, and Ahmedabad were great weaving centers. Silk brocades were very skillfully designed with vivid colors and abundant use of gold. The elegant saris and head-dresses and sashes (shash) manufactured during the Moghul period have been justifiably claimed to be specimens of the finest weaving in the world: some of them are to this day preserved in museums.

Europe knows Indian textiles most probably through Kashmir shawls, some of them embroidered and others woven.

The art of block-printing and resist-dyeing reached its zenith under the Moghuls. Specimens of printed cotton known to Europe as palampores and pintados were beautifully designed and executed with great skill and ingenuity.

(f) Rugs-Although fragments of rugs have been excavated at Fustat in Egypt which would show that rug-making was very well known to the Egyptian artists, yet there is no doubt that it was only with the advent of the Saljugs that fine rugs were manufactured for the first time. Marco Polo, who passed through Asia Minor in 669/1270, informs us that the most elegant rugs in the world were made by Greek and Armenian artists under royal patronage. It is surprising, indeed, that the Saljugs Turks, barbarian by origin, were responsible for reviving many major and minor arts throughout their territorial possessions. The Saljug rugs have simple decorative patterns-interlacing arabesque, geometrical figures, and medallions.

As is the case with textiles, very few rugs of the Timurid and Mongol periods have come down to us, but if we closely observe the rugs as represented in miniature paintings and as described by poets, we have to concede that the art of rug-making had achieved considerable maturity under the Timirids. As a matter of fact, spring with all its beauty, colors, and abundance of flowers and foliage is described by the poets as inferior to the decorated rugs found in royal palaces.

The finest Iranian rugs were manufactured admittedly under the Safawids. Tabriz was the center of Iranian arts and crafts and it was here that the weavers of Kashan, Hamadan and Herat would learn the craft of rug making and go back to their homes to spread this artistic activity throughout the possessions of the Safawids.

The most celebrated types of rugs manufactured under the Safawids may be grouped as follows: (i) medallion and animal rugs with arabesque and floral designs, (ii) woolen rugs with animal figures drawn, with the greatest skill, realistically and not in stilted conventional manner, (iii) silk rugs, (iv) rugs with floral designs, and (v) vase rugs.

Under the Moghuls rug-making or carpet-making in India became very favorite with kings and princes and Abu al-Fadl, eulogizing Akbar, writes that "all kinds of carpet weavers have settled here and drive a flourish-ing trade. These are found in every town, especially in Agra, Fatehpur, and Lahore."

Some of the Moghul rugs have been preserved, particularly those in the collection of the Maharajah of Jaipur. Dimand is of opinion that "in technical perfection the Indian weavers of the time of Shah Jehan often surpassed their Iranian Masters."

Turkish rugs are mainly of two kinds, (a) manufactured by royal factories with all facilities attendant thereupon, (b) made by ordinary villagers and peasants who occasionally grouped themselves with industrial ends in view. The design of the Turkish rug is mainly geometrical and this characteristic can be traced even in the peasants' productions right from the tenth/sixteenth to the thirteenth/nineteenth century.

Some time back a series of beautifully designed rugs of different sizes with floral patterns was wrongly attributed to the skill of Damascus craftsmen, but recent research has established beyond any shadow of doubt that these rugs are the products of Turkish looms; many technical specimens of these are to be found in the Metropolitan Museum. Rugs bearing floral patterns and designs may safely be assigned to Court manufactories, especially those established by Sulaiman (906-974/1500-1566) in Constantinople or Brusa (Asia Minor). Obviously, the rugs made by the peasants are comparatively coarse and their patterns and designs clearly show that the sensibility of the designers was not fully developed.

There is no doubt that these Turkish rugs, whether manufactured by artists attached to the Court or by peasants, are, on the whole, inferior to the Persian rugs of the Safawid period which were brilliantly conceived and superbly executed as works of art.

5. Wood-carving, and Ivory and Bone-carving

(a) Wood-carving.-There is no doubt that the Muslim artists during the early centuries of Islam developed the art of wood-carving under Hellenistic and Sassanian influence.

The most celebrated specimen of wood-carving produced during the early 'Abbasid regime is the prayer pulpit in the mosque of Qairawan situated in North Africa which, it would appear, was brought from Baghdad during the third/ninth century along with some lustered tiles by some notables of the Aghlabid dynasty. This pulpit contains panels decorated with geometrical patterns and designs. It is regarded as a masterpiece of wood-carving of the Baghdad School and was most probably executed under the patronage of Harun, the `Abbasid Caliph. The abstract art of modern times would benefit to a great extent if its exponents study carefully the fine patterns and designs executed during the early 'Abbasid period.

Gradually, the `Abbasid artists developed a style of their own and freed themselves from the fetters imposed upon them by the Sassanian and Hellenistic conventions. The 'Abbasid style of decoration was imitated by the Egyptian artists under the Tulunids (324-359/935-969) and it became very popular in all parts of Egypt, especially in Cairo.

The craftsmen of Egypt, however, gradually improved upon the `Abbasid technique and evolved out a style of their own in the fourth/tenth century. The motifs “were more deeply undercut and there was a tendency towards roundness.”

It is extremely difficult to estimate the part played by the ancient crafts and arts of Egypt in the development of wood-carving by the Egyptian artists. After all Egypt had inherited artistic traditions of great significance and value and it would perhaps be safe to assert that the artists must have benefited from the heritage of ancient Egypt.

With the passage of time geometrical patterns gave way to other types of decoration, namely, the carving of animal figures and arabesque scrolls; the devotion to detail in these works is amazing and is indicative both of the skill of the artist and of his painstaking labor.

Some of the panels of wood made during the Fatimid regime are magni-ficently carved and depict typically Egyptian scenes; the figures of birds or animals are emphasized and this is but natural because the ancient Egyptians worshipped certain birds and animals as gods and goddesses.

During the Ayyubid period the Fatimid tradition continued to influence wood-carving with the difference that arabesque scrolls became more delicate, fine, and complicated, and nasj h replaced Kiific inscriptions. With the passage of time the devotion to detail which has already been noticed was emphasized still further. It was in this period that various valuable types of wood including ebony came into use.

The art of carving in Egypt declined in the ninth/fifteenth century.

The wood-carver's art in Iran showed signs of considerable maturity even during the regime of Mahmnd of Ghaznah; a door from his tomb has been preserved, ironically enough, in the Museum at Agra. This door reveals that the Iranian artists evolved a style of their own and arranged the deep undercutting of the ornament in several planes. This characteristic feature is undoubtedly of Iranian origin.

Wood-carvings of the Saljug period have, unfortunately, not come down to us in sufficient quantity to enable us to evaluate their artistic worth but it may be safely asserted that the artists of Asia Minor during the sixth/twelfth and seventh/thirteenth centuries produced works of very high quality the decoration of which compared favorably with that of the Egyptian and the Syrian artists.

Wood-carvings pertaining to the early Mongol period are also very rare but there is no doubt that in the second half of the eighth/fourteenth century the Iranian artists, especially in Western Turkestan, achieved a technical perfection which leaves nothing to be desired.

The art flourished for some time under the Safawids but in the eleventh/seventeenth and the twelfth/eighteenth centuries signs of decline were

notice-able: during this period the panels were painted and lacquered, not carved.

(b) Ivory and Bone-carving.-Ivory and bone-carving of the early Islamic period has been found at various places in Egypt, especially in old Cairo, and shows that Coptic traditions influenced the work of the earlier artists to a large extent. Artists flourished under the Fatimid, Ayyubid, and Mamliik dynasties. Decoration during this period was very elaborate and finely executed.

Sicilian ivory-work has also been preserved in certain museums and it reveals a fusion of the Eastern and Western styles. The decorative motifs are mainly arabesque, human figures, animals, birds on the wings and perched on the branches of trees with dark somber and sober outlines and occasional flashes of vivid red, bright violet, blue, and dazzling gold.

6. Metal-work, Glass and Crystal

(a) Metal-work.-The Sassanian tradition in Iran was so strong that the earlier products of Muslims, particularly silver and gold vessels, have been attributed mistakenly to the artists of the Sassanian era. However, it is easy enough to distinguish earlier Islamic metal-work from the Sassanian because vessels which are decorated with Kiiiflic inscriptions, birds, interlaced arabes-que, and medallions are definitely of Islamic origin. It has been conjectured- and there seems to be merit in this conjecture-that the earliest products of the art of metal-work pertain to the period of the Samanids who were res-ponsible for heralding the Persian renaissance in letters, learning, and Fine Arts.

Early Islamic vessels consist mostly of trays and ewers fashioned in the shape of animals and birds.

With the advent of the Saljuq Turks in 429/1037 Muslim metal-work came into its own. The bronze, gold, and silver utensils which have been preserved in different museums reveal patterns and decorations which are extremely original and seem to have been developed by the artists of the Saljuq period. Enamel-work was also known, although it was not of very high quality. Gold jewelry of a considerably high standard consisting mainly of ear-rings and pendants, fashioned again in the shape of animals and birds, has come down to us. During this period both Iran and Mesopotamia became centers of the art of casting bronze objects with relief decorations-mirrors, plaques, and animal figures. Two mirrors which have come down to us (preserved in the Harari Collection in Cairo) reveal that the artists devoted great care in the execution of their work and paid painstaking attention to details.

Metal-work during the Fatimid period consists mainly of jewelry and is relatively very rare. Some specimens are to be found in the Harari Collec-tion mentioned above.

It is interesting to note that some of the metal-work under the Ayyubid Sultans is decorated with Christian motifs.

Although artists in metal-work continued to flourish during the Mongol period and after, signs of qualitative decline were apparent.

Under the Safawids, however, the metal-workers achieved great distinction in moulding iron and steel and produced works of art which are

technically perfect and in no way inferior to the earlier masterpieces. Unfortunately, very few specimens of Safawid metal-works have survived, but in the tenth/sixteenth-century miniature paintings we can observe the elegance and charm of some of the metal-works represented therein.

The artists of other Muslim countries did not achieve any great distinction in this art as compared with the Iranian artists.

(b) Glass and Crystal.-During the Roman period the artists of the Near East, particularly Syria and Egypt, were justly celebrated for their skillfully executed glass-ware. The Muslim artists learnt the various techniques of decorating glass from the local artists.

Excavations made at Susa, Rayy, and Sava have given to us specimens of glass-work which prove that the Iranian artists continued to walk in the footsteps of their Sassanian masters and even copied the Sassanian forms and decorative features.

The glass-work of the earlier Islamic period consists mainly of bottles, flasks, cups, and receptacles for oil and perfume. The earlier works were un-decorated but with the passage of time the artists learnt the art of decoration and produced works which were exquisitely beautiful. Especially charming were the small thick prismatic perfume bottles.

Under the Fatimids the glass industry reached its zenith. Excavations at Fustat and Alexandria have revealed that the artists had achieved great skill in this art and developed technical perfection. The greatest distinction achieved by the artists of the Fatimid period was the decoration of glass with luster-painting and enamel. It is unfortunate indeed that this type of work has come down to us only in fragments.

Some pieces, incomplete as they are, in the Arab Museum in Cairo, the British Museum, and the Berlin Museum, each decorated with beautiful scroll work and abstract geometrical patterns of Kufic inscriptions, sometimes painted in brown luster and sometimes in silver, reveal great skill.

The cut decoration was also perfected by the Fatimid artists.

There were signs of deterioration of this art under the Mongols and the Tienfirids and it was under Shah Abbas the Great (996-1039/1587-1629) that glass-making again reached technical perfection most probably due to the impact of the West, especially the influence of the Italian art. It would appear that Shiraz and Isfahan were the greatest centers of the glass-maker's art.

After the Safawids, industrialized Europe gave the quietus to this branch of artistic activity in the East.

Part 3: Social Studies

Chapter 60: Historiography

Chapter 61: Jurisprudence

Chapter 60: Historiography

The debt that history owes to the efforts of Muslim writers is generally recognized by Orientalists, but the consciousness of the value and significance of the Muslim contribution is rare among Western historians. Every known sizable collection of Islamic manuscripts includes a good proportion of historical works¹ which in itself is a fair indication of the importance attached by Muslim scholarship to history. A comparison between the outputs of historical literature by the Muslims before decay set in and the Islamic civilization began to decline and the histories written during or before that period by other peoples will show what great interest was taken by the followers of Islam in history. A similar comparison in the standards achieved will be equally illuminating. It would be no exaggeration to say that in the Middle Ages, history was very much a Muslim science. Their contribution is even more remarkable in view of the fact that the Muslims had inherited very meagre traditions on which they raised so glorious an edifice.

For several decades the Orientalists were not impressed with the Muslim traditions regarding the magnitude of ignorance in pre-Islamic Arabia. They saw in them an endeavor to exaggerate the achievement of Islam by belittling pre-Islamic Arab effort; even the silence of Muslim writers was suspect. Partly for this reason and partly with the desire to belittle the success of Islam in uplifting the Arabs, the Orientalists made strenuous efforts to find proofs of pre-Muslim attainments, but they did not discover much. In the words of a recent authority, “the cultural and economic level of the nomad population was, as it has always been, too low to support any literary effort.”² The Arabs did produce some poetry, a fact mentioned and recognized by Muslim authorities, but they had little conception of other branches of literature. They do not seem even to have a word for history. Some of the earlier writers have used the term *akhbdr* for history; the singular form, *khbar*, is used even today for a report or information.

This has been the meaning of the word in Muslim times; the earlier meaning of this word is obscure. As the name implies, *akhbdr* is generally understood to mean a string, a collection, or, at best, a connected sequence of reports, and only in the last form does it achieve the form of a historical narration of events. The origin of the word *tdrikh*, which is now generally used for history, is even more difficult to trace. Its root form perhaps came to be used in the Yaman in the pre-Islamic days, but, in all probability, it referred to time, not to history.³ This significance of the word has not yet been lost; indeed, the word *tdrikh* is used more often in the meaning of a date than of history.

It is obvious that with-out even a proper word for it, the Arabs could have little conception of history before the advent of Islam. They had a few stories of what they had considered to have been important or interesting events and vague, probably untrue, legends of the peoples who had inhabited the old ruins that were scattered in some parts of the peninsula. They lacked even a proper epic; indeed, they were a people with no consciousness of history. The Muslims, therefore, could not have drawn any

inspiration for the development of a tradition of historiography from the pre-Islamic Arabs.

The Greek sciences made a most significant contribution to Islamic culture, but in the field of history, the Greek influence is difficult to trace. No classical Greek history ever reached the Arabs; the Greek and the Latin annalistic literature has been lost and is not available even to the modern scholar.⁴ History, however, was a much less important sector of Greek and Latin scholarship; it was not considered of sufficient merit to be included in the curriculum of regular studies. The Muslims adopted the branches of learning that were considered to possess sufficient importance in the eyes of the Greeks themselves; the Greek tradition was kept alive in these subjects. One of the reasons for the loss of classical Greek historical literature may be the fact that the Arabs showed no interest in its preservation.

The Byzantines had traditions of historiography and it is not beyond the range of possibility that some of their works came into the hands of the Arabs through Syrian Christians and converts to Islam. They might have contributed some techniques, but these techniques could not have been important.⁵ In any case, the Arabs could not have derived their historical sense from the Byzantines.

The other two great civilizations with which the Arabs came into close contact were those of the Iranians and the Hindus. The Hindus never developed an interest in history. There is little indication of the Iranians possessing any notable historical literature at the time of the Muslim conquest.⁶

It is, therefore, more likely that the Arabs developed a sense of history as a result of the Prophet Muhammad's mission. Indeed, all indications point in this direction; hence they need exploration. It should be remembered that Islam itself claims to work in the context of history. It fulfils the previous missions of the prophets who had come before Muhammad.⁷ It seeks to abrogate the excrescences that came to disfigure truth in the course of time, because the generations that had gone before had failed to preserve the earlier revelations.⁸ Prophets had come in various societies at different times and had preached the same essential truth, but there had grown up errors and misunderstandings, some deliberate and perverse and others as the result of folly, and divine revelation had become clouded. Now this basic belief shows a consciousness of history. It is concerned with the past, the present, and even the future.

The future comes in because Muhammad being the last of the prophets⁹ and the bearer of a message of transcendent importance, his mission will remain effective throughout the future. This conception of religion is not concerned with the present only. It does not look upon the present as merely transient, nor upon the past as the sum total of merely so many transient and insignificant presents. This is borne out by the fact that the Qur'an draws attention repeatedly to the misdeeds of previous peoples and their destruction as the result of these misdoings.¹⁰ The warning is implicit in the narrative itself, but it is also given explicitly on many occasions. If the past produced all those disastrous results, or if, conversely, virtuous deeds in the past were fruitful in producing good results, there is a relationship between

the past, the present, and the future which is significant in fashioning human life. History, in this manner, achieves great importance in understanding life.

There is another aspect of Islam that has an important bearing upon history. Muhammad has 4 unique place in history. According to the Muslim belief, Muhammad stands, as if it were, on the watershed of time. The progress that had been vouchsafed to humanity before him was to find fulfilment in his mission. The previous messages were limited to particular peoples and their environments and conditions. They had the special circumstances of these people in view; hence they had contained, in addition to an emphasis upon the universal nature of the absolute values, certain teachings that were valid only in the circumstances in which they were revealed.

The succession of the previous prophets had worked for the completion of religious belief, for a perfection in the unveiling of the great truths, and for giving humanity the essence of religious truth, untrammelled by the need to circumscribe it by a consideration of the transient environment. Muhammad, thus, represents the culmination of one divine plan and the beginning of another. The first plan was designed to meet the differing needs of various segments of the human race, the second plan for the entire humanity. The very pattern of religious progress changes after Muhammad, because now there is a universal message to follow, the essence indeed of all that has gone before.

With this belief about the position of the Prophet in time, it was natural that the Muslims should cultivate the historic sense. Christianity also believes in a divine plan of history; indeed, the Church, encouraged by the power and expansion of the Christian nations, came to believe strongly that it was the will of God that Christianity should prosper in the world and in this manner the Kingdom of God should be ultimately established on earth. Only recently with the growth of communist States has this belief somewhat weakened. However, even when the Church held a strong conviction regarding the ultimate triumph of Christianity and looked upon history as the gradual revelation of the divine plan, its conception of the importance of the unfolding of the historical processes was not the same as that of the Muslims.

According to the Christian dogma, Christ is the man-god; he did come at a particular time in history, but that time has no special significance because, as God, Christ is eternal, timeless, and infinite. Only for the time that he was in this world, did he put upon himself the limitations of a finite human existence. He came to redeem the world and he did it by paying for it with his own life. In a sense this redemption is the culmination of religious evolution. It was for this reason that the earlier Christians saw in every disaster the approach of the end of the world. Having been redeemed, the world had achieved the goal; there was nothing beyond it. The further unfolding of history was irrelevant.

The Muslim position was basically different. The Qur'an enjoined that there should be a body among the Muslims dedicated to the task of preaching the truth¹¹; indeed, the Muslims themselves were to form a nation

to invite others to accept the truth and to set an example for the world.¹² Muhammad was the last of the prophets, but his mission was to be carried on by the learned among his people. It was for this reason that he had said that these learned people were to be like the prophets of Israel; in other words, what had hitherto been achieved through a succession of prophets was to be accomplished through the agency of learned men.

This sharp contrast between the destiny of Islam and the earlier religions was bound to set people thinking about the elements responsible for this change in the divine plan. How had the world changed to need a new dispensation so radically different, in its purpose from what had gone before? This question was even more pertinent since it was not the nature of the truth that had changed; for did not Islam claim to be all revealed truth, whether it had come before Muhammad or through him? And what was the truth that had come before? How far did it conform to the message of the Qur'an?

How much of the truth claimed by the previous religions was interpolation, and how much of it incidental to the circumstances of those days and the peoples who had been its recipients? These were the questions that arose naturally, and all of them are either directly historical or have historical overtones. They were rooted not only in natural curiosity, but, as we shall see later, also in theology itself.

In its exhortations for belief and righteousness, the Qur'an does not depend entirely upon appeal to emotions. It argues and appeals to reason at innumerable places. Phenomena of nature, legends contained in older Scriptures, the impact of ruined cities and buildings upon the imagination of a sensitive people, and historical events are all pressed into service. Indeed, there are considerable historical data in the Qur'an.¹³ The inclusion of these allusions in large numbers led the critics of the Prophet to question the relevance of human experience in the past. They dismissed them as being merely the records of peoples who had gone before.¹⁴ The unbelievers implied that what had happened in the past was of little importance to them. They certainly did not believe that history had any lessons for them.

The Qur'an, on the other hand, considers the experience of the past generations and of other peoples to be of vital importance. The underlying argument is that similar actions and circumstances produce similar results. The Qur'an thus lays down one of the first principles that guided the Muslims in their study of history. They wanted to learn from the experience of others. Besides, human activity is not an isolated phenomenon; it is linked with the past as much as with the future. Being implicit in the very conception of Muhammad as one of the prophets and the last of them, it found confirmation in the insistence of the Qur'an on the importance of historical phenomena in the determination of right and wrong.

If any human action has brought disaster, that action could not be right except as the vindication of the principle of righteousness itself. And in judging the results of human activity, the Qur'an does not take into consideration the individual. It is the sum total of communal activity which cannot be right if it produces disasters.¹⁵

A good man working for the common good in a bad community may suffer, but he has his other rewards. A bad man in a good community may not suffer, but he has his other punishments. This is the reason why prophets and martyrs seemingly failed in bad communities which hurled themselves into disasters; from a purely worldly point of view they even suffered grievously, but actually they were saved and the evil-doers really suffered. And in the stories of the bad communities and the suffering prophets, there is another implication. The good that the prophets had sought to achieve might not have been established in their own times or communities but it ultimately did prevail, and this shows a continuity of the historical process in which righteousness ultimately wins.

Apart from their moral and philosophical implications, which helped in creating a historical sense in the Muslims, the historical allusions in the Qur'an presented a challenge to the Muslim mind. The Muslims wanted to learn more about them, and thus began a search for more detailed information. It is true that with their limited resources and the condition of human knowledge in their days, the information collected by the early Muslims was not always accurate. Considerable legendary material, folklore, and mythology entered into their understanding of the historical facts mentioned in the Qur'an. A fertile source of legendary material was the Jewish tradition. The net gain was that historical curiosity had been aroused. Some of the earlier mistakes were never corrected, but others were discarded when critical faculties got sharpened by greater experience and knowledge.¹⁶

There was yet another aspect of religion that directly led to the cultivation of history. Muhammad is a historical figure; he lived in the limelight of history. His biography has always been considered to be a cornerstone of Muslim theology¹⁷ and, therefore, the events of his life were eagerly sought and collected. So long as his immediate disciples and Companions were alive, this was a simple matter, but as time elapsed, it was considered increasingly necessary to collect all information about him. Where the believers could not find clear guidance from the Qur'an, or where there was dispute in the interpretation of its text, the best authority could be the Prophet's actions and sayings.

Thus, there grew up the tradition of collecting the ahadith, and after some time when the original narrators had died and there had intervened several generations so that for every hadith there were several narrators in succession, it was necessary to submit the reports to searching criticism. The scholars developed canons of criticism that have not only endured but have earned the respect of the succeeding generations for their soundness¹⁸

Modern scholarship can find fault with some of the traditions that have been judged to be sound, but the canons of criticism and of testing the validity of reports are trustworthy even today. This was no mean achievement and shows not only a keen sense of responsibility but also a high perception of the criteria which should be applied to any narration. After all this is the kernel of all methods of historical research.

A by-product of this search was the compilation of working biographies of all the better known narrators. In this process those considered unreliable

were branded as such. The biographers made the most careful and impartial scrutiny, and if they found any trace of deceit or even a charge of lying in any respect, they exposed the narrator so that the traditions, in the chain of the narrators in which he appeared, might at least be treated with extreme caution. As it was a theological and religious matter and concerned the beliefs of all Muslims, the critics developed the highest sense of intellectual honesty. Despite these efforts and precautions, some unreliable traditions have found their way into the “authentic collections,” but when it is remembered that the collectors discarded many more traditions than were considered sufficiently sound to be accepted, it would be clear how well the criteria were applied.

A remarkable testimony to the historical sense of the Muslims is their success in preserving the text of the Qur'an. It really arose from two of the teachings of the Book itself. The first of these is the doctrine of the corruption of the previous Scriptures through changes or interpolations. The other is the promise that the Qur'an shall be preserved.¹⁹ According to the Muslim belief, the corruption of the previous Scriptures resulted in the misguidance of the people to the extent that the shape of the original faith was changed beyond recognition. The Muslims had been given the Qur'an, which they were to cherish and preserve in the original form. They believe in the verbal sanctity of the Qur'an. This led them to preserve the text. Taking into consideration the differences in languages in the Muslim world and the rise of various sects in Islam, this is quite an achievement. The preservation of the text of the Qur'an could not but have engendered a respect for the texts of documents of any importance.

It would be seen from this discussion that historiography in the Muslim world had religious beginnings. It was religion that gave the Muslims their historical sense, and the requirements of developing a theology made it imperative for the Muslim theologians to undertake historical research and to lay down canons of evaluating historical data for eliminating doubt and error so far as it was humanly possible. It led them to explore the traditions of religions allied to their own which had preceded the mission of the Prophet in point of time. Indeed, historical studies started in Islam as a necessary adjunct of theological development²⁰. It was necessary, therefore, for the Muslims to cultivate a religious attitude towards history, which could not be discarded easily. Indeed, even when history ventured out into the courts of worldly monarchs, it was not able to overcome some of the conceptions developed in the cloisters of the mosques and the colleges of theology.

The theologians looked upon their work as an act of worship; hence it was to be approached with the utmost sincerity. In such work all merit was lost if any selfish motives were permitted to interfere with its objectivity. The scholar considered himself to be accountable to God for every fact that he reported or any opinion that he expressed.²¹ Indeed in the beginning he was doubtful whether he was justified in expressing an adverse opinion about anyone.²² However, he was strengthened by the Prophet's example of not hesitating from censuring a person in the public interest, or from expressing an opinion that would save others from trouble and hardship.²³

In the reporting of facts and the expression of opinions, therefore, the writer felt himself bound by the ethics of a witness or a judge. He would not report anything about which he was not certain; he would weigh all the evidence at his disposal and try to adjudicate fairly upon the merits of the report and the character of the narrator. He would not be a party to the perpetuation of a false report. In reporting a tradition of the Prophet he was conscious of the Muslim belief that the Prophet had strongly forbidden his followers to ascribe a saying or a tradition to him falsely. Therefore, he wanted to avoid at all costs any participation in such an act. The secular historians unhesitatingly imbibed these ideas and adopted the same attitude in their fields.²⁴

This attitude created high standards of objectivity. Indeed, quite often objectivity was carried to ridiculous extremes. Not a few books written by Muslim authors are dry and jejune chronicles of events without any comments or value-judgments. The authors felt that it was their duty to narrate the events and that it was the business of the reader to arrive at his own conclusions. They did not believe that the historian's function was to narrate the facts as well as to interpret them. Such an attitude was crippling for a proper develop-ment of history as a social science. There was, however, a brighter side to this objectivity, a scrupulous regard for the truth. Even when history was written with a political objective in view, the facts were not mutilated.

The best examples are furnished by two Muslim historians of the Indo--Pakistan sub-continent. Abu al-Fadl wrote the Akbarnameh with the blatantly clear object of extolling his patron, Akbar.²⁵ Mulla 'Abd al-Qadir Badayuni, on the other hand, wrote his Muntakhab al-Tawarikh, it seems, to prove to the world that Akbar had strayed away from the right path. Shorn of the propaganda against Akbar, Badayuni's book is merely an avowed redaction of Nizam al-Din Ahmad's Tabagati Akbari. Badayuni has added information about Akbar's lapses from his personal observation and also from hearsay.

The general effect is pretty damning from the orthodox Muslim point of view. On closer analysis, however, it appears that Badayuni has suggested more than his words really convey, and, being a master of studied ambiguity and innuendo, he is able to create impressions without taking responsibility for some of the events that he reports. Wherever he is reporting an incident or a fact that is obviously not correct, he prefaces it by a vague remark like "It is reported that...." Sometimes he writes sentences that can be translated in more than one way.²⁶ Such ambiguity, however, occurs only where the author deliberately seeks to suggest what he does not want to say. This was not done for any fear of the monarch, because Badayuni's book was kept secret during Akbar's reign.²⁷

It was Badayuni's regard for the verbal and the literal truth that led him into these devious paths. He was perhaps not bothered about the general effect because he was probably convinced, as were several other men of high repute, of Akbar's heterodoxy. Badayuni left the path of historical rectitude only in heightening an effect that he considered to be true. Abu al-Fadl, who approached his task with an entirely different purpose, is hard put

to it where he finds it difficult to justify or explain away some measure or action of the monarch. He adopts the method not of ignoring it, but of making a veiled reference to it that a discerning reader can well understand. Abu al-Fadl, his general panegyrics apart, shows a high regard for truth in reporting events. He was probably also convinced of the truth of the general theme of his work, namely, that Akbar was a monarch of unusual ability and that he was inclined to show remarkable benevolence towards his subjects.

Whatever axes the two authors had to grind are, however, quite apparent to the reader, but he cannot help being impressed by the pathetic regard for truth that is so apparent in these works and that is so difficult to maintain because of the patently partial approaches of the authors. These are perhaps extreme examples, but they are by no means unique in the history of Muslim historiography. Nizam al-Din Ahmad, whose work has been mentioned above, provides a good example of the extreme objectivity observed by some Muslim historians, because, living in the midst of such acute controversy regarding the monarch's religious policies and attitudes and himself being orthodox in his own religious beliefs, he does not even as much as mention the topic. He could not have considered it unimportant, being an observer of good sensitivity, but he left it out because he did not want to pass value-judgments on matters which he disliked.

The Muslim monarchs were extremely sensitive regarding the verdict of the posterity on their deeds. They had the common human weakness of being desirous of leaving a good name behind them. Historians were, therefore, courted and patronized. A number of histories have been written by men who in varying degrees can be called "Court historians." In some European circles their works are treated with suspicion, which is not justified in all cases. We have seen how men of probity have not twisted facts even when they seemed to mar their own thesis; at worst, they may have been guilty in some instances of the suppression of some unpalatable truth or the suggestion of virtues that did not exist. They could not have invented events.

Their faults can mostly be remedied easily-any hyperbolic praise of a patron is understood to be merely a matter of form; the pure and unabashed panegyric can be easily dismissed as being out of context.²⁸

When a weakling is called a world-conquering hero by a writer, it is understood that the epithet is only an expression of courtesy conveying nothing, but a Muslim historian does not invent imaginary victories to adorn sober history. If a historian misses some event, he knows that others are likely to mention it and that he will be held guilty by posterity; therefore, there are few instances of deliberate misrepresentation by Muslim historians, and these have often been corrected by subsequent writers or even their own contemporaries.

The historians who had access to monarchs and their ministers were well informed and to that extent are more reliable. In an age when the printing press had not made the daily newspaper possible and governments were not publicity-conscious in the modern sense of the term, the isolated scholar was hard put to it to collect the necessary data for an informative book relating the events of a reign. One has only to compare the bazaar gossip

related by European travelers to India with the sober histories of the period to see how distorted the reports of events did become once they had left the pre-cincts of the Court and the circles of persons in contact with the high officials.

A Court historian was in no less desperate a position than a historian of today who is overwhelmed by the information material issuing from the publicity departments of modern governments, especially when his own emotions are also deeply involved, e.g., in a crisis in which his own nation is concerned. The Court historian had his own reputation at stake because he intended to write for posterity. The professional code established by histo-rians could not be transgressed with impunity.

However, not all historians who were otherwise attached to a Court can be called Court historians. There have existed men of the highest probity who were attached to Courts and wrote historical works, but they cannot be termed Court historians. Amir Khusrau enjoyed the patronage of several monarchs but he was not employed as a historian. Badayuni, while attached to Akbar's Court, wrote against him. Nizam al-Din Ahmad held a high office in the government, but the recording of history was not one of his duties. It is doubtful whether even abu al-Fadl can be called a Court historian in spite of his great par-tiality for Akbar, because his official assignments were of an administrative or military nature.

The famous Abmad bin Yabya al-Baladhuri was a nadim of the Caliph al-Mutawakkil; 'Ata bin Muhammad al-Juwaini was a wazir; other government officials who were also historians of some eminence include Muhammad Yabya al-Siili, Sinan bin habit, Abu 'Ali Abmad bin Muhammad Miskawaih, and Salah al-Din Khalil bin Aibak al-Safadi, to name only a few. The great ibn Khaldun was a Qadi, but this was not considered so much of a government office as a religious obligation to be discharged by those quali-fied for it if they were called upon by the monarch to assume the responsi-bility.

There were some princes and rulers who took an interest in history and wrote works of considerable merit. An outstanding example is Isma'il bin 'Ali Abu al-Fide' who, in the midst of the busy life of a statesman and soldier, found time to write authoritative history. The 'Abbasid prince Abu Hashim Yosuf bin Muhammad al-Zahir wrote a history of the reign of his brother, al-Mustansir bi-Allah. Some of the rulers of the Yaman, like Jaiyas bin Najah (d. 501/1107), al-Afdal al-'Abbas bin 'Ali (d. 779/1377), and al-Ashraf Isma'il bin 'Abbas (d. 805/1402) were responsible for historical works.²⁹ None of these can be called Court historians, nor are their works prejudiced because of their high offices.

Diaries and memoirs are a fruitful source for historical studies. Indeed, some memoirs are our mainstay so far as the historical information regarding some areas at certain times is concerned. In this category come the memoirs of Zahir al-Din Muhammad Babur, whose stormy life presents not only one of the most exciting studies in history, but also gives us an insight into the political conditions of Central Asia after Timur's Empire had collapsed. He is rightly known as the prince of all diarists because of his frank narration of events, in which he also discloses his own humane

personality, telling us in a most charming manner his weaknesses and recording his triumphs with-out any bragging. He hides neither his elation at success, nor sorrow at his defeat.

This chiaroscuro of victory and defeat, of weakness and strength, of lapses and piety, and of ambition and frustration reveals a sensitive and lovable personality possessed of artistic sensibilities, all of which makes the Tuzuk extremely readable in addition to being informative. To take another example, his great grandson, Nur al-Din Muhammad Jahangir, also wrote his memoirs. Jahangir had known no adversity; his tale could not be so thrilling as that of Babur;' besides, he wrote not as an ambitious adventurer, albeit crowned and of imperial descent, as Babur did, but as an established ruler of a great empire. And yet, Jahangir's memoirs do not show any lack of sensitivity. He is as keen an observer of human character as his illustrious ancestor was, as artistic in his own manner, being one of the greatest patrons of art, and an excellent critic and connoisseur. In spite of the inherent pomposity in the writing of an emperor who knows that his book will be read by his subjects even in his own lifetime, the book does not lack obvious sincerity.

These examples can be multiplied from other periods and other lands in the context of Muslim historiography. The main point is that the suspicion in which certain Western writers uncritically hold any writer associated with a Court is not justified. Those who transgressed the requirements of historical objectivity were forgotten and subsequent scholars and historians did not fail to criticize or even condemn them for their lapses. In the words of Diya' al-Din Barani, "it is necessary that the historian be ... known and famous for his truth and just dealing" and when "he writes of the excellences, the good deeds, the justice and equity of the ruler or of a great man, he must also not conceal his vices and evil deeds. ...; the attention of the truthful, pious, and sincere historian should be directed towards writing the truth. He should be in fear of answering on the Day of Judgment.... In sum, history is a rare and useful form of knowledge and its writing is a great obligation.³⁰

As the writing of history was looked upon as a religious duty, the highest objectivity and impartiality were its criteria in the mind of the Muslim historian. There were black sheep as well and sometimes the desire for gain or the fear of a tyrant overcame the sense of responsibility of the writer, but he generally was relegated to oblivion.

Muslim historiography took several forms. The pre-Islamic Arabs took great pride in their genealogies. Like other primitive peoples, they generally kept verbal records which on some occasions were even publicly recited. Of course this often resulted in bragging and was a fruitful source of tribal war-fare and vendetta. The practice of maintaining genealogies was kept up under Islam as well, and many non-Arab families seem to have adopted the habit. It is unlikely that in the pre-Islamic period the Arabs bothered to remember the main events connected with the life of every ancestor. Some famous anecdotes or events might have been associated with some outstanding names, but an idea of a connected family history or biography, however sketchy, of even the better known men in the family tree was

unknown. It is even more improbable that any of these genealogies were committed to writing in the pre-Islamic period. The main features of these genealogies were fairly well known even outside the group of those to whom a genealogy belonged and any fraudulent claim was soon countered. In a way this was the early Arab way of remembering their tribal origin, but it had little to do with real history.

When the Muslims took up historiography, genealogies proved helpful in understanding the part played by the Arab tribes in Islamic history. With the growing participation of the non-Arab Muslims in the affairs of the Islamic world the genealogical pattern came to be discarded in the greater part of the Muslim world. The origin of the genealogical works like Zubair bin Bakkar's *Nasab-u Quraish* was the exaltation of the Quraish; this was feasible because the ruling dynasties of the Umayyads and the `Abbasids were alike Quraish. Baladhuri's *Kitab al-Ansab* is the classical example of history being dealt with from the angle of genealogy. However, with the inclusion of so many non-Arab peoples in the world of Islam and their rise to power, such treatment became obsolete. It, however, thrived in the Maghrib, especially in Spain, because tribal considerations continued to play an important part in the area and history could be grouped around the activities of some tribes and clans. Private families, particularly some of the 'Alids and Hashimites, were interested in keeping a record of their ancestry.

Family histories have continued to be written up to this day. Most families, however, contented themselves with keeping their genealogies in tabular forms. *Shajarahs* were quite common in the Muslim world, but they cannot be classified as history. The Arabs, however, were given to tribal fighting which continued for considerable time and had the tendency to be rekindled at the slightest pretext. The memory of a spectacular or significant victory was kept alive. The battle-day tradition occupied an important place in the folklore of early Arabia. Those who had distinguished themselves in a battle or had inflicted a humiliating defeat on their adversary continued to brag about it long after. In fact, scholars are inclined to think that this form of narration was common to the earlier Semites as well. It is present in the older sections of the Bible.³¹

These traditions did not form a continuous narration like an epic; every anecdote stood by itself and spoke of a single event. In the Bible they have been grouped into a continuous narration, but each event can be read separately. It is improbable that any such anecdotes were committed to writing in pre-Islamic Arabia.³² They were, however, known to the Arab historians of the Muslim period. They did not find their way into the Muslim historical literature before the seventh/thirteenth century, because the earlier historians were doubtful of their historical worth. They were valuable for philological studies, but not as sources of history, because they partook of fiction, being generally one-sided and meant to glorify one side.

Besides, they were not intended to be sober history; indeed, their original purpose was not the preservation of any historical fact, the conception of which was unknown to the pre-Islamic Arabs, but to be sources for entertainment for the listeners when recited. They were, however, significant in one sense: they created a tradition of recording a single event.

The narration of single events and their reporting is capable of independent and impartial treatment, and thus provides us with the raw material of history. These events can be strung together either chronologically or on the basis of a period, a locality, or even a topic. The treatment, however, tends to differ from continuous narration, because every report is a unit in itself. The line is not easy to draw and yet it is not difficult to see where the emphasis upon individual events is, even though they may be connected. This form of historiography came into vogue among the Muslims fairly early and is referred to by the name of akhbar. In its singular form, khabar, the word means a report, an item of news. In the oldest form of Muslim historiography one comes across small pamphlets written to describe a single event, like the pre-Islamic narra-tion of single battles.

The simple narration soon gave place to the description of the event followed by a discussion of the causes which were responsible for its happening. Even though such a description related to only a single event, it came closer to the present method of discussing the genesis of a happening. The single khabar gave place gradually to akhbar, a collection of several or many khabars. Theoretically, this could be quite disconnected, but the events or anecdotes came to have a focal point regarding a place or a subject and in their arrangement showed a consciousness of chronological sequence. Even in this form the method had serious handicaps.

A khabar was a well-rounded narrative, but the continuity of a historical process is difficult to convey in this manner. Any deep interpretation of facts also is ruled out, because the tendency is to look upon life as a series of separate incidents without much anxiety to discover their interaction. Every khabar was told like a vivid short story, hence it tended to sacrifice clarity and factual-ism for the creation of effect. This was sometimes achieved by the insertion of a few verses to drive a point home or to give it a dramatic quality. Indeed, it was not uncommon for the historian to retreat into the background and let the chief characters speak for themselves, very much like a dramatic dialogue.

In this form the facts were lost in the midst of the emotions of the speakers, who, to ring true, had to be shown saying what, in the opinion of the historian, they would have felt in the circumstances. Being the earliest form of historiography among the Arabs, the khabar was naturally integrated into other forms and was rarely found in its original and pure shape. It occurs in other works as well and can be spotted by its vivid style and the insertion of faked or actual conversations.³³

Its most developed form was the mono-graph on some single historical event. A well-known historian in this style was 'Ali bin al-Mada'ini (752-830/1351-1417), known only through quotations from his works in other histories. A list of the books written by him is pre-served in al-Fihrist. In the sub-continent of India and Pakistan, perhaps Amir Khusran's Khaza'in al-Futuh furnishes the best example. His Tughluq--namah, though written in verse, which is not usual with Khabar histories, has many of their characteristics.

It would, however, be a mistake to think of all books written on single reigns as falling into the category of the khabar literature. Its beginnings

were, as has been mentioned, religious because it developed out of the desire to collect all the information about the life of the Prophet. The biographies of the narrators of hadith were a by-product. The biographies of religious and political persons followed naturally. Some biographies were written for sec-tarian purposes, for instance, the earlier works on the descendants and sons of the Caliph 'Ali; several biographies of Husain, Zaid bin 'Ali, and others fall in this category. Sometimes biographies were written at the request of a noble or a monarch.

Thabit bin Qurrah wrote a biography of al-Mu'tadid, which was completed by his son Sinan; this was supervised by the patron himself. Shams-i Siraj 'Afif's Tarikh-i Firuzshahi is a typical biography of a monarch; the Sirat-i Firuzshahi partakes of memoirs because it was super-vised by the monarch. Sometimes the biography of a patron was also a record of the author's own times and it is not always easy to draw the line between biography and memoirs. An excellent example is the Nawadir al-Sultaniyyah w-al-Mahasin al- Yusufiyyah, being the biography of Sultan Salak al-Din by ibn Shaddad. It achieves a high standard in depicting the character of the great monarch. Abu al-Fadl's Akbarnameh can be looked upon as a highly successful biography of a remarkable man in spite of the author's obvious endeavor to paint the monarch in as favorable a light as possible.

The success of the book lies in a faithful record of the events of the reign, which find confirmation in other authorities as well. The character of the monarch stands out clearly and in spite of the profusion of the adjectives in praise of Akbar, the panegyrics can be separated quite easily from what is the sub-stance of the narration, because these are introduced as much to deliver formal homilies of praise as to show off the capacity of the author as a master of ornate style. They are not spun into the texture of the narrative in a manner to confuse the reader.

A biography sometimes includes accounts of some of the ancestors of the sub-ject, but their lives occupy a minor place in the book and are introduced more often to trace the exalted line of descent of the main character. Sometimes, how-ever, the biography is extended to include others. In this category would fall the histories of dynasties or families. There are good examples of dynastic histories; the Tarikh al-f~hazdni by Fadl Allah Raid al-Din (d. 718/1318) being a history of Chingiz Khan and his family³⁴ may be cited as one.

Another form of the collected biographies was the tadhkirah. Some of the tadhkirahs dealt with poets, others with Sufis, yet others with scholars, but they all had the common characteristic of being collections of short biographies of a number of persons. As a matter of fact, like other forms of biography, they differed considerably not only in their subject-matter, but also in the standards achieved. The tadhkirahs of poets always incorporated some critical material; the best of these were highly instructive as essays in literary criticism. The tadhkirahs of the Sufis were extremely popular, partly because of the growing popularity of the Sufi silsilahs and the great esteem in which some of the saintly Sufis were held by the populace, and also

because of the Muslim tradi-tion of teaching religious truths through the biographies of learned and pious personages.³⁵

This was based on the fundamental Muslim thinking that the best way of understanding Islam was through the study of the life of the Prophet. It was for this reason that biographies of jurists and scholars also were not neglected. Apart from monographs on biographies, it became the fashion to include sections on the biographies of important people in general histories.³⁶ These would include the lives of theologians, Sufis, physicians, poets, and nobles. The disciples of famous Sufis sometimes collected their sayings into *maljuzat*; these consisted of the more significant utterances of the shaikh with a record of the circumstances in which they were made.³⁷

In a way this may be considered to be a form of the *kabar* literature; it is, however, different in spirit, because the intention here is not to entertain but to instruct. Some *tadhkirahs* of the Sufis suffer from the admixture of supernatural fictions with truth. The defect is generally found in books written long after the subject of the *tadhkirah* had died and legends had grown about his super-natural powers. The writers of the *tadhkirahs* were seldom guilty of deliber-ately inventing tales; they only uncritically incorporated what they had heard. The *tadhkirahs* are very valuable because they generally give a picture of the social conditions of an age in which the general histories seldom devoted sufficient space to non-political topics.

The chronological order of the development of Muslim historiography has been transgressed in tracing the growth of the *khabar* form of historiography. Long before some of the developments narrated above, there had grown the annalistic form, in which the events were grouped around years. The historian took up the years in succession and then narrated the important happenings of each year. This was an excellent device for fixing the chronological sequence of events; and in all probability it gave to history the name of *tarikh*. It has been mentioned above that the word *tarikh* seems to have come into use in the pre-Islamic Yaman in the sense of fixing a deed in time; in other words, giving a date to a transaction. The earliest Islamic use is in connection with the establishment of the era of the Hijrah.³⁸

Thus, apart from the narration pure and simple, which was *khabar*, *tarikh* was properly the assigning of a date to an event and, conversely, the fixing of an event in time by giving it a definite date. The annalistic form, therefore, seems to have played an important role in giving the name of *tarikh* to history. The greatest name in this form of history is the well-known Abu Ja'far al--Tabari, whose famous history was written in the early fourth/tenth century. This is the first history in the annalistic form written by a Muslim that has come down to us. Tabari's greatness is recognized now in all quarters because of his accuracy and great diligence in collecting data and giving them the form of authentic history by sifting evidence, which he must have done to achieve the result.

There are indications that others may have preceded him in using this form; indeed one 'Umarah bin Wathimah has been mentioned to have written a history in the annalistic form in the third/ninth century, but we know very little about the book.³⁹ It is, however, reasonable to believe that Tabari was not the first to use the form, but he is undoubtedly the greatest

among those who have used this method both before and after him. The tradition, however, was continued and 'Ali bin Yusuf al-Qifti has mentioned a succession of trustworthy authors beginning with Tabari and ending with the year 616/1219.⁴⁰ The best example in the Indo-Pakistan sub-continent is the *Tarikh-i Alfi* composed by a commission appointed by Akbar.

The annalistic form had serious limitations; for this reason it was not imitated on a large scale. It made an absolutely reliable chronology indispensable but where dates could not be determined with absolute certainty it was useless. Besides, this treatment tends to become merely a catalogue of facts in the hands of an unimaginative historian. Even at its best, it leaves little scope for philosophical synthesis or analysis. Even the inclusion of cultural and administrative data becomes difficult; the tracing of the growth of cultural, social, and administrative institutions is ruled out. The understanding of social or even political processes is not aided by this form of history.

When this form was combined with the idea that the highest expression of objectivity lay in a bare statement of the naked fact unadorned by any illuminating comment or opinion, it became little better than a chronology in tabular form that many historians found useful to append to their works. The sub-sequent arrangement of information in decades, generations (*qarun*), or centuries, may have been derived from annalistic historiography. In any case, the grouping of biographical information in accordance with periods of time seems to have been affected as much by annalist traditions as by other considerations like the convenience of grouping people together by the years of their death.

An outgrowth of these forms was the genre of *tabaqat*. A *tabaqah* means a layer; it generally refers to a generation. The word *Barn* meaning a generation preceded the word (*tabaqah*, but later (*tabaqah* came to be used more often until works were called by the names of *tabaqah*. The term was originally applied to different generations of the narrators of Hadith; then it began to be applied more loosely, until it embraced the succeeding generations of all kinds of men. A history which was named by its author as *tabaqat* was meant to give information about various classes of people; however, the author seldom used the term in this wide sense and, therefore, only the classes that mattered in the opinion of the author were included.

Quite often a *tabaqat* work could limit itself to a single reign. Some of these are more like *tadhkirahs*, as, for example, *ibn abi Usaibi'ah's* history of physicians or *abu Ishaq al--Shirazi's* history of the jurists. *Tadhkirahs* and *tabaqat* of this nature alike gradually adopted an alphabetical arrangement to make reference easy, so that some of them came to be biographical dictionaries, often concise and limited to the barest facts. There were notable exceptions and, as has been mentioned earlier, many books dealing with poets incorporated critical reviews of their main works.

The Muslim historians developed many useful mechanical techniques. They were not averse to putting statistical and other factual information in the form of tables.⁴¹ They appended in many places their authority for a statement.⁴² Indeed, with the more careful historians, the sources of their information are almost invariably revealed. They attached bibliographies to

their works, utilized official documents and correspondence, and when they thought that it was necessary to do so, they quoted the document verbatim. Consequently, some important documents have thus been preserved for us.⁴³ They utilized all official material that was available to them including the more important decisions of the courts. The Muslim governments kept good records; the courts also had records of all the cases that came before them. The historians, therefore, had no dearth of official material and they used it whenever they found it relevant to their subject. They were aware of the importance of numismatic and epigraphical evidence and used both frequently.

It has been mentioned that the Muslims look upon themselves as a world community. Muhammad as a successor to all the prophets of the world came to fulfil the missions of all of them. The history of the world was, therefore, a matter of vital concern to the Muslims. A fairly large number of histories were, therefore, planned as world histories. The knowledge about the history of the non-Muslim world was fragmentary and depended upon the accuracy of the local tradition which was not reliable in most instances.

There were large regions which had no history; it is, therefore, obvious that the Muslim histories could not be perfect in the recording of the events of other regions or of the past of the regions where Islam had domination. The science of archaeology had not been developed; the methods of deciphering dead languages had not been invented. Because of these factors some non-Muslim pretenders to knowledge practiced curious frauds upon Muslim rulers and Muslim scholars.⁴⁴ History based on traditions and legends cannot be satisfactory; hence we find that the Muslim accounts of the ancient history of Mesopotamia or of Egypt are unreliable and fragmentary. The knowledge of the Arabs grew as their geographers succeeded in accumulating knowledge. Yaqut bin 'Abd Allah al-Hamawi's geographical dictionary, *Mu'jam al-Buldan*, seldom fails to incorporate biographical material of the people of note belonging to a locality. 'Ali ibn al-Husain al-Masudi is the best example of the interaction of geographical and historical knowledge; indeed, he combines the two disciplines in a remarkable manner. Today the works of the Arab geographers form a good source of history and are indispensable; even to their contemporary historians they were of extreme importance.

So far as the world of Islam was concerned, it was a real entity. In the earlier period before the rise of the 'Abbasids split the Muslim world into the East and the West, it formed a single polity. Juristically and theologically, the indivisibility of the Muslim world is an axiom, based as it is upon the Qur'anic doctrine of the brotherhood of all Muslims and upon the implied universalism in the conception of the unity of the Muslim community. It is, therefore, a matter of no surprise that it seemed only natural to the Muslim historians that they should look upon the whole of Muslim history as a single entity. Some of the works, thus, became huge compendiums because they had to treat the various regions and States which in spite of the theory came to have separate histories. With the weakening of the 'Abbasid Caliphate, it remained no easy matter to treat the entire Muslim world in one work. The most outstanding work that achieved great success in this respect

is ibn Athir's *Kamil fi al-Tarikh*. It maintains its balance despite the length of the period which it covers and the large number of countries that it deals with. Despite its annalistic arrangement, it is not devoid of philosophical reflections on the happenings of some importance.

However, this trend of writing universal histories could not last long. For one thing, the distances were enormous and it was not easy to keep an eye on the happenings of so many corners of the Muslim world. Ibn Air himself complains; "A man sitting in Mosul cannot but miss some events happening in the remote corners of the East and the West."⁴⁵ It must be remembered that ibn Athir was more successful than anyone else. Broken into numerous independent States, even though most of these continued to owe allegiance to nominal Caliphs, the Muslim world could not, despite the doctrine of the unity of the Muslim world, ignore its division. It entered the domain of religious thinking as well and there grew up proponents of legally sovereign States, every monarch exercising the functions of the Caliphate within his own dominions and enjoying the prestige of being the Caliph in his territories. The Moghul Emperors of the Indo-Pakistan sub-continent were an outstanding but not the only example of the dynasties that accepted this theory of divided Caliphate. Even before, there had been written dynastic and local histories, but gradually the new trends brought to an end the tradition of universal histories of the Muslim world. The intermediate stage was that of the historian who would begin with the beginnings of the Islamic history and then trace the developments in the area about which he was writing, thinking that the Islamic traditions in his own land were a continuation of the history of Islam. Abu 'Umar Minhaj al-Din 'Uthman bin Siraj al-Din al-Juzjani's *Tabaqati-i Nasiri* is a good example. The dynastic and local histories have already been discussed.

The connection between political science and history was generally understood by the historians. As a matter of fact, the knowledge of history was considered essential to the work of statecraft. The policies pursued by previous monarchs were put forward as object lessons to illustrate the consequences of foolish as well as wise methods. For this reason many authors included a good deal of information about administrative measures in their books and summed up their success or failure. In the sub-continent of India and Pakistan a considerable amount of space was devoted to the administrative reforms undertaken by the rulers. Diya' al-Din Barani's *Tarikh-i Firuzshahi*; Shams-i Siraj 'Afif's *Tarikh-i Firuzshahi*, the *Sirat-i Firuzshahi*, and the *Futu-hat-i Firuzshahi*. Abd al-Qadir Badayuni's *Muntakhabat al- Tawarikh*; Abd al--Hamid Lahori's *Padishahnameh*; 'Ali Muhammad Khan's *Mir'at-i Ahmadi*, to name but a few, are replete with this kind of information.

The most out-standing work, however, is abu al-Fadl's *Akbarnameh*, of which the *A'in-i Akbari* is intended to be an appendix. But what an appendix it is! It is a virtual gazette of the Moghul Empire and contains so much economic and administrative data that scholars have not yet been able to utilize them fully. The administrative institutions, the policies of the State, the divisions of the population, the agricultural produce of the various areas, the crafts and industries in the different parts of the Empire, and a host of

other matters have been recorded. In addition, a considerable amount of cultural material is included. Compared to al-Biruni's *Kitab al-Hind*, there is no medieval book that gives such a sympathetic account of the Hindu faith and philosophy.

The incorporation of the accounts of alien faiths and cultures is an old Muslim tradition of Muslim historiography. The great geographers seldom mentioned an area without giving some account of the religious beliefs and social customs of its inhabitants. For the non-Muslim times, whenever, for want of historical information of a political nature, the Muslim historian felt at a loss to collect much data, he fell back upon the knowledge of the culture of the people.⁴⁷ The histories quite often incorporate large sections of the biographies of men noted in some fields of culture.

Abu al-Fadl's data are mainly based upon al-Biruni so far as Hinduism is concerned, but his book also contains his own observations and research. In view of the immediate sources of knowledge available to him and because of his voracious thirst for knowledge, it is unlikely that he did not check all that al-Biruni had said, especially when the Emperor himself was taking so great an interest in Hinduism and abu al-Fadl was his constant consultant. The fact that abu al-Fadl had so little reason to differ shows how well al-Biruni had dealt with the subject.

The fact that history had a deep relationship with statecraft was recognized by the monarch's themselves.⁴⁸ The Caliph Mu'awiyah is reported to have spent some time regularly every night in the study of history; the narrator of this story gives details that show that the Caliph devoted this time to the study of mundane and secular history.⁴⁹ These examples can be multiplied ad infinitum. Harun al-Rashid, the Moghul Emperors of India, the Iranian rulers, indeed, monarchs of practically every part of the Muslim world and in every age attached the greatest importance to the study of history. Gradually, a literature grew up that emphasized only those aspects of history that had some direct relevance to statecraft. Sadid al-Din Muham-mad al-'Aufi's *Jawami' al-Hikayat wa Lawami' al-Riwayat* contains selections of historical stories and information that illustrate some principles of politics or administration.

This kind of literature gave place to treatises on administrative matters pure and simple and on politics and statecraft. Even the latter were replete with historical anecdotes. Some were written by men of administrative experience like 'Unsur al-Ma'ali Kaika'us bin Sikandar bin Qabus' Qabusnameh or Nizam al-Mulk Tfsi's *Siyasatnameh*; others were written by professional historians like Diya' al-Din Barani-*Fatawa-i Jahdandari*; yet others by saintly Sufis who were interested in securing the welfare of the people through the instruction of monarchs. In this last category falls the *Dhakhirat al-Muluk* by Sayyid 'Ali bin Shihab Hamadani. The great Ghazali also has a treatise of this nature in his *Nasa'ih al-Muluk*. Some were written by obscure writers and to give importance to their works, they ascribed them to well-known historical characters, as the *Tauqi'at-i Kisra* is ascribed to Nushirwan and the *Wasaya-i Nizam al-Mulk* to the statesman whose name it bears.

History today is related to sociology and endeavors to find the relation-ship between economic, social, and political factors and course of events. Indeed, history is no longer a mere recording of facts; it seeks to understand the significance of these facts as agents in fashioning the social and political fabric; it explores the impact of the past on the present in a more vital and deeper sense. It would be idle to expect the developments of the fourteenth/twentieth century in classical Muslim historiography because a good many of the sciences that are so important in understanding the full significance of historical processes had not developed until recently. For instance, the science of economics has made such rapid strides that it can hardly be recognized to be in the least related to the medieval economic thinking.

Economic relations were neither so widespread nor were they so complex in a world where rapid means of transport were not known and the impact of world forces was not felt so quickly as in the world of today. Yet the Muslim historians were not unaware of these considerations. It is a truism to repeat that ibn Khaldin's contribution in connecting history with sociology has been outstanding. He has been highly praised by modern authors and he has richly deserved this praise. "In the Prolegomena (Muqaddimah) to his Universal History (Kitab al-'Ibar) he has conceived and formulated a philosophy of history which is undoubtedly the greatest work of its kind that has ever been created by any mind in any time or place."⁵⁰ "Ibn Khaldin was a historian, politician, sociologist, economist, a deep student of human affairs, anxious to analyze the past of mankind in order to understand its present and future."⁵¹

Ibn Khaldin (732-808/1332-1406), considered simply as an historian, had superiors even among Arabic authors, but as a theorist on history he had no equal in any age or country until Vico appeared, more than three hundred years later."⁵² So far as ibn Khaldin's own position and contribution are concerned, it would suffice here to give these quotations, because a fuller discussion of his work is given in Chapters XLVI and XLIX of this work. It is true that ibn Khaldin had no peers in the world of Islam, but it is not correct as has become fashionable to assert that he had neither predecessors nor successors in what he set himself to do.

Muslim historians do, in their search for causes, go into fields that are not merely political and search out causes that are not discernible on the surface. The Muslim writers had tried to understand the working of economic laws and were conversant with the Greek works on the subject.⁵³ The writers on revenue in particular brought in economics and sound finance within the scope of their work.⁵⁴ Of these perhaps Qudamah bin Ja'far deserves special mention, who in one of his chapters presents a systematic discussion of political and social sciences.⁵⁵ He enters into fundamental considerations regarding the social and economic needs of human beings and the steps taken to meet them. Observations on political, economic, and social factors are found scattered throughout the books of ethics, politics, and history.

In the Indo--Pakistan sub-continent, abu al-Fall among others has brought in questions of economics and social organization while commenting upon administrative measures. The most outstanding example

is Shah Wall Allah, who based his philosophy on economic and social foundations.⁵⁶

Being confronted with the problem of the decline of the Muslim political power in the sub-continent of India and Pakistan, he analysed the forces at work to diagnose the disease from which the polity as well as the society suffered at that time and came out with his suggestions for curing their ills, in doing which he explored a wide range of economics, sociology, history, and politics. He examined the relations subsisting between the producers and consumers and laid down the dictum that in a balanced society everyone must contribute to its welfare. Then he pointed out how some sections of the society had become parasites and, thus, had upset the balance. This kind of analysis runs right through his discussions, whether he is discussing social conditions or examining political and economic ills. He has a historical mind because he brings in the examples of the great civilizations that had preceded Islam and draws relevant conclusions from their fate.

In conclusion one may say that history has been a favorite discipline with the Muslims. They brought the highest standards of objectivity into their writings; they showed great enthusiasm for the discovery of true facts; they produced a vast literature of considerable merit at a time when even among the civilized peoples there was not much flair for historiography; indeed, there were cultures of a highly developed nature that had no place

Jurisprudence in their learning for historiography. At such a time the Muslims established standards which have not always been improved upon in the modern world. For instance, contemporary nations have to learn a good deal in standards of objectivity and in distinguishing between national glorification and history. The Muslims were able to expand the scope of history from mere recording of facts into a repository of political, administrative, and cultural experiences and made fruitful essays into the analytical field as well. They failed like the political thinkers of Islam in suggesting the evolution of institutions that would have enabled greater and more responsible participation of the people in the affairs of the State, but they did help in making the Islamic governments beneficent and benevolent at a time when other governments tended to be arbitrary and even tyrannical.

4. Rosenthal, *op. cit.*, p. 66, n. 5.

5. The main argument in favor of Byzantine influence is that some historical works written before the known Muslim histories show a similarity in arrangement. The annalistic arrangement, thus, could have been taken over from the Byzantines. On the other hand, the annalistic form could be a natural development. The argument against the acceptance of the view that the Byzantines had any influence is that the Muslim historians do not mention Byzantine authors, in spite of the fact that they were fond of mentioning their sources of information.

6. The work that has come down through an Arabic translation is *Khuatainamak*, which can hardly be called a history. Other sources of Iranian history were translated into Arabic towards the second quarter of the eighth century A.D. None of these was considered important enough to be preserved in spite of the Iranian tendency to glorify their past. *Firdausi's dhah Ndmeh* written in the fourth/tenth century depended upon legend rather than history. If there had been any sober history available at that time, more of it would have entered the poem.

7. This is inherent in the Muslim belief, based upon the Qur'an, v, 48; vii, 30, etc.

8. *Ibid.* v; 68ff etc.

9. *Ibid.* xxxii, 40, where the Prophet has been called "the seal of the prophets." The seal comes at the end of an epistle. There is also a hadith which says, "There shall be no prophet after me."

10. Qur'an, e.g., vi, 6; x, 70ff.; xi, 25ff.; xix, 74; xxix, 20ff.; xxx, 9, 42-47; xxxv, 44, 45, etc., etc.

11. *Ibid.*, iii, 104

12. *Ibid.* iii, 110.

13. *Ibid.*, xi, 100

14. 14 *Ibid.* VI, 25; viii, 31; xvi, 24, etc., etc.

The Qur'an uses the word "aadtir" which has generally been considered to mean stories, because of its resemblance to the Greek word *historia* (Golius, *Lexicon Arabico-Latinum*, Leiden, 1653, column 1171), but this seems to have little sub: stance in fact, except for the coincidental resemblance. Several European authors have followed Golius, but opinion has now changed. Indeed, the Arabs should have been the first to notice the resemblance and to use the word in the sense of history if there were any substance in this identification. It is more likely that the word has been derived from *satar* (to write); hence *asdtir* should mean a record. They certainly do not seem to imply that the Prophet was reciting to them merely fables.

15. This is obvious from the references to communities like 'Ad, Thamnd, etc., vide note 10; also Qur'an, xiii, 30; xiv, 36.

16. Many religious thinkers in Islam refer to the Jewish legends adopted by some *mufassirin* as *Isra'iliyat* and disapprove of their use.

17. Muhammad bin 'Abd al-Rahman al-Sakhawi, *al-Flan bi al-Taubik li man Mamma AN at-Tarikh*, translated into English by Rosenthal, op. cit., pp. 246, 247, 263.
18. 18 Muhanunad bin Sulaiman al-Kafiyaji, *al-Mukhtarar T 'Itm al-Tdrik_h*, selected passages translated into English by Rosenthal, op. cit., pp. 189, 190; al-Sakhawi, op. cit., pp. 205ff.
19. Qur'an, VI, 116; the corruption of previous Scriptures finds mention also at other places, e.g., v, 13.
20. Al-Sakhawi, op. cit., pp. 259, 261.
21. Ibid., p. 299.
22. Ibid., p. 264.
23. Al-Khatib al-Baghdadi, *Kifayah*, Hyderabad, 1357/1938, pp. 39ff.; also, al-Bukhari, *Sahih*, iv, 121, 126, 142 (Krehl).
24. E.g. *Diya' al-Din Barani*, *Tarikh-i Fireczshahi*, Calcutta, 1860-62, pp. 16, 17.
25. Jalal al-Din Muhammad Akbar (1556-1605), third in the line of succession among the Moghul Emperors of India.
26. His subtle insinuations have, through faulty translation, caused grave mis-understandings among European writers like Vincent Smith.
27. E.g. passages quoted in *Sources of Indian Tradition*, ed. William Theodore de Bary, Columbia University Press, New York, pp. 527, 528, show quite clearly that the authors do not intend the readers to take all their adjectives seriously. Akbar was certainly not "the ruler of the world and of all who inhabit it" nor the "origin of the canons of world-government" and "author of universal conquest."
28. E.g. passages quoted in *Sources of Indian Tradition*, ed. William Theodore de Bary, Columbia University Press, New York, pp. 527, 528, show quite clearly that the authors do not intend the readers to take all their adjectives seriously. Akbar was certainly not "the ruler of the world and of all who inhabit it" nor the "origin of the canons of world-government" and "author of universal conquest."
29. O. Lofgren, *Arabische Texte zur Kenntnis der Stadt Aden im Mittelalter*, Ljpsala, 1936, II, pp. 20, 43-47.
30. Barani, op. cit., pp. 16, 17.
31. "Exodus," xiv, 30; "Samuel," I, xvii.
32. Some scholars are of the opinion that no written prose literature existed in pre-Islamic Arabia, e.g., William Marçais, "Les Origins de la prose litteraire arabe," *Revue Africaine*, LXVIII, 1929, pp. 15-18.
33. A good example is Sultan 'Ala' al-Din Khalji's conversation with Qadi Mughith, reported by Barani, op. cit., pp. 293-97.
34. Many of the histories written in the Indo-Pakistan sub-continent do not fall into the category of dynastic histories. They generally take up certain periods of Muslim rule or of a dynasty, but few works are devoted entirely to a dynasty.
35. E.g., Sheftah's *Gulshan-i Be-khar*, Azad's *Ab-i Hayat*, and Shibli's *in-i r at-'Ajam*
36. E.g., Badayuni in his *Muntakhab al-Tawarikh*, Abu al-Fadl in his *A'in-i Akbari*, etc.
37. E.g., Hasan'Ali Sajzi's *Fawa'id at-Fuwad*.
38. Al-Sakhawi, op. cit., p. 310; al-Kafiyaji, op. cit., p. 183.
39. 'Abd al-Rahman bin 'Ali al-Jauzi, *Muntazam*, Hyderabad, 1357-58/1938-39, p. 37.
40. 'Ali bin Y6sufal-Qifçi, *Tarik_hat-Hukama'*, ed. A.Muller and J. Lippert, Leipzig, pp. 110ff.
41. *A'in-i Akbari* abounds in such tables; Barani gives tables of the names of officers in each reign, etc.
42. This was derived from the way ahadith were narrated: "A heard from B who heard from C who heard from D that the Prophet said....."
43. Some examples are: Baihaqi in *Tarikh-i Baihaqi* has preserved the oath of allegiance taken by Mas'ud of Ghaznin to the Caliph; Badayani has preserved the text of the mahdar recognizing Akbar's authority to choose an interpretation where the doctors of law disagreed; abu al-Fadl has preserved the letter Akbar wrote to 'Abd Allah Khan Uzbek of Transoxiana, etc.

44. When Asoka's pillar was brought by Firuz Shah from Meerut and erected at Delhi, the Hindu pundits who do not seem to have known Pali said that the inscription on it prophesied the great success of Firuz hah as a ruler; also cf. Rosen-thal, op. cit., p. 111.
45. Ibn Aqir, Kamil f al.Tarikh, Cairo, 1301/1883, I, p. 3.
46. This was the reason why historical studies formed an essential part of a prince's education, e.g., Sinan bin Thabit bin Qurrah quoted by ibn al-'Adam, Bughyat al-Talab, Cairo, MS. Tarikh, 1566, I, p. 137; ibn Hamdun, Tadhkirah, Bodleian MS. (Ar.) Marsh 316 part 3, 80b, etc., etc.
47. The reason has been given by al-Tha'libi, Qhurar, Paris, MS. (Ar.) 1488, f. 247a, where he says, "The narration of these matters is like reporting about their kings, because people follow the religion of their kings, especially the Indians who immolate themselves for the glory of their kings and some of them even wor-ship their kings." The author has explained earlier that historical data regarding India are difficult to obtain.
48. Ibn Hamdun, op. cit., says, "Genealogy, history, and elements of jurisprudence, are royal sciences." Compare Yaqut, Irshad, Cairo, I, p. 27, who says, "the know-ledge of genealogy and history belong to the sciences of kings" bah Jahan made a habit of listening to history every evening ('Abd al-Hamid Lahori, Padishah-nameh, Bib. Indic&, Calcutta, I, p. 153).
49. Al-Mas'udi, Murdj al-Dhahab, Cairo, 1346/1927, II, p. 72.
50. Charles Issawi, An Arab Philosophy of History, London, 1950, p. x, quoting Arnold J. Toynbee.
51. Idem, pp. x, xi, quoting George Sarton.
52. Ibid. p. xi, quoting Robert Flint.
53. M. Plessner, Der ouxovuir.6S des Neupythagoreers "Bryson" and sein Einfluss auf die islamische Wissenschaft, Heidelberg, 1928, Orient and Antike, Vol. V.
54. The various books on Kharaj and the A'in-i Akbari of abu al-Fadl are good examples.
55. Rosenthal, op. cit., pp. 462-63, gives a table of contents.
56. Such material is found in several of his books, especially Hujjat Allah al. Balighah; an Urdu translation is available, Lahore, 1953.

Chapter 61: Jurisprudence

In this chapter it is proposed to bring into relief the philosophical significance of certain salient points and aspects of Muslim Law, otherwise known as Fiqh. But before doing so, let us have a tolerably precise idea of what one understands by law, and in particular what the Muslim jurists have understood by it.

A - The Law

Law roughly means the rules of conduct. But not every rule of conduct forms a part of law. There are things people instinctively do under the dictates of their normal impulses. These do not concern law, nor are the concern of law the modes of behavior regarding things which persons do deliberately but which relate to their private lives, and have no repercussions on other members of the society or are of rare occurrence. Men differ enormously among themselves in their capacity for reasoning and the power of choosing an action out of the various possible alternatives. Even some matters of general occurrence and those affecting other persons besides the agent himself do not come under law. Law does not take cognizance of the behavior of individuals which is infinitely varied, for if it did, it would lead to chaos and conflicts rather than uniformity in behavior.

The cases which fall under law are as follows:

(i) Sometimes certain individuals do things of their own accord and thus their private initiative sets precedents, customs, and usages if experience shows their utility, or in case historical reasons create a halo of prestige and awe around the names of their initiators.

(ii) Sometimes actions are done at the instance of others. For example, a child may do something or abstain from doing something because its mother, father, or some other superior directs it to do so. A young student may behave similarly at the instruction given by his teacher. A grown-up man may do something at the suggestion of his friends in whose sincerity and intelligence he has confidence, on the direction of his spiritual guide, or at the dictates of public opinion. Rules of conduct are also sometimes determined by the orders of a superior to whom we delegate powers out of our own free choice, such as an elected or accepted ruler with or without the power of revoking our decisions. On other occasions a rule of conduct may arise from a superior's order, obedience to which is a lesser evil than its disobedience. Such is the case with prisoners of war, slaves, and the like who must abide by the order of their master under pain of coercion and punishment.

(iii) A rule of conduct may also be considered to be of divine origin. Our forefathers in different parts of the world at various epochs have continuously believed certain individuals possessed of lofty character to be messengers of God and later generations have inherited this belief. It goes without saying that of all the superiors' orders those that proceed from God must remain the most meritorious to obey. God's orders, according to religious beliefs, are received through the agency of certain human beings chosen by Him and called by some prophets and incarnations of God by others. The commandments communicated by such persons are accepted by

those who believe them to be the orders of God, the Creator and Master who will judge them all on the Day of Resurrection according to their deeds.

(iv) Lastly, there are deductions from and interpretations of basic laws, such as lead to new laws.

Muslim Law is a collection of all the four types of rules mentioned above, viz., rules of customs, orders of superiors, divinely revealed Laws, and the rules arising from the deliberations of jurists. There is the Qur'an, which is taken as the uncreated Word of God; there is the Hadith and Sunnah (sayings and doings of the Prophet of Islam) which include not only what the Prophet said or did himself, but also what he tolerated of the existing practices among his Companions, practices coming indeed from pre-Islamic habits and customs. Moreover, there are individual or unanimous opinions of experts and special-ists (jurists), there are customs which do not go against express laws, and there are foreign laws acted upon on the basis of treaties, reciprocity, and so on and so forth.

Whether the legislators of Islam abolished some old customs and practices, retained and confirmed some others, intact or in a modified form, or took the initiative of ordaining new rules of conduct-the sole principle that guided their legislative activity in all these cases was to "do what is good, and abstain from doing what is evil." According to al- Ghazali¹, this principle of good and evil (husn wa qubh) was propounded by the Mu'tazilite jurists. Being more rationalist than their contemporary traditionists, it was the Mu'tazilites who were perhaps the first to be struck by the curious and repeated stress which the Qur'an has laid on the rational side of life. To persuade men to abide by the precepts of Islam, the Qur'an again and again appeals to reason (tadabbarun, tatajakkarun, ta'qilun, etc.), and repeatedly refers to ma'ruf and munkar² as the bases of Muslim Law.

Now, ma'ruf means a good which is recognized as such on all hands, and a munkar is an evil disapproved as such by everybody. It cannot, therefore, be true that the rules of conduct laid down by the Qur'an and the Sunnah are arbitrary and merely for the purpose of testing the will to submit on the part of the Faithful. Evidently, not every man in the street will be able to understand the underlying principles of each and every Qur'anic order or injunction. That is the domain of the specialists of the philosophy of Law. An anecdote will explain the point. Abu Hanifah, one of the early jurists, had a penetrating mind, and was also endowed with a sense of humor. Not always being able to understand the reasons that led this great jurist to hold certain opinions, stupid people began to accuse him of heresy; according to them, he legislated by his personal opinion in disregard of the sayings or practice of the Holy Prophet. Once somebody had the audacity to tell this to his face.

Abu Hanifah replied: "I never promulgate rules on my personal opinion; on the other hand, I always deduce laws from the sacred texts of the Qur'an and the Hadith. Had I relied on my personal reasoning, I would have ordered that in the act of ablutions, one should pass a wet hand not on the uppers of a shoe (khuff)-as is ordered by the Prophet-but on the sole, for that is the part which requires cleansing more than any other part of the

footwear.” In this humorous way, abu Hanifah succeeded in silencing and even calming the apprehensions of his well-meaning critic.

The answer was humorous, because abu Hanifah did not refer to the reasons for not washing the soles of one's shoes for if the sole of the footwear is moistened and then one stands up for the service of worship, it is the more apt to get dirty if one prays on the ground, and to soil the carpet if one prays on one. In other words, a single issue may have several aspects, but it is the duty of the philo-sopher to give preference to the more important of such aspects.

However, the principle of the Islamic Law is that its rules must be based on the good and prohibitions on the evil inherent in a given act. This was an original contribution of Muslims to the legal science; no other civilization had thought of it before, as has been admitted by Professor Ostrorog in his brilliant essay “Roots of Law,” contained in his book Angora Reform. In fact in expounding the Qur'anic statement, “Do what is ma'ruf (what is good in the eyes of God and man) and abstain from what is munkar (what is evil in the eyes of God and man),” the Muslim philosophers of Law developed an all-embracing system. A brief expose is all that we can take up here in dealing with a subject which fills scores of pages in works on Usul al-Filth (the Prin-ciples of Law).

In this world in which everything is infested with relativity, it is often impossible to obtain unmixed goods, and sometimes it is even possible to say that a given act contains neither good nor evil. Therefore, what seems to be unmixed good will be ordained as an obligatory rule (wajib); what is unmixed evil will be declared as an obligatory prohibition (haram); in complex cases, predominance will decide the preference: a matter of predominant good will be recommended (mustahab), and one of predominant evil discouraged (makruh), without going so far as to declare them obligatory to perform or to abstain from. And in matters where good and evil are equal, or where one is unable to see either good or evil, Law will leave it to the discretion and choice of the individual to act or not to act.

This five-fold division of actions giving rise to five rules of law-order, prohibition, recommendation, discouragement, and indifference-resembles the cardinal directions of the compass. Even as we can subdivide the directions and say North, NE, NNE, and so on, we can also find out intermediary grades between good and evil. The absolute good will be divine order, obligatory on each person in a group (fard'ain) or obligatory on at least a few in the group (fard kifayah); the good with less sure absoluteness will be legal order (wajib), and practice of it will be enjoined with insistence (sunnat mu'akkadah). The act with pronounced inclination towards the good will be recommended or preferred (mandub or mustahab) and the one on the deadline will be superero-gatory (nafl). Similarly, the evil may be prohibited (haram), tending to be prohibited (makruh tahrinai), better to shun (makruh tanzih) and so on.

It is true that the application of these mathematically perfect rules of the legal geometry to concrete cases will be affected as everywhere else by play of the human element, more so in matters of intermediary grades with subtler points to judge. With regard to such matters the judges and jurists

differ among themselves. Abu Hanifah would say that to eat prawns is forbidden, but al-Shafi'i would declare it to be perfectly lawful. Certainly this respective relegation of the prawns as food to what is good or bad is only relatively so, and the forbidden character of their consumption has not the same degree of prohibition as, say, that of wine. Jurists call it deduced prohibition (Haram istinbati) as distinct from legal prohibition (haram shar'i).

Narrow minds may fail to see this point and enter into quarrels. Here a case may be cited which seems to be the model to follow in such cases: abu Hanifah and al-Shafi'i are doubtless two of the leaders (imams) of Muslim Law, completely independent of each other in legal judgment. According to al-Shafi'i, the qunut prayer at dawn (fajr) is obligatory, whereas abu Hanifah suppresses it completely. The story goes that once al-Shafi'i went to Baghdad (where abu Hanifah lies buried), and during his stay there he renounced his own view on the qunut prayer. When questioned, he said: "I continue as firmly to cling to my opinion as before, yet in the presence of the great abu Hanifah I feel ashamed to follow my own opinion." Needless to say that the implication is that such learned differences do not concern the general public who should not only follow their leader (imam) but should also be tolerant of those who are followers of other leaders.

B -Law And Ethics

Islam attaches very great importance to ethical values, yet it makes a distinction between Law and morals. In the books on Filth, one comes across such expressions: "that is the rule of Law (fatwa), though the rule of piety (taqwa) requires just the contrary." The meaning is clear: the jurist wants to say that there is some difference between human justice and divine justice. Far from being impeccably perfect, what is human must fall short of the divine. The jurists consult and the judge decide cases on the basis of facts and evidence produced before them. If certain important facts, with bearings on the nature of the litigation, are concealed from the arbiter-no matter intentionally or otherwise-the decision may be correct de jure but not de facto, the latter being beyond human possibility, at least in some cases. For this very reason, the Holy Prophet once said: "Some of you are better pleaders, and I decide according to facts submitted to me. If I decide in favor of any of you what is not his due, let him know that I award him only a part of the hell-fire with which he will fill his belly,"³ if he profits by such a decision based on mistake or the only available material facts.

The law which claims to be based on the good is often hard to distinguish from ethics. Nevertheless, it may be said that there exists a measure for differentiating between them. For, the rules of Law in Islam have a double sanction, namely, the coercive power of the court of justice (a court may enforce its verdict to get the rightful owner his due, or, in case it is impossible, the court may punish the doer of the injustice), and the divine punishment on the Day of Judgment; but the rules of piety, the ethical rules, as distinct from the legal injunctions have only the other-worldly sanction apart from the more or less effective public opinion.

As Islam inculcates belief in Resurrection and the Day of Judgment, a true believer prefers a loss here to the divine wrath in the hereafter.

C- Sanctions

As we have just observed, the Muslim Law is more fortunate than its counterparts in some other civilizations, for it is endowed not only with the material sanctions enjoined by modern secular States but also with a spiritual sanction, and this in addition to persuasions both material and spiritual. The belief in Resurrection and the Day of Judgment, combined with the mere coercive force of a country's court of justice, assures a greater observance of the law by its believing subjects.

It is common knowledge that the Qur'an repeats scores of times the formula, "Establish service of worship and pay the tax (zakat)," pronouncing prayer and tax in the same breath. Even a beginner in the study of Muslim Law knows that zakat has always been included in the section of liturgical rites ('ibadat) in the manuals of Fiqh. With a word of explanation of the meaning of the term zakat, even the most uninitiated may realize the signi-ficance of this seemingly curious combination of prayer and tax.

Zakat is not almsgiving or charity. Its proper place is in the books on Law. In the time of the Holy Prophet and his successors, the Muslim subjects of the Islamic State-we exclude the non-Muslim subjects for the present paid no tax to the government other than zakat which covered the entire fiscal system. Zakat al-ard was the land revenue; zakat al-tijarah was tax on commercial capital as well as on import customs; zakat al-mashiyyah was im-posed on herds of domesticated animals (ovine and bovine animals and camels) living on public pastures; zakat al-ma'ddin on the sub-soil products; zakat al-'ain was imposed on savings of money, and so on and so forth. Every tax imposed by the government on Muslim subjects was included in the term zakat; this may be corroborated from the sayings of the Prophet on the subject of zakt (as also more or less the equivalent and synonymous term sadaqat).⁴

Now, reverting to the main point, mention of the service of worship and payment of tax in the same breath and, consequently, inclusion of the taxes in the category of liturgical acts ('ibadat) should not astonish us. It is in fact deliberate. In Islam one must do everything for the sake of God. As al-Ghazali has forcefully put it, if you pray or fast for ostentation, it will be a kind of polytheism, the adoration and worship of your own self; on the other hand, if you eat delicious food (with the sole intention of acquiring energy for the performance of acts pleasing to God), and if you cohabit with your wife think-ing that it is the performance of a divinely ordained duty, then these mundane enjoyments constitute real acts of the worship of God ('ibadah). Authors of the works on Muslim jurisprudence (Fiqh) since very early times have affirmed that acts of worship of God can relate both to our body and soul and to our property: if true faith is our spiritual act of worship, and prayer, fasting, and pilgrimage are the physical expressions of the same faith, then zakat is no less than our monetary mode of worshipping God.

A true believer does his spiritual and bodily duties with respect to God, without being forced to them by an organization (such as the government); he also pays his taxes to whomsoever they are due, even when the rightful person ignores his right or finds himself incapable of having it enforced.

Which finance minister of the world would resent that the subjects of the State should believe that paying the government taxes is one of his religious duties, such as would bring eternal salvation in the life to come?

D - Law And Religious Affairs

We have already made passing remarks, in the foregoing paragraphs that the subject-matter of Law consists of the practical affairs of men. It deals with affairs from birth to death, and, to a certain extent, even with those after death (such as the questions of funeral, payment to the creditors, execution of the will, distribution of heritage, remarriage of the widow, etc.).

It will be observed that the Fiqh excludes questions of non-practical nature, such as beliefs and dogmas and, as already pointed out, those of piety and charity, which are questions of conscience rather than those relating to practical affairs properly considered so.

All practical affairs of public nature fall within the purview of Islamic Law because it prescribes for each of them the degree of obligation (fard, wajib, mustahab, sunnah, mubah, etc.). Many a question of politics and ad-ministration too falls under the subject-matter of the legal science, although some latitude obtains in such matters.

It is perhaps useful to point out a certain resemblance that exists between the Roman fas and jus on the one hand, and that between the Islamic Fiqh and Siyasah Shari`ah on the other. In ancient Rome all laws were religious (and called fas) and as such depended on the decisions of the priests; later, the kings arrogated to themselves the right to decide in certain matters (rules of which were called jus) which the priests reluctantly conceded, but slowly more and more matters entered within the competence of jus or civil law of Rome, on which lay authorities could promulgate rules. The Fiqh is also a religious Law, inasmuch as its principal source is the divine revelation, yet the same Law left a number of points, including certain matters of penal law, to the discretion of the ruler and his delegates; this was termed Siyasah Shari'ah. But the nature of relation between Fiqh and Siyasah Shari'ah was such that the latter could not replace the former or encroach upon its privileges. For in Islam the "priestly class" does not exist, at least in the past it was not separate from the class of civil authorities, the Caliph himself being the head at all religious functions.

It is to be pointed out that in other civilizations, human affairs are divided into temporal and spiritual. In Islam the greater part of spiritual affairs is vested in the hands of the same authorities as have the charge of temporal affairs. It seems that the Muslims divide their religious affairs into external and internal. Declaration of faith, service of worship, fasting, and hajj, although closely related to spiritual matters, are yet matters concerning the State, and are, therefore, external affairs. Internal affairs, by which one understands one's relation with God, form the subject-matter of mysticism and are left in the hands of spiritual guides who are also considered successors of the Holy Prophet and, therefore, Caliphs in the spiritual sphere. In this realm, there are no rivalries. Several Caliphs could and did simultaneously exist in the Muslim community. On the death of the Prophet, Abu Bakr and 'Ali could not co-exist as Caliphs for external affairs, yet both

were at the same time regarded as Caliphs of the Prophet in internal or spiritual affairs. As a result of this natural division of functions, Islam has been able to avoid the possibility of a tug of war, and the consequent bloodshed, between a king and the chief spiritual authorities.

It must further be pointed out that the division of spiritual and temporal powers is perfectly lawful in Islam, and does not upset its religio-legal system. The Qur'an⁵ lays down that the practice of former prophets remains valid in Islam, unless expressly abrogated; and it relates, as a precedent, how in the presence of the Prophet Samuel and with his approval the Israelites could accept the famous Talut as king.⁶ The presence of a king and a prophet in the same community necessarily implies the division of powers, temporal affairs falling within the competence of the king. It goes without saying that in Islam the Qur'an is the basis of all rules of conduct, both for the lay authorities and for the religio-spiritual functionaries.

As to the object of Muslim Law, its comprehensive nature admits of no doubt regarding the fact that it aspires the well-being both here and in the hereafter. The Qur'an has condemned those who neglect any of these two, and approves of those who aspire simultaneously after welfare in both.⁷

E - The Chief Sources

The life and longevity of a legal system depends much on its sources; unless these sources are adaptable to changing circumstances, it may not survive for long. Let us see if the recognized sources of Muslim Law satisfy this requirement of longevity. The chief sources of Muslim Law may be classified as under.

Divine Revelation. This is of three kinds: (a) Recited (matluww); (b) non-recited (ghair matluww), i.e., not employed in the service of worship; and (c) a previous revelation. A few details may not be out of place.

(a) The recited revelation as preserved consists solely of the Qur'an, which the Muslims believe to be the Word of God, a collection of divine messages revealed from time to time to the Prophet Muhammad, and preserved from his very time by the double method of writing and learning by heart. If the written document has some error due to inadvertence of the scribe, or even due to an exterior evil such as effacement, damage to the copy, etc., memory comes to rescue. Similarly, if one who has learnt a passage by heart, but while reciting it cannot recall a word, reference can be made to the written document. From the time of the Prophet down to these days, this double method has everywhere in the Muslim world been employed to preserve the integrity and purity of the sacred text, which in this respect is unique in the world.

(b) The non-recited revelation consists of three distinct things: what the Prophet said (Hadith), what he did himself (Sunnah), and what he approved of and tolerated among his Companions such as an ancient pre-Islamic custom consistent with Islamic norms. For lack of a comprehensive term, Hadith and Sunnah have been used as co-extensive, interchangeable, and synonymous terms to cover all the three aspects of the non-recited revelation. It was quite natural for the community receiving a messenger of God to treat every message given and every act done by him as being in conformity with the will and wish of the sender of that messenger, more so

because the Qur'an itself has enjoined that the practice of the Prophet should be treated as the best model to imitate and follow.⁸

The non-recited revelation was both explanatory of and complementary to the recited revelation. As such it helped to clarify the Law and also to interpret it.

A number of the Companions of the Holy Prophet put their memoirs on the subjects of Hadith and Sunnah to writing in the very lifetime of the Prophet. One such compilation, the Sahifah Sadiqah of 'Abd Allah ibn 'Amr ibn al-'As, is reputed to contain one thousand reports.⁹ The case of Anas is much more interesting. In later times, when requested by his pupils, he would bring out a box and show them note-books (majallat) saying, "That is what I wrote from the sayings and doings of the Prophet, and also read to him from time to time, so that if there was any mistake be removed it himself." Many more Companions prepared their memoirs after the death of the Prophet, yet they were all supposed to have been based on first-hand knowledge. Later generations compiled the memoirs of these different authors, always scrupulously mentioning in each case its source. How careful and honest they were may be realized from the following fact.

Al-Bukhari's collection of the Hadith is considered to be one of the most authentic collections. He has cited for each tradition the chain of narrators, i.e., the sources and the sources of the sources up to the Prophet. Supposing he uses the clause: "From ibn Hanbal, who from 'Abd al-Razzaq, who from Ma'mar, who from Hammam, who from Abu Hurairah, who from the Prophet heard. ..," it would be perfectly legitimate for an objective and impartial student to be skeptical and to start fresh investigation by assuming that al-Bukhari has forged the chain of the sources and invented the narration. But we possess also his source, the Musnad of ibn Hanbal, and find that this latter author also cites the same narration, on the basis of the same sources, and gives exactly the same wording of the contents of the narration.

Al-Bukhari is acquitted honorably, but perhaps ibn Hanbal had forged. But no, we possess fortunately also the Musannaf of 'Abd al-Razzaq (now in press in Hyderabad-Deccan, having been edited by Dr. Yusuf al-Din), and there the remaining chain of sources is given and the hadith is recorded in the same words without the least difference. Now say, perhaps 'Abd al-Razzaq was the falsificator. But we possess his source also, for in the Jami' of Ma'mar now being edited by Dr. Fu'ad Sezgin of the University of Istanbul, the same hadith is found, with a shorter chain, but with no difference in the wording of its contents. Perhaps Ma'mar was the forger. But no, his source, the Sahifah of Hammam ibn Munabbih dictated by Abu Hurairah to his pupil, is there to attest his perfect honesty. We also know that Abu Hurairah possessed many books on Hadith. Even in the absence of these books other chains of transmission narrate the same with and attest to its truth and there remains no possibility of its having been falsely attributed to the Holy Prophet.

There is no denying the fact that forgeries in the Hadith have crept in, due to unscrupulous or dishonest authors, yet the double method of riwayat (un-interrupted chain of transmission by reporters known for the integrity of

their character) and of dirayah (scrutiny of the contents and internal evidence) has practically eliminated the chances of forgery in the more important collections, such as the “Six Canonical Collections” (Sihah Sittah). If, how-ever, a certain report seems to us to be incompatible with the dignity of the Prophet as envisaged by our modern conception that alone would not justify our declaring it to be a forgery or a falsification. Many a time the context explains what an isolated phrase does not. A subjective approach must be replaced by an objective one, and everyone should try to understand things with reference to their context-not in isolation-and in the light of the whole system of Islamic Law.

The hadith comprises also the taqir or confirmation of some of the customs and practices of the pre-Islamic days. It shows on the one hand that Islam is a reform of the past and not a complete break with it, nor an entirely new implantation. It also gives an authoritative interpretation of the verses of the Qur'an according to which all that is not expressly forbidden is lawful.¹⁰ The same notion is stressed in two interesting sayings of the Prophet, namely:

(i) “The virtues of the days of ignorance (jahiliyyah) will be acted upon in Islam” (Ibn Hanbal, III, 425).

(ii) “A wise counsel is the lost property of the Faithful (mu'min); wherever he discovers it, he takes hold of it” (al-Tirmidhi, chapter “‘Ilm,” 19; ibn Majah, chapter “Zuhd,” 15).

What is virtuous or vicious in pagan customs is easy to decide by reference to the injunctions and prohibitions expressly given in the Qur'an and the Hadith.

(c) Previous Revelations.-With regard to the earlier prophets the Qur'an has said: “They are those who received God's guidance; follow the guidance they received.”¹¹ But, unfortunately, most of the ancient Scriptures have been lost to us, e.g., that of the Prophet Abraham, of which there is repeated mention in the Qur'an. Some prophets seem never to have transcribed the divine messages they received. The accusation made by the Qur'an of the corruption of the previous Scriptures¹² considerably reduces the importance of this source.

F-Other Sources

(a) Private Expert Opinion.-Law in Islam has a divine origin, yet the exercise of judgment on its interpretation, application, and implications is human. The Qur'an and the Hadith have approved this source, and even encouraged it. Individual opinions are termed qiyas, and the collective ones ijma' (consensus). But the opinions of savants and researchers are not infallible; hence these same savants have approved that a qiyas by one could be rejected by another and a better one suggested. Similarly, an earlier collective opinion can be superseded by a later one.¹³

It goes without saying that a right given by the Qur'an and the Hadith cannot be taken away by any worldly authority.

These private opinions are, however, valid only in so far as they are not against the revealed Law, the principal source. In this connection the Holy Prophet has left a principle for the savants to observe. This principle enjoins that they should aim at facility for the public and not at difficulty. Once he

said: “The Islamic religion is easy. Whoever will render it hard, he will be defeated thereby.”¹⁴ The same principle was repeated in the instructions given to governors: “Provide facility, don't create hardship, and do not frighten people away from Islam.” Hence public weal (istislah) is an additional and valid source of Law.

(b) To the same category should be assigned the rules promulgated by the government-be they based on the ijthad of the ruler, or on expert opinion of the jurists consulted by him-and enforced mostly for administrative purposes. In theory, this may remain in force during the reign of a ruler, until it is abrogated by him or his successor. This kind of legislation is sometimes called al-ahkam al-sultaniyyah. The fundamental principle holds good, viz., that such official directions should not go against the revealed Law.

(c) An allied source is a Muslim ruler's confirmation and retention of pre-Islamic customs of a territory, mostly at the time of the accession of that territory to his State. A typical instance is reported by al-Mas'udi, who says that after the conquest of Iraq and Iran, the Caliph 'Umar retained the Sassanian law of land-revenue. He found it equitable and conforming to social justice. Not so was the case with the Byzantine laws in force in Syria and Egypt which countries were conquered at the same time. 'Umar thoroughly modified the Byzantine laws.¹⁵ The basic source of this attitude was the Qur'an and the Hadith. Such “good customs” of foreign origin may even touch private affairs, such as contractual relations in commerce, industry, etc.

(d) With a small difference, the same source is to be based on the principle of reciprocity. A classical example is the following. Once the governor of the frontier town Manbij (Hierapolis) asked the Caliph 'Umar what tariff should be imposed on traders coming from beyond the frontiers, and the Caliph replied, “Levy as much as their governments levy on Muslim subjects going there for similar purposes.”¹⁶

(e) Certain laws, particularly those concerning international relations, both in peace and war, are often regulated by bilateral or multilateral treaties which were regarded by the Holy Prophet as a valid source of Muslim Law. An example of such laws is the law of extradition based on the Treaty of al-Hudaibiyyah.¹⁷

(f) Even new customs may gradually take root and add to the body of Muslim Law. To express slight nuances they are called 'urf, addah, ta'amul. They are practices and customs limited to localities or classes of people. Needless to say that society is a living organism, and the interaction of circumstances, inventions, and progress made in the material domain profoundly affect our conceptions and, indeed, our practices. The general principle remains valid: such practices should not go against the revealed Law.

(g) One sole exception to this general principle is admitted by the jurists, and they call it “prevalent custom” ('umum al-balwa), which may abrogate even an existing law. Apparently, the theory of the ijma' (consensus) plays its role therein. In practice this touches only minor points of legal rules,

mostly the rules deduced by former jurists. It is unthinkable that such “prevalent customs” could abrogate a law enjoined by the Qur'an.

G - Particular Sections Of The Law

Theologians normally discuss four topics: (i) beliefs ('aqa'id), (ii) acts of worship ('ibadat), (iii) morals (akhlaq), and (iv) social affairs (mu'amalat). The jurists do not concern themselves with beliefs and morals and confine their views only to rules regarding acts of worship and laws regarding social affairs.

Before dealing with Muslim jurisprudence under these two heads, we would like to make it clear that in Islam acts of worship ('ibadat) do not mean acts indicating only the relation between the worshipper and God. In fact, beliefs, acts of worship, morals, and social affairs are all closely related to one another and, therefore, none of them can be considered in isolation. Acts of worship, apart from relating the worshipper to God, directly influence other human beings as well. For example, although zakat is an act of worship in relation to God, yet it is intimately connected with society. It is a State tax collected from and used for the welfare of its members. Similarly, social affairs are not merely matters of relations between man and man but have direct bearing on man's relation with God. In Islam there is no matter which can be considered to be isolated from spiritual values and divinely ordained laws. Every public affair is a means to the achievement of some spiritual value. Therefore, it can be safely said that there is no matter in Islam which is purely an act of worship or a public affair. Every act of worship is a public affair and every public affair is an act of worship.

Jurists generally divide jurisprudence into the laws dealing with (i) acts of worship ('ibadat), (ii) social affairs (mu'amalat), and (iii) crimes ('uqubat). Under the head “acts of worship” fall prayer, fasting, pilgrimage, and zakat (the State tax). Under “social affairs” come socio-political, economic, and financial matters, e.g., sale and purchase, contract, gift, trust, surety, partnership, and matrimonial affairs. Penal laws deal with such crimes as murder, theft, adultery, drinking, etc. It is not possible to deal with every rule within the space at our disposal, not even with every set of rules. Therefore, we content our-selves with discussing some select topics and these too very briefly.

1. `Ibadat

Under this head we deal only with prayer. A prayer or service of worship in Islam is described by the Prophet as the “pillar of the faith” and “ascension” (mi`raj), i.e., a journeying unto the Almighty. In the words of Shah Wali Allah: “Worship consists essentially of three elements: (i) humility of heart (spirit) consequent on a feeling of the majesty and grandeur of God, (ii) confession of the superiority of God and lowliness of man by means of appropriate words, and (iii) adoption of bodily postures expressing reverence. As a man can reach the top of his spiritual evolution only gradually, it is evident that such an ascension must pass through all the three stages, and a perfect service of worship would have three postures, to wit, standing up, bowing down, and prostrating by laying the head on the ground in the presence of the Almighty-and all this for obtaining the

necessary evolution of the spirit so as truly to feel the sublimity of God and the humility of man.¹⁸ At the end, kneeling before the Lord, in the “invocation of the Divine Presence” (tashahhud), the faithful use the very words of the dialogue between the Holy Prophet and God during the mi`raj:

Prophet: “The blessed and purest of greetings to God!”

God: “Peace be with thee, O Prophet, and the mercy and blessings of God!”

Prophet: “Peace be with us and with all the pious servants of God!”

After this a Muslim affirms his submissiveness and attests the formula of the faith, then expresses his thankfulness to God for having sent such messengers as Abraham and Muhammad (both of blessed memory) to guide him. Thereafter, he asks for pardon and well-being in the two worlds. On his “return” from the visit of the threshold of God, he wishes peace to all believ-ers, and with that he terminates his service.

2. Mu`amalat

(a) Polity

Islam has not only united prayer and politics in a greater whole by assigning them both to the same Imam, but it has also dispensed with all prejudices of color, language, race, birth-place, etc., declaring all men equal, basing superiority solely on piety, and taking practical steps to reunify the descendants of Adam and Eve. Allah is not the God of this or that race, He is the Lord of the worlds, both known and unknown (Rabb al-`Alamin). Nationality as based on race, color, or language is fatal in the long run. It is to be based on the identity of outlook on life (religion) accessible to any and every individual, irrespective of race, caste, or color. The common code of Law (the Qur'an and the Hadith), the common focal point for prayer and hajj (Ka'bah), and the unity of the Faith-ful under a common Caliph are some of the means employed for the removal of all class and color distinctions.

In politics, sovereignty belongs to God, and man is the lieutenant and vicegerent of God. This notion works power-fully on man. Islam imposes no particular form of government; the Qur'an never speaks of kingship in connection with Muslim polity. There is not a single reference to republic or oligarchy. Yet the first Muslim Government after the Prophet was a “life-long republic.” The Head of the State did not come to power by inheritance, but was chosen for life. So the State was neither our modern republic, nor the hereditary despotic kingship. The oath of allegiance (bai'ah) was essential even for the recognition of the Prophet himself; and this automatically excluded hereditary monarchy, though the Shiites do not hold this view.

It is obligatory on a Muslim ruler to have consultations; right of veto seems to be a matter left to time and clime. His fundamental duties are four-fold: cultur-al (propagation of Islam), administrative-executive, judicial, and legislative. But legislation by government is the least important of its duties. In Islam, legisla-tion has always remained a privilege of private savants, beyond the control of the rulers with their ever-changing whims and fancies and exigencies of the day-to-day politics. And as we have described above,

legislation in Islam is only for secondary matters; the primary principles have already been laid down by the Qur'an and the Hadith.

(b) Fiscality

As already pointed out zakat is not at all almsgiving or charity, but the State tax, covering practically the entire fiscal system imposed on Muslim subjects. It is significant that the Qur'an prescribes no details as to the income, but gives very precise directions regarding the expenditure of the State. The implication seems to be that the government may have a free hand in increasing the revenues, but in matters of expenditure it should not deviate from the principles of a welfare State. The rates and items of the zakat are mentioned only in the Hadith. That they are not of a static character, is proved by the fact that in the time of the Prophet the import of victuals, effected by caravans of the Nabataeans, coming from beyond the frontiers of the Muslim State, were subjected to ten per cent of duties, but the Caliph 'Umar reduced them only to five per cent. To Ibn Hazm the rates current in the Holy Prophet's time are, for all later generations, the necessary minimum and can be increased only in the interest of the community. Other jurists have resorted to more reverential attitudes. They uphold the rates of the time of the Prophet as the norm, but allow under the name of *nawa'ib* (passing exigencies) enhanced or new taxes.

The expenditure of zakat is much more important. The Prophet of Islam ordained that the income of zakat is religiously forbidden (*haram*) to him, to his family, to his tribe, and to the allies of his tribe. If the Head of the State is so scrupulous and does not abuse public confidence in money matters entrusted to his care, subordinates would be the less tempted to corruption. Further, the Qur'an has ordered that taxes (*sadaqat*) should be spent under eight main heads of expenditure. They are to be levied only for the poor, the needy, the wayfarer, those who work for the State revenues, and those whose hearts are to be won; also for freeing the necks, and the heavily indebted, and for use in the path of God.¹⁹ According to such a high authority as the Caliph 'Umar, *fuqara'* (the poor) are those who belong to the Muslim community, and *masakin* (the needy) are from the non-Muslims. It is to be noted that the *sadaqat* do not come from the non-Muslims, yet the needy among them are the beneficiaries of these taxes paid only by the Muslims.

Those who work are the collectors, accountants, and controllers of expenditure, auditors, and others, embracing practically the entire administrative machinery of the State.

Those whose hearts are to be won may be of many kinds. The great jurist *abu Ya'la al-Farra'* observes: "Those whose hearts are to be won are of four kinds: (i) those whose hearts are to be reconciled for coming to the aid of the Muslims; (ii) those whose hearts are to be won in order that they abstain from doing harm to the Muslims; (iii) those who are attracted towards Islam; and (iv) those by whose means conversion to Islam of the members of their tribes becomes possible. It is lawful to benefit each and everyone of those whose hearts are to be won, be they Muslims or polytheists."²⁰

By the term "freeing the neck," jurists have always understood the emancipation of slaves (which is a duty of the State!) and ransoming the

prisoners of war, be they Muslim or non-Muslim subjects of the Muslim State.

Aid to those who have heavy debts or great burdens may be given in different ways. The Caliph 'Umar organized even a service of interest-free loans.

Expenditure “in the path of God” includes every charitable act, and the jurists from very early times have not hesitated to mention military equipment for the defense of Islam as the first item, since Islam struggles solely for the establishment of the kingdom of God on earth.

As for the wayfarers, one can help them not only by giving hospitality to them, but also by ensuring them physical well-being and comfort, providing means of communication, security of routes, and taking all other measures for their well-being, be they countrymen or strangers, Muslims or non-Muslims.

These items are wide enough to embrace practically all the requirements of a welfare State.

(c) Contracts

Contracts are of many kinds: matrimonial, commercial, agricultural, industrial, and so on. When differences arise as to the meaning of the terms during the execution of a contract, third parties are referred to, such as arbitrators, judges, and other State authorities. This entails questions of evidence and proof and capacity of the contracting parties including the minors, the insane, the absentees, etc. Again, contracts may be made of free accord or under coercion.

In Islam, contracts require the consent of the parties, or “mutual free-will” as the Qur'an puts it.²¹ This great principle, common to all systems of law, is a means to mitigating the rigor of another principle that men being equal to one another, nobody owes anything to anybody else. Contracts include among other things the give-and-take of labor. The give-and-take of labor entails division of labor which has several advantages: saving wastage of concurrent labour, specialization for the sake of better production, diminution of preoccupations with the consequent leisure which is essential for all pro-gress, intellectual as well as material. If everyone of us were to rely on his individual resources to procure even the barest necessities of life-food, dress, lodging, etc.-we should be worse off than most of the beasts.

Custom or usage has taught men the advantages of the exchange of com-modities. Prices are a technique used to equalize two different kinds of items. They are subject to variation according to the demand and supply of goods, and also to the whims of the sellers. Ordinarily, this latter aspect is a man's private affair; the organization of which he is a member need not meddle with it. But there is a limit even to this liberty. Once a merchant was selling his goods in the market of Medina at a price lower than the one prevalent. (We are not told whether it was a case of dumping or any other mis-chief.) The Caliph 'Umar ordered him to leave the public market, or else fix the price as charged by other merchants. Neither the inherent liberty of each nor the mutual consent of the parties could deter 'Umar from ordering what he judged to be right in the interest of social well-being.

Contracts may comprise conditions. There is a huge monographic literature on the subject, and it is related that abu Hanifah was the first to compile a special treatise on the conditions of contracts. Here too mutual consent is not the sole deciding factor; law steps in, and enjoins that no condition is to be tolerated which violates legal injunctions of all kinds.²² Lesser of the two evils justifies to interfere in and curtail the inherent liberty of the individual, since in the long run he too will suffer from the same liberty if left uncontrolled.

The same principle of public well-being (maslahat 'ammah) has led legis-lators to declare inadmissible the contracts made by minors or the insane. Guardians are appointed temporarily or permanently to look after the affairs of those suffering from legal incapacities.

(d) Family Law

Of all the contracts, those of matrimonial relations seem to be the oldest in human society. Here there is no question of exchange of commodities, but rather of usufruct. Muslim Law has relegated matrimony to the level of any other bilateral contract. In pre-Islamic days, people “sold” their daughters to their would-be husbands. In Islam, woman has an individuality of her own as independent and complete as that of man, and is not a chattel even of her progenitive father. For profound social reasons, and in view of the nature of the fair sex, the mutual benefit accruing from married life has been thought to be less favorable to the wife, who is, therefore, considered entitled to a compensation in the form of a monetary gift settled upon her before marriage (mater), dowry, and maintenance by the husband. The mater, which is a sine qua non of Muslim marriage, is the exclusive pro-erty of the wife, giving no right of share to anybody else, not even to her father; and she has full legal powers to dispose of her property-mahr or anything else-the way she likes it (a thing unknown even today in other systems of law).

The question of polygamy may be briefly treated here. According to the generally accepted interpretation of the injunctions of the Qur'an, it may be said that Islam permits polygamy, but which religion does not? Hindu, Jewish, and Parsi religions allow unlimited number of wives to a polygamous husband, and even Christianity is no exception! There is not a word against it in the Gospels and teachings of Jesus Christ; on the contrary, learned theologians (like Luther, Bucer, Melancthon, and others) have deduced that Christ accepted polygamy as a matter of course as is evident from the way in which he speaks of the marriage of a man with ten virgins, mentioned in the Gospel according to St. Matthew 25:1-12.

Further, it was practiced in early Christianity, and as late as the time of Charlemagne (third/ninth cen-tury); even priests could be polygamous.²³ The reference here is not to the mundane rules among Christians and even Muslims to “abolish” polygamy, but to their religious doctrines only. Islam is the first and only religion which has put a limit to the maximum number of wives, and has also provided legal means of prohibiting the practice of polygamy between couples desiring mono-gamy. Marriage being one of the ordinary contracts, conditions can be sti-pulated therein.

The lawful conditions are: (i) the husband would remain monogamous for the duration of the marriage with the stipulating wife, and (ii) the wife would have the right to divorce her husband at will. Christianity formally prohibited divorce, and so did the Dharma Sastra. Islam, on the other hand, permits the right to divorce to the husband under certain conditions, and to the wife under contract, and even without a contract, by an appeal to a law-court-khul'. It also allows judicial separation under orders of the court. And if a woman herself does not demand these rights, it is not for the law to oblige her to do so, since there may be occasions when poly-gamy may even become necessary. Who does not know that after the Thirty Years' War, the Kriegstag of Nuremberg (Germany), in view of the greatly reduced number of the male population due to war ravages, ordered that thenceforth every man should contract marriage with two women?²⁴

(e) Commercial Contracts

The most important point in this connection is perhaps the prohibition of interest. Other religions also had done that before, but with little results. They did not attack the root question, which is: How to supply interest-free loans to the needy? Islam characterizes the taking of interest as “a declaration of war against God and His messenger;”²⁵ in our own time Professor Keynes did not hesitate in his numerous writings to assert that interest more than anything else lies at the root of all social ills. Islam makes a clear distinction between commercial gain and interest on loans.²⁶

The difference between them is that one shares in the former (in various kinds of joint-stock companies) both profits and risks, whereas in the latter the debtor has to pay a fixed profit even if circumstances have not allowed him sufficiently to fructify the enterprise. The thesis of Islam is that one should undertake to participate in the eventual risks in order to participate in the profits (al-ghunum ma' al-ghunum). One should certainly take necessary precautions, even create reserve funds for lean years, but the parties to the contract should be ready to divide losses as well as gains.

As to non-commercial and unproductive loans, it goes without saying that private capitalists cannot offer interest-free loans unless they are most generous and pious. Therefore, it is only a welfare government that can and must do so. As a practical religion, Islam noticed this human weakness and, therefore, made it the duty of the government to provide for interest-free loans to the public in the annual budgets of the State, as we have mentioned above while speaking of zakat. The same could also be done on the basis of mutuality.

In fact, interest-free co-operative lending societies have been a great success, for instance, in Pakistan and Hyderabad-Deccan (India) where they have existed for over a century. The members participate in the working expenditure, and the circulation of the money gradually paid by the shareholders satisfies the needs of the members of the society.

The question of co-operative activity for loans naturally leads to the problem of insurance which has existed in Islam from the time of the Prophet himself. It was further developed in later times. Under the term ma`aqil, the constitution of the City-State of Medina, dating from the year 1/622, the Holy Prophet laid down that the individual shall not be required

to shoulder two kinds of responsibilities alone: (1) payment of blood-money in case of homicide, and (2) payment of ransom for prisoners of war. It was the treasury of the tribe that was to bear these two obligations.

Should the funds of the tribe, periodically contributed by its members, be not sufficient at a given moment, the parent tribe and in the last resort the Central Exchequer must come to aid. In the time of the Prophet insurance against fire had little importance. Incidents of fire occurred only in living quarters which were built by the inhabitants themselves at meagre expense. In later times, marine insurance was introduced among the Muslim merchant class. The Caliph 'Umar is reputed to have reorganized the insurance units, and according to al-Mabsut of al-Sarakhsi, employees of the same governmental department, members of the same cantonment, etc., began to function as units. In still later times, we see insurance practiced by guilds of the same profession in a given locality.

It may be pointed out that unused contributions to such units need not lie idle; they could be utilized for fruitful commerce to build up reserves, and eventually profits could be divided amongst the members of the units. There has been an attempt in recent times of this kind of insurance among the owners of automobiles of a big city, insuring against damages both to their cars and to their persons. Islam has not left this kind of self-help only to a group of capitalists but has proposed it for everyone as a measure against damages in addition to all that the government may do.

(f) Administration of Justice

As explained above, the administration of justice is a necessary concomitant of contractual relations in a society. In-expensive, prompt, and fool-proof-such is the ideal of justice in Islam. In pre-Islamic days, there was declaration of rights by arbiters, but no provision for enforcement. The Holy Prophet gave Medina a constitution which made the execution of judicial awards a central subject leaving it no longer to tribes, much less to the individuals winning their cases. Further, in pre-Islamic Arabia there was no law but only the common sense of the arbiters. There was also inequity in the administration of justice. Powerful tribes, for instance, paid half of the blood-money, and value of women was taken as half the value of men. The said constitution rectified these defects.

Islam established equality not only among Muslims and Muslims, but also among Muslims and non- Muslims, and cases are recorded of the classical period, in which Muslims were executed for having murdered non-Muslims. Evidence was also demanded from the parties concerned. In the very first year of the Hijrah, the Qur'an²⁷ made it obligatory to have written documents of contracts. During his audiences, the Prophet would inquire about the character of the witnesses before admitting their evidence. In later times, every locality established archives of the entire population, constantly revising remarks on personal character. Whenever a man presented himself as a witness, the archives were consulted to admit or reject his evidence. Further, near relatives were declared unfit to give evidence in favor of their kinsmen. In almost all cases, no less than two witnesses were required.

One more peculiarity of administration of justice was the autonomy con-ceded to non-Muslim inhabitants, the principle being, for instance,

Jewish parties, Jewish Law, Jewish courts, and Jewish judges. In case parties be-longed to different communities, a Jew versus a Christian or a Muslim, the conflict of laws necessitated special arrangements; in most cases parties agreed to go to the Muslim courts.

3. Penal Laws

The administration of justice described above applies mutatis mutandis to penal cases. It appears that ordinarily capital punishment was not enforced unless reference was made to the Caliph (Central Government).

In his celebrated farewell address during the last pilgrimage, the Prophet chartered human rights under a triple division: person-property-honor, and affirmed their sacrosanct character once for all.

Let us refer to two verses of the Qur'an regarding punishment:

(a) "Whoever transgresses against you, so transgress against him with the like of his transgression against you? ..." (2: 194).

(b) "The compensation of an evil is an evil like thereof. ..." (40: 40).

The wording of these verses implies that punishment is also regarded as transgression and evil. Although many verses exhort the victim to pardon the transgressor, yet retaliation, a time-honored institution in human society, is allowed as a necessary evil, though never beyond the measure of the original crime and this too perhaps only so long as a suitable cure for the ailment of criminality has not been found.

The penal law of Islam has certain peculiarities. First, it makes a distinction between crimes of fixed penalties (hudud), and those which allow a certain latitude to the judges. The crimes of hudud refer to person, property, and honor. According to the classical jurists, they are eight in number: (a) apos-tasy, (b) homicide, (c) illicit sexual intercourse, (d) false accusation against the chastity of a woman, (e) alcoholic drinks, (f) highway robbery and theft, (g) war, and (h) infliction of injuries.

(a) Apostasy

In all old and most new legal systems treason is awarded capital punishment. We have seen that Islam has rejected color, language, land, and similar other accidents and hazards of nature as the bases of "nationality," and adopted instead the "identity of outlook on life" as the foundation to build a world-wide community. Even with its zeal for religious propagation, Islam admits no compulsion in religion,²⁸ but intends to create a rigorous discipline among those who voluntarily enter its fold. Such seems to be the explanation of considering apostasy as a crime. At times one feels that Islam has needlessly provided for that, since apostasy among Muslims is practically non-existent.

(b) Homicide and Corporal Damages

In such cases lez talionis is not the only alternative: injured persons and the representatives of the murdered person have been given the right to blood-money and appropriate monetary compensation. The blood-money imposed by the Holy Prophet approximately amounts to the maintenance of a man for thirty years (expected life of the victim if he were not murdered!). One hundred camels is the traditional blood-money. During the battle of Badr, when the Prophet heard that the enemy slaughtered one day nine and

the next day ten camels for consumption, he concluded that they numbered between nine hundred and one thousand combatants. If one camel suffices for one hundred days, one hundred camels can do so for about thirty years.

(c) & (d) Sexual Transgression and False Accusations Affecting the Honor of Women

Consent of the parties of adults in sexual relations, even though unmarried, gives them no immunity from the operation of the Islamic penal code. This strictness in Islamic Law at least deters men from behaving like dogs and asses. Despite this rigor the Prophet of Islam has been more indulgent than Jesus Christ (as described by the Gospel according to St. John, 8:3ff.). The Qur'an requires four eye-witnesses for a sexual crime (as against the normal two), or confession on the part of the culprit. Islam also intends to purify society of scandalous talk; if anybody talks of the sexual immorality of a woman, he has to produce at least four eye-witnesses, otherwise he is himself to be given eighty stripes and he permanently forfeits his right to give evidence before a tribunal.²⁹

(e) Alcoholic Drinks

Though the Qur'an has strictly prohibited the use of intoxicants, it has prescribed no definite punishment. The Holy Prophet, however, used to administer forty strokes with his sandals to the intoxicated persons. The Caliph `Umar seeing the expansion of the evil in Muslim society said, "Since intoxication leads to obscene talk and false accusations against the honor of women, I shall henceforth give eighty strokes." (This is the Qur'anic punishment for speaking against the honor of women.) Non-Muslims including the non-Muslim wives of Muslims are, however, exempt from this penalty. But if the representatives of the non-Muslims in a parliament agree on total prohibition, it is to be enforced on them as well.

(f) Robbery and Theft

Crimes against property have been provided with severe penalties. As to the results, it may suffice to refer to a case from con-temporary history. Who does not know the pillaging of the pilgrims, during the time of Sharif Husain? When ibn Sa`ud got power in the Hijaz, he reinstated the Islamic sanctions against theft, with the result that people began to feel that they were given the security of the times of abu Bakr and 'Umar. In 1359/1939, part of the baggage of a lady pilgrim was found missing at an intermediary station between Mecca and Medina.

The police were alerted. Even after two weeks of investigation, the police were unable to trace the thief, but the Sa`udian Government ordered payment of the value of the stolen goods to the victim and the amount was immediately paid. The much maligned punishment of cutting the hands of a thief is waived in the case of theft committed by the needy and according to many jurists also in the case of children and the mentally diseased.

(g) War

As everybody knows, international law means the rules that govern relations of States in times of war, peace, and neutrality. If suppression of theft and robbery requires partial mobilization of the forces of order and

security, foreign invasion requires the same measures on a larger scale. Hence the inclusion of international law by Muslim jurists in the section on penal laws, and its treatment immediately after the section on highway robbery. Apart from its logic, the important point to note is that international law forms an integral part of the Islamic Law and is not left to discretion. In the international law the accused has the same rights of defending his conduct before a tribunal as, say, a robber who is captured and tried. An old author aptly says: “Among the happenings of a certain time a war is like sickness in contrast to peace and security which resemble health. It is necessary to take steps against warlike activities to preserve peace as it is necessary to fight against disease.”³⁰

(h) Infliction of Injuries (Mazalim)

Under this category fall the crimes other than those determined by the hudud. Judges are given wide latitude for inflicting appropriate punishment according to the circumstances of each case. Nevertheless, the ruler has to prescribe certain rules defining the discretionary powers of the judges.

H - Muslim Contribution To Law

1. However unbelievable it may look at first sight, it is a fact that the science of law, in its theoretical sense, did not exist in the world before Islam.

Law did indeed exist in Rome, Greece, China, India, Mesopotamia, Egypt, pre-Columbian America, and elsewhere, yet it was Imam Shafi'i (b. 150/767) who first thought of the science of law or jurisprudence as case-law. His book *al-Risalah fi Usul al-Filth* speaks of the origins and sources of Law, also of the methods of legislation, interpretation and application of law and many allied topics. Al-Shafi'i gave this science the expressive name *usul al-Filth* (the roots of Law) in contradistinction to the general laws of a land, which were named as “branches” (*uru'*) shooting out from these roots. Some generations afterwards, the Muslim jurists created a new science, called *khilafiyat*, i.e., “comparative Law,” restricted to the study of the different schools of Muslim Law and dealing with the grounds and consequences of differences amongst the various jurists.³¹

2. The principle of intention, in spite of much research, has not been found in earlier laws. This was first introduced by the celebrated saying of the Holy Prophet: “Actions are (to be judged) by intentions (*inns-ma al-a'mal bi al-niyyat*),” quoted by al-Bukhari, Muslim, and all the other authorities, the echo of which we hear in the celebrated address of the Prophet given during his last pilgrimage.

3. The idea of ethical value as the basis of legal injunctions is also unique in the legal history of the world. The credit of initiating it goes to the Qur'an.

4. International law has existed in the world since times immemorial, yet in antiquity it was neither international nor law. For, ordinarily, it was reserved only for resolving disputes of a country with certain other countries and nations only; Islam extended its scope to the entire world, without making any geo-graphical and political limitations. Again, in antiquity it was not considered to be law, but formed part of a country's political discretion; Islam made it a part of Law. This is testified by the fact that all

books of Fiqh from the very beginning have dealt with international law under the section named Siyar. Further, before Islam, the subject was treated in books of politics and manuals of statecraft like the Artha Sastra of Kautilya, or the Politics of Aristotle. The Muslims made it an independent branch of Law, and devoted special monographs to it, the earliest of which is attributed to abu Hanifah. The works of the pupils of this master, abu Yusuf and Muhammad al-Shai-bani, have come down to us and have partly been printed.³²

5. The first written constitution of a State in the world, as promulgated by a sovereign, came from the Holy Prophet of Islam. The text constituting the City-State of Medina in the first year of the Hijrah (622) has been pre-served in toto, and comprises fifty-two articles, dealing with such questions as independence vis-a-vis the rest of the world, war and peace, administration of justice, legislation, religious tolerance with regard to non-Muslim subjects, social insurance, asylum, naturalization, etc.³³

6. Lastly, it is interesting to note that the Muslims as a people always kept legislation (and so also judiciary) separate from the executive. The develop-ment of Muslim Law as deduced from the Qur'an and the Hadith has always been the work of private savants and jurists. Tradition has insisted that the State should not interfere with this work, much less monopolize it. It is the freedom of juristic judgment which creates conflicting opinions and alternative solutions, and these provide the coming generations with raw material for sound judgment. These conflicting opinions have given rise to different schools of jurisprudence; yet in one's comparative study of international law in Sunnite, Sh'i'ite, and Kharijite schools and their sub-schools one is agreeably surprised that, despite their water-tight divisions, there are practically no differences of vital significance.

I - Interactions

Ernest Nys (in his *Les Origins du droit international*, which has also an Urdu translation published by the Osmania University) shows the great in-fluence of Muslim international law, particularly on Spanish Christian writers, who first inaugurated the study of international law in modern Europe. Later on, the Dutch Hugo Grotius, who is considered to be the father of international law, also refers to Muslim practices. Many savants allude to the Muslim influence on the famous Code Napoleon, the basis of modern Western legislation. Many provisions of the Islamic law of inheritance, divorce, etc., are now being adopted by and necessary modifications made in Hindu Law by the modern Indian legislature.

Foreign elements in Muslim Law have already been shown in the section on "Sources." Far from being the chief determinant of the growth of Muslim Law, as it is sometimes claimed, Roman law in its influence on Muslim Law has been of the least significance.³⁴ No early Muslim jurists, except al-Auza'i hailed from an ex-Byzantine territory. All of them were either the Hijazian Arabs or belonged to Persian families which had lived as Muslims for at least two generations. Even al-Auza'i was not of Syrian origin for his father was among the captives brought from Sind.³⁵ And, therefore, he could not be suspected of having inherited any part of the Byzantine traditions.

J - Further Possibilities

A modest yet practical procedure to adapt Muslim Law to present conditions has been suggested in the colloquium recently published by the "Law Number" of the Karachi monthly Chiragh-i Rah. Muslims should not remain content with their past, however glorious that past. The *raison d'etre* of their existence is their constant struggle to become the very best community, a model for the whole of humanity-the community enjoining the good (ma'ruf, interdicting the evil (munkar), and believing in God.³⁶

4. Perhaps it will be useful to remind that Islam in the pre-Hijrah period had no temporal authority and the Prophet proceeded gradually from suggestion to recommendation before finally ordering and prescribing sanctions. In the Meccan period there was neither a fixed amount, nor a fixed time of the year, nor even an organization to collect and disburse the taxes; all these measures were taken during the Medinese period. The sense of the terms with regard to taxes underwent a profound change when "charity" became a State duty; the Qur'an and the Hadith retained the old terms, with the advantage that the people were persuaded to believe that to pay tax to the government was no less meritorious in the sight of God than charity and almsgiving, and that zakat was the best kind of charity. The Caliphs retained the same terms.

Chapter 62: Geography

Chapter 63: Mathematics and Astronomy

Chapter 64: Physics and Mineralogy

Chapter 65: Chemistry

Chapter 66: Natural History

Chapter 67: Medicine

Chapter 62: Geography

Philosophy in the past ages was not merely an academic subject studied by specialists; it was a living influence which guided men in their ideas about the universe and it included a variety of fields covering theology, law, society, and the sciences. To the Muslims during the Middle Ages philo-sophy and its various disciplines were all-embracing. Geographic ideas were inseparable from philosophic thinking as they were basic to a widening of horizons. Indeed, interest in geography is as old as recorded human history. This had its roots in ancient folklore, poetry, and travel. The geographical instinct in one form or another developed early among organized human communities, and the people of the ancient civilizations possessed a variety of geographic knowledge.

It is well known to historians that the culture of Greece was preceded by a continuous and composite culture in Western Asia and Egypt and that this culture in its turn was not the product of the genius of any one people, but was shaped by an ever-increasing human intercourse and was the fructi-fication of a long evolution. Thus, Greek geographical ideas too had a basis in the past and in the experience of other peoples. Philosophy and poetry formed the tap-roots of the geographic knowledge of the Greeks. Similarly, in Arab times both Greek ideas and Islamic philosophy and literature were potent factors in the evolution of geographic concepts.

Early Greek contributions to geography were as varied as they were bril-liant. Later on, Alexander's campaigns were of the nature of geographical exploration under arms. In the course of time the center of scientific activity shifted to Alexandria. Science and geography continued to flourish in the Greco-Roman age, though under somewhat different cultural atmosphere. In fact, the Greco-Roman culture was subjected to a terrible ordeal. It witnessed one of the greatest intellectual conflicts in history, the clash between Greek ideals and the various oriental religions, chiefly Judaism and Christianity.

But before Christianity could triumph, the great geographer Ptolemy (c. 150 A.D.) had accomplished his work of coordinating the sum total of geographic knowledge up to his time, though a little earlier Strabo (c. 19 A.D.) had contributed even more brilliantly in terms of geographic analysis. He had also indicated the extent of the knowledge of the Romans about the land and people of Arabia. Describing Gellus' expedition in 25 B. C. to Haura on the Red Sea coast to the borders of Hadramaut, Strabo says that the Emperor Augustus was also influenced by reports of the wealth of the Arabs and their trading activity in spices, aromatics, and precious stones, and that he desired either to befriend or subdue such opulent people.¹

By the third century A. D. distinct changes had taken place in the political, cultural, and religious spheres. The Roman Empire came near to utter break-down. The legions, never too many for the long frontiers and made increasingly heterogeneous by local recruiting, lost their sense of mutual cohesion and failed to check stronger outside attacks. Many emperors rose and fell like ninepins, un-mourning, unsung. Rome was sacked by Goths in 410 A.D. By the middle of the sixth century A. D., Justinian's final efforts at consolidation of the Roman power had failed.

The commencement of the middle Ages is important in the history of science in general and geography in particular. A general retrogression is witnessed and gradually the so-called “Dark Age” of geography set in. It is common to begin the middle Ages from Constantine, but Paganism was tolerated almost until the division of the Roman Empire in 395 A.D. The tradition of pagan literature and science, however, continued much longer, at least until Justinian closed the school of Athens.

The triumph of Christianity led its adherents to consider scientific research not only a useless occupation but also a pernicious one. Alexandria had lost its noble place as the center of scientific activity, and Egypt for the Christians had become a land of new wonders as the first home of hermits or desert men or monks; some visitors had no interest in anything else and dismissed the pyramids as mere “Granaries of the Kings.”² A sailor turned monk took a hand at geographical writing and produced the crankiest of books, the famous Christian Topography, in 547 A.D.

The main purpose of this erudition was to disprove the pagan notion that the earth is a globe. Cosmas hailed from Alexandria and had in his younger days traded in the Red Sea and even beyond. Cosmas' earth was flat, rectangular, and oblong, twice as long from east to west as from north to south, and was surrounded by ocean. A high mountain rose in the north behind which the tiny sun played hide and seek to bring forth days and nights. Beazley rightly called Cosmas' work a “systematic nonsense.” Saint Ambrose saw no profit in investigations about the earth. Science, geography, and all such pursuits were dubbed as magic art. The spherical shape of the earth and the existence of antipodes were favorite subjects of ridicule.

Thus, the geography of the early centuries of the Christian era was a fascinating mixture. Perhaps it seldom represented the full amount of contemporary knowledge and was largely made up of traditional elements, Christian and classical, blended in various proportions. The first came from a literal reading of the Scriptures and other-worldly attitude of the protagonists of the Church. It appears that Christianity spread first through the urban commercial population round the Mediterranean, whose lingua franca was Greek. It was only later on that it penetrated into the hinterland and overspread into the vast rural areas of outer provinces. Thus, Greek science received a frontal attack in its most important centers. In this refutation of earlier knowledge, interest in science and rational geographic concepts could be retained only by a handful of people in Christendom. Only the Nestorians, the Monophysites, and some of their adherents kept a semblance of Greek science preserved.

During the first/seventh century there arose an epoch-making movement from the depths of the Arabian Peninsula. It was Islam. It brought about the establishment of one of the greatest empires the world has seen. The Arabs conquered a large number of peoples who were superior to them in culture. Nevertheless, the conquerors did not lose their national characteristics and subjected Syria, Mesopotamia, Egypt, and North Africa to their ethno-graphical influences.

As soon as early conquests were over and cultural contact was established with Greek and Indian knowledge, Muslims became imbued with tremendous curiosity and took up the cause of science with enthusiasm at different centers of their culture. Early Islamic attitude to science was one of tolerance, even enlightened interest. It is evidenced by the continuance of the academy at Jundi-Shaper as a scientific center in the Muslim Empire. Scientists from this center in Persia were welcomed at Damascus, the capital of the Umayyad Caliphate. These men were mostly Christians and Jews.³

Further, the Arabs were traders, travelers, and lawyers, and they had somewhat positive minds and, therefore, practical sciences appealed to them. Arabic was suitable for exact and precise sciences and lent itself more easily to the formation of technical terms. Geography especially appealed to them because of its utility to serve the needs of commerce, the division of land, travel through the deserts, knowledge of the plants and animals, and to find the azimuth of Mecca and the phases of the moon.

The Arabs had a traditional interest in matters concerning geographical knowledge. Even before the birth of Christ and after, they were among the foremost traders and navigators of the Arabian Sea, Indian Ocean, and Chinese waters. The Arabic language of that period abounds in words for ships, boats, condition of the sea surface, storms, heavenly bodies, and commodities of exchange and trade. These activities were greatly influenced by the geo-graphy of the Arabian Peninsula and its midway position between the East and the West and the littoral situation of all its fertile lands in Yamamah, Oman, Bahrain, the Yemen, etc. Even the Hijaz, though largely arid, lay along the trade-routes from the Arabian and Red Seas to the Mediterranean world.

Pre-Islamic poetry contains references to navigation and sailings, and the Holy Qur'an itself abounds in navigational terminology and descriptions of conditions of the sea and ships and boats used. There was a close relation-ship between land journeys as well as between sea voyages and the knowledge of stars and other heavenly bodies. The inland Arabs with scanty agriculture and nomadic economy were always face to face with such problems as sources and extent of grazing opportunities, distribution of desert plants and animals, and the nature of geomorphological features. Therefore, Arab interest in geo-graphical matters was a deep one. It needed various stimuli such as extension of territorial influence, expanded trading opportunities, greater cultural con-tacts, and a vigorous religious zeal to widen the frontiers of geographic knowledge.⁴

Within a century of the advent of Islam, the Arab victories brought them a rich reward in the conquest of prosperous lands and cultured com-munities, from the Mediterranean to India and Central Asia. On the one hand, the Arabs became the heirs to the Hellenistic culture for which a way was earlier opened by the conquest of Alexander. On the other, they reached the homeland of Indian culture and Buddhist and Indian thought. It is rightly assumed that the Arabs became the pupils of and successors to the Greeks in science and, through their own efforts and ingenuity perfected it for the future protagonists.

Indian influence in the first instance was the product of a continuing commercial contact via the sea-route from Ujjain, the town of Brahmagupta (c. 6/628), the famous writer of the astronomical manual *Brahma Siddhanta*. Muslim conquest of Central Asia brought them into touch with Buddhism and old Greek colonies in the regions of Bactria, Sogdiana, Farghanah, and Merv.

The establishment of the 'Abbaside Caliphate in 132/750A.D. ushered in an age of glory, power, pomp, splendor, culture, and prosperity for the peoples under Muslim rule. Scientific activity took its birth and in this process the inauguration of translation activity in Baghdad, systematically organized under a Translation Bureau (*Bait al-Hikmah*), was a tremendous step forward. The Bureau had a library and permanent personnel, and translators were commissioned from far and wide. Manuscripts were even paid for their weight in gold. The main aim was to make available in the Arabic language the wisdom and the science of the Greeks and others.

Translations also included works in many sciences by an array of able translators. Among the sciences which received special attention were physics, meteorology, mineralogy, botany, astronomy, and geography. The early phase of translations was concerned more with medical and philosophical works, but later on mathematical, astronomical, and geographical subjects received more attention. The Caliph al-Mamun took active interest in the work of his translators and scientists. Among his great achievements were the measurement of a degree of the earth's arc on the plains of Sinjar, west of Mosul, and the construction of a world map. Both the tasks were of great geographical significance and were accomplished by a team of scientists.

The period of early translations was of great importance to the developing intellectual and scientific life of Muslim society. The Greek writers, who influenced the Arab scholars most were not poets, historians, or orators, but largely the scientists in various fields such as mathematics, astronomy, medicine, philosophy, and geography. For instance, the scientific works of Aristotle received far greater attention than did the writings of Plato and Socrates.

Before the content of Muslim contributions to geography is examined, a few points must be clarified. The birth of scientific activity under Islam has indispensable relevance to Muslim geographic thinking. The passage of Greek science to the Arabs revealed to them Hellenistic geographic concepts which had received slashing denunciations from orthodox Christian writers. Therefore, the first task of Arab geographers was the revival of the older science.

Muslim geographers held Ptolemy in high regard and greatly valued his monumental work. But he did not escape their criticism, and numerous improvements in his concepts were suggested. Even Ptolemy was not able to combine the mathematical with the descriptive and statistical methods in geography. As regards the latter, Strabo was far more alive and was more critical in his writings than Ptolemy. These traditions were passed on to Arab writers and, therefore, quite a number of Muslim geographers can be categorized under them. But Arab geographers branched out into so many

new directions and were so prolific in their output that a somewhat broader classification of their contributions is called for. Muslim interest in geography was stimulated by a variety, of factors such as environmental, religious or spiri-tual, administrative, political, and commercial.

Muslim military campaigns were well planned and superbly executed and the generals and commanders collected much geographical data before conducting their operations. The organization of administration, collection of revenue, and appraisal of resources of the newly conquered territories required detailed geographical information. It is said that the great Caliph 'Umar, hearing of the conquest of new lands, asked a scholar to describe to him the lands of the earth, their climates and positions, and the influence which land and climate exert upon their inhabitants.⁵ Both scholars and religious leaders considered geography a laudable pursuit, as is borne out by the remark of Yaquit that as a science geography was pleasing in the eyes of God. Even the orthodox al-Ghazali believed that the votaries of science will find the road to paradise easy. Muslim religious interest in the determination of latitude and longitude of places and in the diurnal movement of the sun was indispensable both in connection with the time for daily prayers and the geographical co-ordinates of Mecca. With the expansion of the dominions of the Muslim Empire, commercial activity increased and geographical information of different types became vital for its growth and development.

Regional geography received early attention and contained an enormous wealth of details and information. It developed its own traditions, and the variety in approach to it and the ingenuity of the individual geographers make many contributions to it a fascinating reading. The writings of notable travelers, the specialist studies of the topographers, and the critical works of the socio-geographers lend an immense variety and color to Muslim geography. There-fore, it may be convenient to examine the Muslim contribution to geography under the following headings:

- (A) General and Regional Geography.
- (B) General Treatises and Scientific Geography.
- (C) Mathematical Geography.
- (D) Cartography and Map-making.

A - General And Regional Geography

Muslim interest in general geographical writing developed early. This class of geographical writing has a wide range and includes some of the earliest contributions in this field. General geographical descriptions of the Muslim world were a favorite theme and in view of the needs of administration and extension of the postal services many works were written as "Route Books." Diaries and travel accounts were yet another category of geographical writing. As a result of the unsatisfactory basis of descriptions in relation to hypothetical "Climatic Divisions" in parallel latitudinal strips (a Greek legacy) many Muslim geographers felt the necessity of describing the dominions of Islam on the basis of regions of which they possessed more specific know-ledge. It may be said to be the beginning of a regional consciousness.

Among the earliest known works dealing with geographical matters are those of 'Abd al-Malik ibn Quraib al-Asma'i and Hisham ibn Muhammad al-

Kalbi. Al-Asma`i of Basrah (123-216/740-831) wrote on plants, animals, and the evolution of human society. Al-Kalbi (d. 205/820) was an authority on the history of pre-Islamic Arabia and it is said that his work *Kitab al-Nawadir*⁶ contained observations on many geographical topics. Similarly, one of the early treatises on agriculture was ibn Wahshiyyah's (c.288/900) book on Nabataean agriculture. Abu Yusuf Ya`qub al-Kindi (c. 260/873-874), though primarily a philosopher and physicist, wrote a geographical work called *Rasm al-Ma`mar min al-Ard* (Description of the Inhabited Part of the Earth).

But the work of Muhammad ibn Musa al-Khwarizmi (d. 236/850) laid the foundation of Arab geographical science. By writing *Kitdab surat al-Ard* (Treatise on the Face of the Earth) he syncretized Greek and Hindu knowledge. He was a mathematician of great repute and is said to have collaborated in the degree measurements ordered by Caliph al-Mamun. He improved Ptolemy's geo-graphy, both as regards the text and the maps. His scientific attainments are universally acknowledged by the Orientalists. Another early geographical work which was concerned with Arabia was that of Arram ibn al-Asbj al--Sulami (c. 231/845) who wrote *Kitab Asma' Jibal Tihamah wa Makaniha* dealing with the mountains of Tihamah in Arabia. This work was mentioned by al-Sirafi, and another book by the same author bearing the title *Jazirat al-'Arab* was mentioned by Yaqut in his "Dictionary of Learned Men" (*Mu`jam at-Udabu'*)⁷

1. The Route Books

After the early geographical writings mentioned above had appeared and the initial phase of translations had come to an end, an interesting class of geographical literature was produced which is contained in the so-called "Route Books" (*Kutub al-Masalik w-al-Mamalik*). Quite a tradition developed in the writing of these route books and many later authors copied the technique of the earlier masters. In this respect, ibn Khurdadhbih (c. 300/912) blazed a new trail with his famous *Kitdab al-Masalik wa-al-Mamalik* (A Book on Routes and Kingdoms). He provided an excellent summary of the main trade- routes of the Arab world and also wrote descriptions of China, Korea, and Japan. The work served almost as a source for later writers. Unfortunately, only an abridged version of the book is extant.

Al-Marwazi (d. 274/887) also wrote a route book which was mentioned by ibn al-Nadim and Ya'qub. Sarakhsi (d.286/899), who was a pupil of al-Kindi, gave the same title to his geographical work and abu al-Faraj al-Baghdadi (d. 310/922) compiled *Kitab al-Kharaj* (Revenue Book) dealing with land tax and postal services in the context of the geography of the Arab Empire. Al-Jaihani (fl. c. 280-295/893-907), the learned minister at the Samanid Court, wrote another revenue book replete with geographical explanations, and it is surmised⁸ that it was one of the source materials for al-Idrisi. Abu Zaid al-Balkhi (d. 322/933) produced another route book along the traditional lines, but his real fame as a geographer rests on his somewhat more scientific contribution, namely, *Kitab al-Ashkal or Suwar al-Aqalim* (Figures of the Climates).

Al-Istakhri (fl. c. 339/950) followed in the footsteps of his senior contemporary al-Balkhi by writing a similar book and using the technique of explaining maps by the accompanying text. Ibn Haugal revised and rewrote Istakhri's book with considerable additional information in 367/977. These three geographers form an important group who combined their writings of descriptive geography with carto-graphic work and scientific analysis and, therefore, this category of their work will receive mention later on.

In Spain, al-Bakri (d. 487/1094) of Cordova used the same technique and method to write his route book and geographical dictionary notable for their useful information about Europe and North Africa.

2. Books of Countries and Dictionaries

The route books were written from an administrative angle but they in-variably developed into geographical treatises. They were generally concrete, accurate, and detailed.⁹ Closely related to the route books, yet enlarging on their scope and subject-matter, were the large number of "Books of Countries" and geographical dictionaries and gazetteers. Among the early writers of such tracts and a notable Arab geographer and historian was al-Ya'qubi who wrote *Kitab al-Buldan* (Book of Countries) in 278/891, giving a wide range of topographical and economic details and occasionally bringing out the relationship between physical factors and human activity.

Topographical details about the cities of Kifah, Baghdad, Samarra, and Basrah and regional descriptions of many areas in Arabia, Syria, Egypt, Nubia, and North Africa, are some of the outstanding features of this book. His pioneer work as a geographer deserves high praise, and it is not surprising that modern European writers often call him the father of Muslim geography. Shortly before Ya'qubi an outstanding historical work with many geographical observations had been written by al-Baladhuri (in 256/869) under the title *Futuh al-Buldan* (Conquests of Countries). This work typifies Muslim interest in the history and geography of the newly acquired territories. Al-Hamadani's "Book of Countries" written in 290/902 was utilized by notable geographers like Mas'udi and Yaqut; unfortunately, it is lost. A contemporary of al-Hamadani was Ibn Rustah (fl. c. 291/903); his encyclopedia *al-A'laq al-Nafisah* dealt with geographical matters in its seventh volume. He discussed a variety of topics including the extent of the earth, seas, rivers, climate, founding of Mecca and Medina, and the regional geography of Iran.

Ibn Rustah's account of the road system of the empire and particularly of the great Khurasan road remains outstanding for its clear details and geographic implications. A few years later Ibn al-Ha'ik (d. 334/945) presented his regional geography of Arabia in *Kitab Jazirat al-'Arab* dealing with physical features, minerals, races, tribes, and settlements. He also contributed a semi-geographical work *al-Ikhlil* on the archaeological aspects of the Yemen. Muhallabi (375/985) was the author of an outstanding geographical work dealing with the Sudan. It was the first work of its kind for this remote region and formed Yaqut's main source for the geography of the Sudan.

An interesting geographical work of the fourth/tenth century written in Persian was entitled *Hudud al-'Alam* (c. 372/982) by an unknown author. It

is meant to be a world geography on a regional basis and was probably written as a preface to a map. Minorsky has produced an excellently edited and annotated version of this notable work.¹⁰

The western wing of Islam in Spain also produced many contemporary geographers who wrote route books, books of countries, and works of regional descriptions. Al-Tariqi (d. 363/973) wrote on North Africa. Al-Bakri of Cordova (d.487/1094) was a celebrated geographer who compiled a geographical dictionary, *Mu'jam ma Ista'jam* as well as a route book. These works incorporate fresh material on Central and Eastern Europe and North Africa. Al-Zuhri of Granada (c.532/1137) was the writer of a notable work, *Kitab al-Jahrafia* (Book of Geography). It appears that al-Zuhri was able to utilize the work of the team of geographers of the reign of Caliph al-Mamun. Al-Munajjim (d. 456/1068) was the compiler of a geographical dictionary which both al-Idrisi and ibn Khaldun mention as one of their source materials. And there were many lesser lights who followed these masters in compilation.

But the art of depicting geographical and associated information in the form of a dictionary attained its highest form from the pen of Ya'qub Hamawi. His work was done almost at the crossroads of history, shortly before the Tartar invasion engulfed the eastern lands of Islam. After considerable travel in his younger days and study in several libraries, he produced his monumental geographical dictionary known as *Mu'jam al-Buldun* in 621/1224. This great work contains a geographical gazetteer, a regional world geography, and much topographical, historical, and archaeological information. It deals with geography in the broadest manner. His other well-known work *Mu'jam al-Udaba'*, dealing with lives of learned men, is also replete with geographical information. Yaqut utilized a variety of sources including many of those which are now extinct. His dictionary 'contains a treatise dealing with geo-graphy in general from many points of view.

3. Diaries and Travel Accounts

Travel has always been the easiest and the most natural means of acquiring and propagating geographic knowledge. In the medieval period of Islam travel was promoted in many ways. Religio-cultural affiliations with far-flung parts of the world, curiosity, commercial enterprise, and above all the urge for pilgrimage excited widespread interest in travel. Thus, Muslim travel literature in the shape of diaries and descriptions and experiences of journeys contains a treasure-house of geographical information.

For Muslims, the pilgrimage to Mecca was not a matter of choice; it was their positive duty within the limits of possibility to undertake it. Mecca was the ever-present magnet to attract their thoughts and thus there ran into Arabia a constant stream of visitors from all parts of the Islamic world. The *hajj* every year was a unique international assemblage by which people from distant lands, diverse environments, and varied experiences exchanged ideas and acquired knowledge of countries and inhabitants of the world. It was a tremendous incentive to the spread of geographical knowledge.

With the spread of Islam and the extension of its political influence, trade and commerce greatly expanded resulting in the knowledge of new lands. In

the Euro-Asian continent these regions were the Volga-Caspian, Northern Europe, and Siberia on the one hand and Central and South-East Asia on the other. The African continent received far more attention from the Muslims than from their predecessors. The East African coast up to Madagascar, Egypt, Nubia, Abyssinia, the Sudan, Equatorial Africa, the Sahara, land of the Niger, and West Africa, all came within the range of their commercial, cultural, and religious activities.

Travel and commerce walked hand in hand. Each geographical discovery created new commercial opportunities, and these, with attendant competition and inherent ambitions, led to more travel and discoveries. At a later period the Crusades, besides their sordid side, provided for generations a great and prolonged avenue for contact between the East and the West for exchange of ideas and cultural assimilation. Trade, commerce, and travel were promoted and helped the circulation of geographical information.

Ibn Fadlan went as an envoy of Caliph al-Muqtadir to the Court of the Volga Bulghar in 309/921 and is credited with the first reliable account of Russia. He may, in fact, be regarded as one of the earliest Muslim traveler-geographers. His Risalah or diary is of great geographic significance. His description is the earliest reliable account of Russia and was incorporated into the works of many later geographers including Yaqut.¹¹ Another experienced early traveler was abu Dulaf who hailed from Yanbu' near Medina. He combined poetic talents with a wander-lust. After a stay at the Samanid Court at Bukhara, he went to South India across Tibet with a returning Indian embassy and the journey back was made via Kashmir, Afghanistan, and Sijistan (c. 331/942). His narrative of journeys was entitled `Aja'ib al-Buldun (Marvels of Countries). Abu Dulaf's geographical impressions of the Indo-Pakistan sub-continent and the adjoining areas were utilized by Yaqut and Qazwini. Among early Muslim travelers, al-Idrisi mentioned Sallam who visited the region north of the Caspian Sea, Armenia, Georgia, land of the Khazars, and the Ural and Altai areas in the middle of the third/ninth century at the command of Caliph al-Wathiq.¹²

With increasing Muslim influence in Indian littoral areas and expanding commerce in South-East Asian waters and on the Chinese mainland, more detailed and somewhat accurate geographical information was in demand. The busiest and flourishing ports on the Arabian coast and Persian Gulf were Aden, Oman, Suhar, Jeddah, Siraf, and Basrah. Their commerce and overseas relations were mainly with East Africa, Indian coasts, South-East Asia, and China. Siraf especially occupied a pre-eminent position and grew into a port-city of merchants, princes, and experienced sailors.

One of the early writings on trade and commerce and navigational matters in these regions was that on the journeys of Sulaiman the Merchant by an anonymous author (237/851) with the additional comments on it by abu Zaid al-Sirafi. The work gives us information with regard to duration of the journey, its various stages, ports of call, nature of commodity exchange, wind and weather, and conditions of the seas. The descriptions display an excellent geographical sense and an understanding of physical and human aspects. Sulaiman's description of the Chinese mainland, its products and economic resources is realistic. He also mentions the Chinese use of tea.

Interest in the Indian Ocean and its bordering lands continued for generations and Muslim sailors and travelers wrote on many topics which encompass geography.

Abu Zaid al-Hasan of Siraf edited accounts of Muslim travelers and sailors in c. 308/920 in order to supplement Sulaiman's narratives. According to him, ibn Wahb travelled to China in 257/870 and there were other voyages in that direction. Abu Zaid's compilation was probably entitled *Akhbar al-Sin w-al-Hind* (Information about China and India). It may be said to be the most important work of its kind before that of Marco Polo or of ibn Battutah. Besides the Far East, it deals with the Arabian and the East African coasts. From such voyages and confirming somewhat earlier traditions also, gradually developed the stories and fascinating fables around the name of "Sindbad the Sailor" found in the *All Lailah wa-Lailah*. Another writer about the trade, commerce, navigation, peoples, and products of the Indian Ocean area from Arabia to Ceylon and beyond was Buzurg ibn Shahryar who compiled the interesting book *'Aja'ib al-Hind*¹³ (Wonders of India) in about 342/953-954.

The famous "sea lions" (expert writers on nautical instructions), mentioned by Ahmad ibn Majid in the second half of the ninth/fifteenth century, were not mere expert navigators, but also writers on sea voyages and route books. Muhammad ibn Shadhan and Sahl ibn Aban belonged to the fifth/eleventh and sixth/twelfth centuries. Perhaps there were many more such writers; at any rate, later on, their successors were Ahmad ibn Majid (895/1489), Sulaiman al-Mahri (early tenth/sixteenth century), Piri Rais, Sidi 'Ali, and al-Sifaqsi (959/1551) who displayed a remarkable knowledge of the geography of the Indian Ocean.

The scene in the Mediterranean was somewhat different to that in the Indian Ocean. In the latter, trade, commerce, and adventure were the impelling factors in Muslim enterprise, but in the former prolonged political struggle, religious wars, commerce, and pilgrimages were motivating features behind sailings and voyages. There is record,¹⁴ however, of the close co-operation between Muslims and Christians in the formation of joint partnerships and of commercial treaties, carriage of passengers in ships irrespective of their religion, and the transport of products of skilled industry and luxury goods from the Islamic world to Europe.¹⁵

Before mention is made of the well-known traveler-geographers in the western lands of Islam, those in the east deserve attention. Among these intelligent globe-trotters and geographers, al-'Mas`udi (d. 346/957) deserves pride of place. He was born in Baghdad towards the end of the third/ninth century. Mas`udi acquired his knowledge through painstaking study of the existing sources as well as through extensive travels. His travels carried him to many parts of Arabia, Levantine coast, Caspian shores, Asia Minor, Iran, Iraq, India, South-East Asia, East African coasts, and Egypt. He met common men possessing practical knowledge and scholars of repute. Mas'udi's acute observations and views depicting a keen geographical sense are contained in his famous book, *Muruj al-Dhahab wa Ma'ddin al-Jawahir* (Meadows of Gold and Mines of Precious Stones), a historic-geographical encyclopedia written in about 336/947 and revised ten years later.

It seems to be an age of great travelers, as not many years later ibn Hauqal (fl. c. 332-367/943-977) completed a travel of thirty years which excited his interest in geography. His meeting with the celebrated geographer al-Istakhri was significant, as at the latter's request he re-wrote his geography and revised the accompanying maps. Ibn Hauqal called this improved version, *Kitab al-Masulik w-al-Mamalik* (Book of Roads and Provinces), and added maps of each country to this remarkable treatise. .

Yet another outstanding geographer and traveler was al-Maqdisi or al-Muqaddisi, a native of Jerusalem. He travelled through many Islamic lands except perhaps Spain, Sijistan, and Sind. By all standards he was a careful observer and had an inborn geographical sense. On the culmination of his travels he wrote his famous geography *Ahsan al-Taqasim fi Ma'rifat al-Aqulim* (Best of Divisions as Regards Climates) at Shiraz in Fars in 375-376/985-986. His writings reveal much original information and are an attempt at analysis of physical and human factors. His sources include several earlier geographers like Khurdadbeh, Jaihani, Balkhi, Hamadani, and Jabiz. But he subjects his authorities to considerable criticism.

The tradition of travel and that as a medium for geographical work continued. One of the junior contemporaries of al-Biruni was Nasir Khusrau from Balkh, where he was born in 394/1003. Starting his travels from Egypt, he visited a large part of the Middle East including the Hijaz, Palestine, Syria, and Iran. Earlier, he had travelled in India¹⁶ and lived at the Court of Sultan Mahmud. His travel diary, the famous *Safar-Nameh*, was written in Persian. He gives the best account of Jerusalem before the Crusades, and his description of Egypt is of high geographic value. Shaikh 'Ali al-Harawi (d. 611/1214) wrote a travel book dealing not only with the frequented places of pilgrimage in the eastern part of the Islamic world, but also of Byzantine Empire, North Africa, and Abyssinia. He was in Jerusalem in 569/1173 when it was in Christian hands. He visited the Christian parts of the world on several occasions.

The western world of Islam produced several traveler-geographers who also made journeys to the east to perform the pilgrimage to Mecca. Al-Mazini al-Andalusi (d. 565/1169) was an intrepid traveler who came from Granada and journeyed through Spain, North Africa, Egypt, Iraq, Khurasan, and Russia. He travelled in the Volga region and in Hungary and gave information unobtainable elsewhere, such as the Russian trade in fossil bones or ivory.¹⁷ He was the writer of at least four important geographical works.¹⁸

Another celebrated geographer ibn Jubair of Valencia (d. 625/1217) wrote a valuable account of his journey to the east. His accounts throw an interesting light on the geography as well as the commercial activity and culture of the Muslim communities of the Mediterranean lands. Ibn Jubair's writings were a source book for many later Muslim geographers and historians. His *Rihkah* (Travel Account) remains one of the best works of its kind in Arabic literature.¹⁹ Ibn Jubair's fellow townsman al-'Abdari (fl. c. 688/1289) commenced a memorable journey to accomplish the pilgrimage.

Starting from Mogadore on the West African coast of Morocco he made the journey both ways by land and thus crossed North Africa twice. His

travel geography al-Rihlah al-Maghribiyah contains valuable topographical information.²⁰ Al-Mausili wrote 'Uyun al-Akhbar (a book of travels) at Ceuta after his travels through Syria, Pales-tine, and Egypt during 537-585/1142-1189.

Though al-Idrisi was an all-round geographer and his proper place is among the writers of scientific geography, his travels were an indispensable part of his geographic experience. He was born at Ceuta in 493/1099 and educated at Cordova. His travels covered a vast compass stretching from Muslim Spain and North Africa to Christian Europe as well as other parts of the Islamic world. Rich in experience and mature in his outlook, al-Idrisi settled down at Palermo in Sicily at the Court of his worthy patron King Roger II. He died in 562/1166. His famous geography *Nuzhat al-Mushtaq fi Ikhtraq al-Afaq* (known as *al-Kitab al-Rujari*), written shortly before 549/1154 is the most elaborate description of the world of medieval times. According to Sarton²¹, al-Idrisi was the author of another geographical work entitled *Raud al-Uns wa Nuzhat al-Nafs* (Pleasure of Men and Delight of Soul), a kind of a route book which the author compiled for William I, King of Sicily, in 557/1161. This geographical work was said to be larger than the *Kitab al-Rujari* but unfortunately it has been entirely lost.

Abu al-'Abbas al-Nabati of Seville and his pupil ibn al-Baitar of Malaga were biographers and they travelled in Spain, North Africa, and along the shores of Red Sea with the purpose of scientific exploration in connection with their work.

Ibn Said al-Maghribi was another indefatigable traveler, profoundly interested in geography. He was born near Granada in 611/1214 and died in Damascus in 674/1275. His *Kitab al-Jaghrafiya* embodies the experience of his extensive travels in the Muslim world, and the geographical information and views in it added to al-Idrisi's knowledge. He also gives an account of parts of northern Europe including Iceland. Ibn Said visited Armenia also and was at the Court of Hulagu from 654/1256 to 664/1265.

Half a century later, in 704/1304, was born ibn Battutah, one of the out-standing travelers of all times. Starting from his home town, Tangier, in 726/1325, when he was barely twenty-two years old, he travelled in Africa, Asia, and Europe for thirty years. His journeys included several pilgrimages to Mecca and travel to and residence in many parts of the Middle East, India, Ceylon, Maldives, Bengal, China, North Africa, Spain, and the lands of the Niger. The extent of his wanderings is estimated at about 75,000 miles²² without allowing for deviations, a figure which surpasses Marco Polo's travels. Ibn Battutah's dictated accounts of his experience to ibn Juzaiy at the Court of Sultan abu 'Inan at Fez constitute his *Rihlah* (Travels). The book contains references to the economic and human geography of the areas visited, trade, commerce, ports, navigation, and numerous physical facts with occasional analysis of causes and effects. His memory was astounding and geographical sense remarkable. Ibn Battutah died in Fez in 779/1377. In the western world of Islam, the tradition of travel leading to geographic writings was handed down to ibn Khaldun who was born in Tunis in 733/1332 and died in 809/1406. Much of his well-known writings as a geographer, historian, and sociolo-gist was based on his travels in Spain

and North Africa. The scientific significance of his “Introduction to Universal History” (Kitab al-'Ibar) will be discussed later.

In the East, Muslim travel-cum-geographical accounts from the eighth/fourteenth century to the tenth/sixteenth century are represented by Hafiz Abru, 'Abd al-Razzaq Samarqandi, abu al-Fadl'Allami, and Amin Ahmad Razi of Rayy. Hafiz Abru wrote his regional geography in Persian, entitled *Zubdat al-Tawarikh*, which was modelled on the earlier Arabic classical style. Barthold²³ has a high opinion of the material in it relating to the author's time. 'Abd al--Razzaq was born in Herat in 816/1413 and died there in 887/1482. He travelled to India and enjoyed a diplomatic career; on his return he wrote an excellent diary *Mafia' al-Sa'dain wa Majma' al-Bahrain* in Persian. In the generations that followed the advent of the Europeans into the Indian Ocean, Muslim interest in geography and travel was not dimmed. Abu al-Fadl, born at Agra in 958/1551, was a leading light at the Court of Akbar the Great. His *A'in-i Akbari* written in Persian remains an outstanding geographic contribution of his age, a parallel to which is hard to find in the contemporary West.²⁴ Amin Akimad Razi of Rayy visited India in Akbar's time and later in 1002/ 1593 produced his *Halt Iqlim* (Seven Climates), an exhaustive geographical dictionary in Persian. Another contemporary author who wrote at Damascus in 1007/1598 on the basis of personal travels was al-'Ashiq, the writer of *Manazir al-'Alan* (Description of the World).

B - General Treatises And Scientific Geography

The climax of Muslim geographical contribution is represented by the formulation of geographical theories and the compilation of treatises in which attempts were often made to assemble facts and put forward theories. Indeed, their level and scientific value are unequal; none the less, the attempts as such are interesting and praiseworthy. The later half of the fourth/tenth century was productive of many such efforts and it would not be too much to assert that such abundant activity in science and geography had never occurred before, not even in the best days of Alexandria. The “Keys of the Sciences” (*Mafatih al-'Ulum*) of al-Khwarizmi, the “Encyclopedia” (*Fihrist*) of ibn al-Nadim and the “Tracts of the Brethren of Purity” (*Rasa'il Ikhwan al-,safa*) remain the monumental examples of these efforts.

Throughout the ages arm-chair geographers have made mistakes which have been easily recognized by practical men. Ptolemy was no exception and so were many Arab literary geographers, but, on the other hand, many Muslim geographers, rich in their personal experience and deep in learning, pointed out flaws in the works of their predecessors. Mas'udi,²⁵ for example, is well known for such criticism as sprang from his universal outlook, and al-Biruni, Maqdisi, abu al-Fida', and others expressed opinions contrary to established notions.

In their geographical writings, new methods were evolved and new shape was given to traditional treatment. The arbitrary division of the then known world on the basis of “climates” originated by the Greeks was quite often copied by Muslim geographers. But the careful and discerning ones like al-Istakhri, al-Balkhi, Maqdisi, and several others found this method

unsatisfactory and somewhat confusing and felt that these divisions in geo-metrical strips, more or less along the latitudes, were without consideration of the geographical factors. The need of some other method of treatment was realized.

Al-Istakhri initiated a regional approach to his descriptive geo-graphy by selecting either geographical units or political divisions closely corresponding them. His own words explain his technique.²⁶ “I do not take the 'seven climates' as a basis for the division of the earth because the geometrical shapes, even though correct intrinsically, lead to great con-fusion; so I have resorted to the study of the earth country wise.” In fact, most of the leading Muslim geographers of the fourth/tenth century on the basis of their writings would have done credit to any period.

Arab regional geography developed a tradition of its own by describing the physical environment of an area as well as its people and their cultural and social activities, though sometimes the treatment of cultural matters led to rather deterministic generalizations, reflecting on people's characters and peculiarities. Surprisingly enough, many modern geographers, historians, and sociologists are not immune from this weakness; they often build their cultural theories on foundations of sand. The method and technique of geographic descriptions of diverse lands evolved by al-Istakhri, ibn Hauqal, al-Maqdisi, al-Mas'udi, and others was later adopted by al-Qazwini, abu al-Fida', and ibn Khaldun, especially the last named who, by his analysis and interpretation, anticipated modern sociology and human geography.

A few examples of scientific geographical writing deserve mention. The tracts produced by the Ikhwan al-Safa (Brethren of Purity) had considerable geographical information and views. Theirs was a rationalist approach to many problems. Their secret association was founded at Basrah in about 373/983. This encyclopedic effort by several anonymous writers, many of whom were interested in scientific geography, is noteworthy. Their treatises include numerous references to the then current geographical concep-tions and attempt to explain them for popular understanding. Among their physical treatises meteorology receives much attention, and explanations are offered for the occurrence of rain, the march of seasons, and layers of the atmosphere²⁷ Geological processes are explained and attention is devoted to weathering and denudation. Plant-geography, distribution of animals, and a general consideration of ecological conditions does not escape their notice.²⁸

The influence of physical environment on human activity and animal behavior and their relationship with health and material well-being were subjected to somewhat critical analysis by several fourth/tenth-century writers on geography. Al-Jahiz (d. 254/868) of Basrah had a real interest in the natural and anthropological sciences. In his “Book of Animals” (Kitab al-hayawan), besides writing on a variety of subjects, he interestingly tackled questions of evolution, struggle for existence, and adaptation. Abu Zaid al- Balkhi writing in 309/921 was a maker as well as an interpreter of maps. His remarkable work Suwar al-Aqalim (Figures of Climates) was a critical study based on maps. A few years later Mas'udi (d. 345/956) used his vast experience and critical abilities remarkably well in dealing with geographical matters. Mas'udi has often been designated²⁹ as the Muslim

Pliny, but he displayed far greater critical ability and scientific curiosity³⁰ than Pliny in his description of earthquakes, waters of the Dead Sea, geological phenomena, navi-gational problems, and ebb and flow of tides.

He also made the first mention of wind power and windmills in Sijistan. Another work of al-Mas'udi's, *Kitab al--Tanbih w-al-Ishraf* (Book of Indication and Revision), sets forth his views on evolution. *Akhbar al-Zaman* contains discussion on the origin of seas, cycle of river erosion, etc. Al-Maqdisi (375/985) was yet another scientifically minded geographer who derided the arm-chair conceptions of some of his great predecessors³¹ and took upon himself the task of writing a geography of the Islamic world based on travel and observation. The result was one of the finest geographical treatments of regions and provinces of the Muslim domains in medieval Arabic literature.³² He stressed the point that geography was a subject of great usefulness and was, therefore, of interest to people in all walks of life. "The Model City" (*al-Madinal al-Fadikah*) of al-Farabi (d. 339/950) is a fine sociological study of urban conditions of his time in which he envisages better future town-planning.

Ibn Sina (370-428/980-1037) expressed views and expounded ideas on almost all subjects with equal clarity. He made a profound study of various physical questions. His views on the origin of mountains and valleys have a flare of modern concepts and his treatise on minerals remained one of the chief sources of geological knowledge in Western Europe until the Renaissance. Ibn Sina's *al-Urjuzat al-Sina'iyyah* (*Cantica*) displayed an excellent under-standing of human and environmental factors. But Ibn Sina's contemporary Abu Raihan al-Biruni (363-440/973-1048) who has his place among world scientists of all times was a traveler, philosopher, mathematician, astronomer, geographer, and encyclopedist.

Sarton rightly remarks³³ that his critical spirit, toleration, love of truth, and intellectual courage were almost without parallel in medieval times. His works were written in Arabic, partly in Khwarizm, the town of his birth, and largely in Ghazni and India where he spent the rest of his life. Through the patronage of Sultan Mahmud and his two successors Mas'ud and Maudud he was able to visit India, learn Sanskrit, and acquire knowledge of Indian sciences. His *Kitab al-hind* (*Book of India*), written in 421-22/1030, provides numerous instances of his geographical concepts covering such matters as the origin of the plains of Northern India, nature of rainfall, commercial activity, roads, frontiers, and boundaries.³⁴

Among his many other writings the "Chronology of Ancient Nations" (*al-Athar al-Baqiyah*) was written at Khwarizm in 391/1000, "Canon Masudicus" (*al-Qdnun al-Mas'iidi*) at Ghazni in 421/1030, and the "Book on Mathematics" (*Kitab al-Talhim*) like the one on stones³⁵ (*Kitab al-Jamahir fi al-Ma'rifat al-Jawahir*) towards the later years of his life, during the reign of Sultan Maudud. Al-Biruni was truly a scientific geographer and discussed all matters from a critical point of view.³⁶

Yet another contemporary was Ibn Sa'id al-Qartabi al-Andalusi (420-463/-1070) who lived and worked in Toledo. Though he was a leading astronomer and historian, he tackled geographical problems scientifically. His *Tabaqat al-Umam* paid special attention to the history of science. The

ethno-geographical and sociological views expressed by him in this work were based on environmental considerations. A few generations later, al-Idrisi, with a background of Andalusian education, extensive travels, and cultural contact with Christendom, produced his elaborate geographical works. His work can be said to be the most notable example of the fusion of ancient, Arab, and medieval geography. He was critical of Ptolemy's ideas. Ibn Jami described Alexandria and discussed its climate.

'Abd al-Latif's book on Egypt may be considered to be one of the most important topographical works of the Middle Ages. In this work attempts at analysis on the basis of known facts and theories are discernible though they are not necessarily geographical. Al-Zamakhshari's (d. 539/1144) *Kitab al-Amkinah w-al-Jibal w-al-Miyah* was a worthy geographical dictionary. Ibn Sa'id al-Maghribi's main work was a geographical treatise entitled *Kitab al-Jahrafiya*. Though it was based upon Ptolemy and al-Idrisi, it contained many facts which had been discovered since then and included the geographical co-ordinates of every important place. His extensive travels and long residence in the east and later the patronage of Hulagu gave him the opportunity to become a connecting link between his predecessors and the mathematical geographers led by Nasir al-Din al-Tusi at Maragha. Some of his ideas were derived from al-Hasan al-Marrakushi (627/1229).

A notable writer of scientific geography was Zakariya al-Qazwini (600-682/ 1203-1283). He is noted for his two works,³⁷ namely, *'Aja'ib al-Makhlūqat wa Ghara'ib al-Mawjudat* (Cosmography, or Marvels of Created Things) and *'Aja'ib al-Buldan* (Marvels of Countries). A later enlarged edition of his geography was called *Athar al-Bilad*. Qazwini's works exerted a deep influence upon the Arabic-speaking people as well as on those reading Persian and Turkish. Muhammad ibn Mahmud al-Tusi also wrote a cosmography in Persian. A notable treatise on commercial geography was written by 'Abd al-Rahman ibn Nasr under the title *Nihayat al-Rutbat al-Zarifah*.

In the seventh/thirteenth century, Abu al-Fida' al-Ayyubi (b. 672/1273) was an outstanding geographer who had thoroughly assimilated the earlier geo-geographical contributions, especially those of Ptolemy, al-Idrisi, and Ibn Sa'id. His main geographical work *Taqwim al-Buldan* displays extensive knowledge and balance in the selection of information. Abu al-Fida's geographical work has earned high recognition among modern European geographers.³⁸ The geographical work of Hamd Allah Mustaufi, *Nuzhat al-Qulub*, written in 741/ 1340 in Persian is a comprehensive geography of the Islamic world. Iran and Central Asia receive special treatment, changes in the course of the Oxus are mentioned, and descriptions are given of the hot springs and oil-wells of Baku and the islands of South-East Asia.³⁹ His historical work, *Tarikh-i Guzideh* (Select History) also contains useful geographical interpretations. A contemporary of Mustaufi was al-Dimashqi (d. 728/1327). His cosmographical work, *Nukhat al-Dahr fi 'Aja'ib al-Barr w-al-Bahr*, was in the traditional style, but is remarkable for its knowledge about the Coromandel Coast of South India.⁴⁰

Ibn Khaldun's "Universal History" (*Kitab al-Ibar*) with its masterly Prolegomena raised the art of geographic interpretation to new heights and

made him the forerunner of modern human geography and sociology. He not only wrote a critical history but combined ethnography and geography with it.⁴¹ Ibn Khaldun recognized different types of habitats and explained the influence of environment on human development. He marked the rise and growth of cities and noted examples of bad siting leading to rapid decay.⁴² He also gave a critical appraisal of the industrial and agricultural resources of Anda-lusia.

Though the ninth/fifteenth and the tenth/sixteenth centuries witnessed epoch-making geographical discoveries and the frontiers of knowledge of the European people were rapidly widened, yet the scientific traditions of Muslim geography did not cease abruptly. The Turkish school of geography achieved much by way of prolific writing as well as scientific treatment. Some of these works are al-'Ashiq's *Manazir al-'Alam* (Descriptions of the World) written at Damascus in 1007/1598, Haji Khalifah's encyclopedia, *Kashf al-Zunun*, and Auliya Chelebi's travel book, *Tarikh-i Saiyah*. Before an evaluation of Muslim geographical conceptions is made and its influence on European mind and thought briefly indicated, two other aspects of their work may be briefly outlined, namely, mathematical geography, and map-making and cartography.

C - Mathematical Geography

Muslim astronomical and mathematical work extends over several centuries and is enormous in its content and commendable in quality. Here only a brief outline is presented in so far as it concerns geographical matters, i.e., latitudes, longitudes, eclipses, and tides; shape, size, and the movements of the earth; and the general mathematical implications in geodetic work.

Historically, Muslims devoted early attention to astronomy and mathematics; the first period of translations led to contributions in these fields. Eventually certain centers and areas developed strong traditions of their own. For example, Baghdad in particular and Iraq in general got an early start in this respect. But later on, with the decline in the influence and prestige of Baghdad, many other parts of the eastern world of Islam became centers of mathematical work and its application in associated fields. The Ghaznawids, Buwaihids, and Mongol princes patronized these sciences. Similarly, works and traditions in North Africa from Egypt to Maghrib and in Andalusia achieved their own characteristics.

The Indian, Iranian, and Greek influences played their part in stimulating early attempts. Al-Fazari's *Kitab al-Zij* (Tables) reflects strong Indian influence. The first series of regular observations with accurate instruments were conducted at Jundi-Shahpar during the first half of the third/ninth century and were utilized by Ahmad al-Nahawandi and others. Ya'qub al-Kindi's works and those of others such as Yahya ibn Mansur, Sanad ibn 'Ali, and al-Marwarzuri were concerned with the preparation of astronomical tables. Earlier, Ptolemy's *Almagest* had also been translated by al-Nairizi.

But the outstanding event in the field of mathematical geography was the measurement of a degree, under the orders of Caliph al-Mamun, to determine the size of the earth, in latitude 36° north.⁴³ An observatory was built on the plain of Tadmur (Palmyra) for geodetic as well as astronomical

work. On the Caliph's instructions two degree measurements were made near Tadmur and Raqqah under the supervision of the sons of Musa ibn Shakir. The result of these two measurements was the calculation of the earth's circumference as 20,400 miles and the diameter 6,500 miles⁴⁴ respectively.

A large map of the world was also drawn. The three sons of Musa ibn Shakir, besides being men of means, were practical scientists. One of their books was concerned with the measurement of the sphere and the trisection of the angle. Besides al-Khwarizmi and al-Kindi, the great astronomer abu Ma'shar of Balkh (d. c. 272/836) was especially interested in celestial phenomena. Al--Mahani (fl. 240-254/854-868) studied the eclipses of the sun and the moon and also the conjunction of the planets.

In later generations, particularly under the patronage of the Buwaihid Court, a great deal of astronomical and mathematical work was done and the making of observations with better designed and perfected instruments became common. A glorious period in this respect was the time of 'Adud al-Daulah and Sharaf al-Daulah, when measurements and observations relating to equinoxes, solstices, eclipses, and the form of the earth were undertaken. Ibn al-'Alam, al-Razi, al-Kuhi, and abu al-Waft' were among the leading lights of this wonderful age.

In the course of time, Cairo also developed into an important center for work in mathematical geography. The Caliph al-'Aziz (365-386/975-996) founded an observatory near Cairo and al-Hakim continued to patronize it. Ibn Yunus (d. 399/1009) was a great mathematician and astronomer and ibn al-Haitham a notable physicist. In point of time, al-Biruni's work again needs a mention here, for his monumental work "Canon Masudicus" was written in 421/1030. He was a great mathematical geographer and devoted himself to many problems, including the accurate determination of latitudes and longitudes, geodetic measurements, simple method of stereographic projections, earth's shape, axis and rotation, and laws of hydrostatics. Al-Biruni's contemporary, ibn Sina, the celebrated philosopher, produced treatises on astronomical instruments, earth's position in the universe, and heavenly bodies.

In North Africa, Tangier, Ceuta, Fez, and Morocco became centers of scientific work relating to mathematics. An outstanding scholar and practical geographer was al-Marrakushi, the writer of Jumi' al-Mabadi w-al-Ghayah (The Uniter of the Beginning and the End) which is considered to be one of the greatest scientific contributions of the seventh/thirteenth century. It includes terrestrial co-ordinates of 135 places of which thirty-four were conducted by the author himself. Al-Marrakushi was fully conversant with scientific methods and made use of many instruments. In Spain, mathematical geography flourished like the other sciences.

Among outstanding votaries was Maslamah al-Majriti (d. 398/1007) of Madrid who made a synopsis of al-Battani's tables. His works were translated into Latin under Alfonso. Al-Zarqali (420/1029-481/1088), besides being well up in theoretical ideas, was a maker and designer of many instruments and astrolabes. He also became well known in Europe through profuse Latin translations of his treatises. The philosophers and

rationalists Jabir (Geber), ibn Aflah (d. 535/1140), ibn Rushd (Averroes) (d. 595/1198), and ibn Bajjah (Avempace) (d. 533/1138) were all interested in the mathematical side of geography.

In the eastern Islamic lands, in later generations, the Saljuq period was productive of much scientific work in mathematical geography, particularly the reign of Jalal al-Din Malik Shah (r. 465-485/1072-1092). The Mongol princes turned out to be great patrons of scientific activity. Hulagu Khan (d. 664/1265) had many mathematicians at his Court and a great observatory was set up at Maraghah on the shores of Lake Uruniyeh, fifty miles from Tabriz. Nasir al-Din Tusi was the leading light. The Maraghah astronomers were greatly interested in geography. For example, al-Tusi's *Tadkirah* (History) in its third chapter deals with geodetic matters and seas and winds. Qutb al-Din al-Shirazi s (634-711/1236-1311) *Nihayat al-Idrak* is devoted to astro-nomical, meteorological, and geographical questions. Al-Qazwini and al-Watwat also wrote on cosmogeographical and geographical matters.

1. Instruments and Their Use

The work in the field of mathematical geography would not have been possible without instruments and observatories. Therefore, it is not surprising to find the mathematicians and geographers working in observatories and using self-made as well as standard instruments and devices. Some of the common needs and requirements included measurement of distance between two points, determination of latitude and longitude, levelling and measure-ment of heights, geodetic measurements, and co-ordinates of Mecca. An account of the instruments devised, developed, and used will be given in the next chapter on “Mathematics and Astronomy” of this work.

2. Determination of Latitudes and Longitudes

Muslim efforts in the measurement and determination of latitudes and longitudes were considerable. They contrived methods as original as the results which were often accurate. The view that the work of Muslim geographers and astronomers in no way surpassed the *Almagest* of Ptolemy, is undoubtedly without any basis.⁴⁵

The early Arab astronomers, al-Khwarizmi, al-Farghani, Habash al-Hasib, and al-Battani, made use of Indian and Greek methods of finding latitude. But better techniques soon began to be employed. The sons of Musa ibn Shakir at Baghdad determined the city's latitude, accurate within a minute, and ibn Yunus at Fustat (near Cairo) did remarkably accurate work. He drew attention to the fact that while reckoning latitude from the shadow of the gnomon, errors up to 15 minutes crept in as the shadows were cast from the upper edge of the sun and not from the central point.

Ibn al-Haitham (355-430/965-1038), known in Europe as Alhazen, wrote a notable work on the calculation of latitudes. He recommended the method of taking a fixed star for the precise determination of the altitude of the pole, and he was fully aware of the errors due to refraction. Al-Biruni suggested the method of determining latitude by reference to the relation of the circumpolar stars to the sun. But in the measurement of longitude, he advocated as well as demon-strated the use of the terrestrial calculation. By

this method he presented a correction in the distance in longitude between Alexandria and Ghazni.

The difference in longitude between Baghdad and Ghazni found by al-Biruni by the terrestrial method was remarkably accurate. Qanun al-Mas'udi, Kitab al-Hind, and Kitab al-Tafhim are the repositories of calculations. Other almost exact calculations were those of the three sons of Masa ibn Shakir at their observatory in Baghdad, of al-Mahani at Surra Man-Ra'a, of ibn Yunus at al-Muqattam, and of Ulugh Beg at Samarqand. An outstanding correction as a result of Muslim calculation was the elimination of the Ptolemaic exaggeration of about 17 degrees in the length of the Mediterranean.

3. The Earth's Shape, Size, and Movements

Opinion on the sphericity of the earth was divided in the early Middle Ages. Cosmas' fantasies were opposed to it, while St. Augustine reluctantly conceded the globular shape, but vehemently rejected the concept of people inhabiting the antipodes. Muslim geographers and other scientists had a firmer belief in the sphericity of the earth as they continued to support, in general, the Eratosthenian theory of climate. Probably, the majority held the idea of an earth globe floating in space. Outstanding examples of Muslim experiments based on belief in the sphericity of the earth and the measurement of a degree were those conducted by the geodetists of al-Mamun in the plains of Sinjar, and al-Biruni's measurement of 56 miles 0' 50" 6" for a degree conducted in India was remarkable for its accuracy.⁴⁶ Early Muslim opinions on the question of the earth's shape are summarized by the geographer ibn Rustah in his famous treatise "Work of Costly Treasures" (c. 291/903).

As regards the movements of the earth, the position was somewhat different. The question whether the earth was at rest or not, was not discussed in Europe either in the early or later Middle Ages. Generally, the earth was assumed to be at rest in the center of space. Al-Biruni, assuming the vague Babylonian and Indian conceptions, believed in the turning of the earth on its own axis. He also believed in the movement of the sun round the earth, though he did not reject the suggestion of abu Said Sinjari regarding the possible movement of the earth round the sun.

In the second half of the seventh/thirteenth century the question of rotation was taken up by 'Umar al-Katibi al-Qazwini (d. 676/1277), who was connected with the Maraghah observatory and prepared an edition of the Almagest. His work Hikmat al-'Ain contains argument for the heliocentric theory. Unfortunately, he finally rejected the idea of the circular motion of the earth and, therefore, failed to anticipate Kepler and Galileo. Among others, who took up this question, was Qutb al-Din, a pupil of Nasir al-Din Tusi. His semi-geographical work, Nihayet al-Idrak, contains a discussion of these questions. Thus, Muslim mathematical geographers often expressed doubts on Greek and Ptolemaic concepts about the earth. Sarton⁴⁷ rightly emphasizes that the doubts expressed in Arabic writings were not sterile as they eventually paved the way for the Copernican reform in 1543.

D-Cartography And Map-Making

Muslims inherited the Greek and Babylonian traditions in map-making. In the past, there had existed a close relationship between extension of maritime activity and navigation and the development of cartographic skill.

The Arab and Muslim knowledge of the seas far surpassed that of their predecessors. It encompassed familiar areas from the Mediterranean to the Atlantic and from the Red Sea, Arabian Sea, and Persian Gulf to the Indian Ocean and the Pacific. Their extensive sailings on these waters were not merely naval expeditions, but were made in pursuit of an extensive commercial and maritime activity in which the crossings of the Mediterranean formed but a small part. This necessitated the use of sea charts, coastal information, and knowledge of wind and weather. Therefore, one class of Muslim map-making was devoted to these objectives, while geographers and others made many maps to depict land information and the political and regional composition of the Islamic world as well as of the then known inhabited areas.

On the whole, Muslim map-making and cartography generally advanced the older knowledge and techniques. The traditions of Roman cartography were poor. Even Ptolemy had made a fundamental error in underestimating the earth's size. He had accepted the figures of Posidonius (1 degree = 500 stadia) on the basis of which Europe and Asia were supposed to extend over one-half of the surface of the globe, while their extension covered only 130 degrees. He had also estimated the length of the Mediterranean to be 62 degrees instead of 42 degrees. The Muslim geographers had corrected this error, but European cartography persisted with this mistake up to the end of the tenth/sixteenth century.⁴⁸

Muslim geographers constructed celestial and terrestrial globes and studied the problem of projections. Their maps were superior to those of Ptolemy, and it became a somewhat general practice to draft maps to accompany the geographical treatises. This is borne out by many examples. Al-Khwarizmi's *Kitab Surat al -Ard* was written in explanation of maps which might have been based on Syriac versions of Ptolemy. The world map, prepared at the behest of Caliph al-Mamun and embodying the collaboration of no less than seventy experts, can be considered to be a notable example of scientific map-making. Unfortunately, this map is not extant. It has also been suggested⁴⁹ that there was a collection of maps of Iran including a pre-'Abbasid world map, which may very well be called "Iran Atlas." In order to indicate the possibility of such a series of maps, it may be pointed out that ibn al-Faqih mentions a map of Dailam which was made for Hajjaj ibn Yusuf, and al-Baladhuri notes in his *Futuh al-Buldan* that a petition to Caliph al-Mansur was supported by a map of the canals of the Basrah area.

In the evolution of Muslim cartography, the Balkhi School represents a distinct advance. Al-Balkhi's atlas included, besides a map of the world, maps of Arabia, the Indian Ocean (Baler Fars), Maghrib, Egypt, Syria, the Mediter-ranean Sea, and several other parts of the Islamic world. This atlas was devoted to the geographic description of the areas covered by the maps and also presented a division of the world into the so-called "Climatic

Zones.” Konrad Miller in his *Mappae Arabicae* fittingly calls it “An Islam Atlas.” It is most unfortunate that the fruits of Balkhi's effort have been lost and only the copied material by al-Istakhri and ibn Hauqal has been handed down to posterity. A follower of these traditions was al-Maqdisi who explained the basis of the drawings of al-Istakhri and then made his own regional maps of the world, using symbols and a color scheme for physical features which made his maps almost similar to modern maps.⁵⁰

Al-Biruni made a round map of the world in *Kitab al-Tafhim* to illustrate the position of seas, and in *al-Athar al-Baqiyah* (*Chronology of Ancient Nations*) he discussed methods of celestial and terrestrial projections. Al-Idrisi's fame as a map-maker has found universal recognition. He is said to have made seventy maps of climatic divisions, a celestial sphere, a globe of silver, and a world map on a silver plate with great cartographic skill. His maps give a better representation of the western world of Islam than that of the eastern. His cartographic effort influenced his European contemporaries and successors in many ways. In later generations, al-Qazwini and al-Wardi made maps based on the lingering traditions of the Balkhi School. Two celestial globes were made by 'Abd al-Rahman al-Sufi in Cairo in about 432/1040; a bronze globe was made by ibn Hula of Mausil in 674/1275. Mahmud Kashghari, in his *Diwan Lughat al-Turk*, made a world map in 734/1333.

Finally, a brief mention of the Arab sea charts, navigation manuals, and the early development of the portolani (European sea charts) is relevant to the subject. The most extensive Arab navigational activity was from the Red Sea and the Persian Gulf to the various parts of the Indian Ocean along East Africa and South-East Asia. Sailing ships were exposed to the hazards of wind and weather and were directly influenced by the sub-tropical and equatorial changes in meteorological conditions. The monsoons were a great factor in these sailings. Therefore, it is not only a fair guess but has a basis in fact that safe sailings were conducted with the accumulated experience of generations of seamanship as well as sea charts and instruments. As regards instruments, the compass may be considered fairly certain, and the greatly perfected astrolabe was also put to use. In the East, the peak of Muslim navigational achievement was reached on the eve of the Portuguese incursion into these waters. In the West, the Mediterranean sailings were most common. There are also on record some attempts to probe into the mysteries of the Atlantic.

The dream to reach the riches of India and China by sailing round Africa was an ancient one, but the Muslims' mastery of North Africa, their dominion in the Iberian Peninsula, and the urge to spread Islam and commerce to yet newer lands, revived a new interest in the venture. The sailors and navi-gators of Muslim Spain were the first in the field, the Genoese sailors came after them. The Portuguese maritime activity took a still later place in history. Among Muslim writers, al-Mas'udi and al-Idrisi have mentioned the attempts of their co-religionists. Al-Mas'udi mentions in his *Muruj al-Dhahab* the venture into the Atlantic before 346/957 by Khashkhaf of Cordova, and al-Idrisi relates the story of the Maghrurin (the deceived ones). These sailors were eight cousins who set out from Lisbon

(before 439/1147) and sailed westward for about eleven days, then in a southerly direction for twelve days when they reached the inhabited Isle of Sheep (Jazirat al-Ghanam); after further navigation of twelve days they landed on another island where they were made prisoners. It may be a fair surmise that the first island was the Madeira and the second the Canaries.

To turn once again to the East, there were successive generations of pro-fessional Muslim pilots and writers of nautical instructions throughout the fourth/tenth to the sixth/twelfth century. The pilots (mu'allim or musta'mil al-markab) and "Lions of the Sea" acquired great fame from the first half of the sixth/twelfth century onward. To this period belong Sahl ibn Aban, Mubammad ibn Shadhan, and Laith ibn Kablan. Later, Ahmad ibn Majid wrote *Kitab al-Fawa'id fi Usul al-Bahr* in 895-896/1489-1490 and Sulaiman al-Mahri produced his ' *Ulum al-Bahriyyah* in the early tenth/sixteenth century. Shihab al-Din Ahmad ibn Majid was an expert sailor as well as a writer of nautical instructions and his role in guiding Vasco da Gama's ship across the Arabian Sea in 904/1498 is well recognized. According to Barros, ibn Majid showed the Portuguese admiral a map of the whole coast of India indicating meridians and parallels. He also expressed no surprise or sense of admiration on seeing the Portuguese navigational instruments and is said to have commented that Muslim sailors in the Indian Ocean possessed more efficient devices and instruments. In fact, ibn Majid and al-Mahri may be regarded among the early modern writers on nautical matters. Their know-ledge of the geography and meteorology of the Red Sea and the Indian Ocean was extensive.

Between 867/1462 and 896/1490, ibn Majid wrote thirty nautical texts. Of these, the most important work was *Kitab al-Fawa'id*. The book is a com-pendium of knowledge relating to the principles of navigation both theoretical and practical. It deals with matters connected with the origin of navigation, use of magnetic needle, routes across the Indian Ocean, latitudes of harbors in that ocean, the China Sea, regional description of large islands, monsoons and their dates, and banks and reefs of the Red Sea. This work was of great use to those engaged in navigation and preceded the European navigation in Eastern waters.⁵¹

Sulaiman al-Mahri was a younger contemporary of ibn Majid. He wrote five treatises on sailing instructions. Of these the third was entitled *al-Umdat al-Mahriyyah fi Dabt al-'Ulum al-Bahriyyah*. This work deals with nautical astronomy, sea-routes in the Arabian Sea and Indian Ocean, monsoons, and some outstanding voyages.

One of the main cartographical achievements of the Middle Ages was the preparation of sea charts which were extensively used by seamen and sailors in the Mediterranean and the Black Sea, from the end of the seventh/thirteenth century onward. These are known as "portolani" and were largely produced by the Genoese, Pisans, and Italians. The languages used in these early Western maps are Latin, Catalan, Italian, or a sort of Mediterranean lingua franca composed of various Romance elements.⁵² Their origin appears to be debatable, though many Western scholars stick to a single source theory, namely, European Christian. Perhaps the Western portolani owed their development to sailors and cartographers in their own

area. But it is almost certain that the Arab pilots, guiding ships across the Indian Ocean and South-East Asian waters, must have very keenly felt the need of such maps. In the form in which Western portolani have been handed down, it is not possible to say which ones were earlier.

But as related above, Muslims had been actively engaged in navigating the extensive and dangerous Eastern seas up to China and across the mesh of islands in South-East Asia since the third/ninth century onward; they had sea charts as mentioned by al-Maqdisi in the later part of the fourth/tenth century. While writing about his extensive sea journey over the Indian Ocean, he says⁵³ that he was often in the company of ship-masters and pilots and other experts who had long experience of sailings in these areas and possessed a detailed knowledge of wind and weather and the physical and commercial geography of these seas and their adjoining lands. He adds that he had seen in their possession sailing charts, directories, and nautical instructions, many of which he himself utilized to compile his own work.

Marco Polo also refers to the Arabs' use of sea charts and maps. It is said that Qutb al-Din Shirazi, the geographer of the Itkhans of Persia, used one such map to mark the progress of the Mongol envoy to Christendom. Indeed, it is quite conceivable that the early portolani were made after centuries of experience before their Mediterranean and Atlantic samples came to be drafted. It is, however, true that the number of Muslim portolani is small as compared with the Western ones.

As a criticism of the quality of Muslim cartography it may be admitted that often it overemphasized decoration at the expense of accuracy. But it will be well to remember that contemporary Western cartography was most rudimentary by comparison and the latter mappae mundi were a mixture of fact and fancy. Much has been written in recent years to throw light on the achievement of Muslim map-makers. The labors of Konrad Miller, Prince Youssouf Kamal, and Kramers have been very rewarding and have presented Muslim cartography in a new light.⁵⁴

E - Influence Of Muslim Geography

The question of the extent of the influence of Muslim geography on the European mind is an interesting one. Usually it is claimed that the develop-ment of medieval European as well as that of early modern geography was somewhat independent. This view appears to be untenable and is rather out of date, as its basis is emotional and it disregards the inevitable links of history. Moreover, a brilliant galaxy of European scholars including many Orientalists, through their painstaking researches into the sources of modern science, have produced indisputable evidence of the transmission of Muslim science to European communities. Here it is possible to present only the main points of the transmission of Muslim geographical knowledge and concepts to the West.

Even during the first half of the fifth/eleventh century, necessary conditions for scientific work did not exist in the Latin West, or for that matter in the whole of Christendom, as they did in the Islamic world. It was only Jewish thought which was moving forward due to direct contact with Muslim culture and under the stimulus of its progressive impulses. No doubt, some Christians in the Muslim world did contribute to these efforts.

There were two important sources of the transmission of Muslim science and geography to Latin Europe and other areas in the West. The points of cultural and physical contact in Spain, Italy, Sicily, and the Aegean Islands were strengthened by intermixing of people during the prolonged period of the Crusades. Secondly, as an earlier translation activity at Baghdad had paved the way for a fruitful synthesis, so the numerous translations of Arabic works in Spain, Italy, and Sicily proved to be harbingers of scientific advance.

Latin geography before the early sixth/twelfth century was on a much lower level than the Muslim. It was too simple and childish. This remark applies especially to those writers who were not influenced by Arab ideas and continued to follow the Roman and early medieval traditions, e.g., Henry of Mayence, Guido, and Lambert of Saint Omer. On the other hand, those who showed a somewhat better geographical sense like Herman the Dalmatian, Bernard Sylvester, and William of Conches had been influenced by Arab ideas.

The major proportion of European geographical writings of sixth/twelfth century in the West consisted of Latin and other Christian pilgrim literature, though there were also a few other contributions. John of Wurzburg was a German pilgrim in the late sixth/twelfth century, Joannes Phocas was a soldier turned monk who wrote of castles and cities from Antioch to Jerusalem, and Richard the Lion-hearted was a crusader king. Sigurd, King of Norway and a crusader, made a remarkable journey to Palestine and back between 501/1107 and 505/1111. The outward journey was a fighting cruise through the North Sea, the Mediterranean, and the Aegean waters. He fought the Muslims around Spain and visited the cultured Court of Roger II of Sicily before his return home by an overland route through Europe. His saga is somewhat geographical in its content and bears traces of contact with the Orient.

Pedro Alfonso made a sketch-map of the world clearly derived from Muslim models, copying the seven climates and putting south on the top. Henry of Mayence compiled a treatise in 504/1110 which included a map. A geographic encyclopedia was prepared in 513/1119 by Guido who was probably an Italian geographer. Lambert of Saint Omer compiled another encyclopedia with maps; in this work he propounded his belief in the sphericity of the earth. Herman the Dalmatian in 538/1143 prepared his cosmographical compilation, which included astronomical and geographical information, and Bernard Sylvester produced his *De Mundi*.

Nearly all the above-named writers and their contemporaries who dealt with geographical matters were steeped in patristic and Latin traditions. But by the middle of the seventh/thirteenth century, a distinct change was perceptible, as by that time the full impact of the translations was evident in the more readily available Arab knowledge in Europe. Scholars were not only aware of it, but were beginning to feel the need of it. The new knowledge, of which Muslim geographical information and notions were an indispensable part, began to work as a great stimulus to new ideas in the Latin world.

Henceforward, the level of geographic thinking and writings was definitely raised. Vincent of Beauvais, Albert the Great, Roger Bacon, and others were all sufficiently influenced by Arab knowledge of geography and its associated fields.⁵⁵ Joannes Sacrobosco (John of Hollywood), the English astronomer and mathematician, wrote his *Sphaera Mundi* in about 631/1233. This work was slavishly based upon al-Farghani and al-Battani; it became immensely popular in the West, was translated several times, and remained in use in schools up to the eleventh/seventeenth century. William the Englishman in 629/1231 mainly interpreted al-Zarqali and al-Bittani. Vincent of Beauvais, the French Dominican scholar who died in 663/1264, compiled an encyclopedia. It was a monumental work and much of its geographical and geological information was derived from Arab sources.

Albert the Great (d. 679/1280) was another outstanding Dominican intellectual and prolific writer. He knew neither Greek nor Arabic, but acquired vast knowledge through Latin translations, seriously studied Muslim thought, and was considerably influenced by their geographical ideas. Roger Bacon's *Opus Majus* is replete with geographical references⁵⁶ to Arab sources. Gossuin of Metz or Walters' *L'image du monde*, written in about 644/1246, was derived from existing sources largely based on Muslim knowledge.

Konungs Skuggsja is an outstanding geographical and encyclopedic treatise in Old Norwegian written by an unknown author between 614/1217 and 659/1260 or about 647/1247. The author was either a priest or a Court chaplain and a good deal of his material was based upon the accounts of returned crusaders and pilgrims. It displays good geographical sense, particularly in physical geography. He believed in the sphericity of the earth. The work is not entirely without Arab influence. The travel accounts of the Englishman Sir John Mandeville, though verging on the fantastic, are a rehashing of common Arab knowledge in geography.

The fact remains that gradually most of the basic and current geographical ideas of the Muslims were passed on to the West. These were with regard to the size of the earth and its sphericity, oceans, geological processes, climate, vegetational and zoological distributions, knowledge of new lands in Africa, Far East, and Central Asia, techniques of cartography, and uses of instruments.⁵⁷ All this knowledge in various degrees of assimilation is depicted in the leading geographical works and forms the background of the so-called *mappae mundi*, and also in some of the maps of later generations preceding the Columbian era, viz., the Psalter map (c. 597/1200), Hereford map (c. 679/1280), the world map of Marino Sanuto (721/1321), the Borgia world map (c. 854/1450), Este world map⁵⁸ (c. 854/1450), Fra Mauro's Africa (864/1459), and the diagrams of *L'image du Monde* (885/1480). Though these maps were far from being real maps and mirrored more the shadows of patristic and traditional notions, yet acquaintance with Arab cartography and geographic information is revealed in them.⁵⁹

On the whole, the period from the sixth/twelfth to the ninth/fifteenth century was a period of transition and compromise, a time of absorption and fusion, because it was during this period that the conflicting Muslim and

Christian cultures were brought most closely together. The result was the creation of the core of new Europe. This was essentially Graeco-Arabic-Latin. After the invention of the art of printing in the second half of the ninth/ fifteenth century, many Graeco-Arabic scientific works were eagerly and repeatedly printed. In fact, the influence of Arab science remained paramount in Europe, till, towards the middle of the tenth/sixteenth century, Copernicus published his revolutionary concepts, and experimental science emerged. But Arab science as a factor in European thinking lingered on much longer, almost up to the eve of the Industrial Revolution.

The lesson of history is clear. In the ages following the voyages of Columbus and the intellectual ferment at the end of the Middle Ages, Europe surged forward to penetrate through the barriers of ignorance and acquired a cultural and material leadership. But Europe learnt its lessons from those who were at one time masters of the world. The Muslims were its cultural ancestors in the domain of science, geographical knowledge, discovery, and world commerce.

Chapter 63: Mathematics and Astronomy

A - Introduction

It is generally recognized that human knowledge took its organized and systematic form with the Greeks. It is equally well known that the Greeks inherited a considerable body of knowledge from their Eastern predecessors, especially the Egyptians, Babylonians, Chinese, and Indians.

The histories of science and culture, written by some Western writers, however, show a gap between the period of the Greeks and the Renaissance. They give the impression that the history of science was blank for nearly one thousand years, and scientific knowledge made a sudden leap, taking a millennium in its stride. These histories ignore the fact that the intervening ages from the first/seventh to the eighth/fourteenth century constituted the era of the Arab and other Muslim peoples.

The latest researches of Muslim and non-Muslim scholars are bringing to light the work of the Muslims in the various branches of knowledge throughout the Middle Ages. These researches are, however, scattered in various journals and books which are not easily accessible to the average educated person. Two good works of reference published are the Encyclopedia of Islam and George Sarton's Introduction to the History of Science. On a thorough study of the information available on the subject, one is struck by the magnitude as well as importance of the contributions made by the Muslims to the various branches of science, especially to mathematics and astronomy.

The magnitude of these achievements is so vast that it is giving rise to another tendency among the historians of science. It is incomprehensible to them that the Arabs who were so backward and ignorant in the centuries preceding the advent of Islam could have become so enlightened and scholarly in such a short time after adopting the new faith. One of the great exponents of this line of thought is Moritz Cantor who has written an encyclopedic history of mathematics in the German language. The chapter on the Arabs in Cantor's book begins as follows:

“That a people who for centuries together were closed to all the cultural influences from their neighbors, who themselves did not influence others during all this time, who then all of a sudden imposed their faith, their laws, and their language on other nations to an extent which has no parallel in history—all this is such an extraordinary phenomenon that it is worthwhile to investigate its causes. At the same time we can be sure that this sudden outburst of intellectual maturity could not have originated of itself.”

Laboring under this fixed idea, Cantor proceeds to attribute almost every-thing done by the Muslim scholars to the Greeks and other nations. We must confess that this kind of argument introduces an extremely dangerous principle in historical research, and can be employed only by one who is predisposed to demolish an exalted and established reputation. If Cantor had really investigat-ed the cause of the “sudden outburst of intellectual maturity” of the Arabs, he would have realized that it was primarily due to the revolution caused by Islam in the whole outlook of the people. We have elsewhere described the attitude of Islam towards knowledge.¹ By making it incumbent upon the believer to acquire

knowledge and by enjoining upon him to observe and to think for himself, Islam created an unbounded enthusiasm for acquiring knowledge amongst its followers. The result of this revolution can be best described in the words of Florian Cajori, who says in his *History of Mathematical Notation*: “The Arabs present an extraordinary spectacle in the history of civilization. Unknown, ignorant, and disunited tribes of the Arabian Peninsula, untrained in government and war, are, in the course of ten years, fused by the furnace-blast of religious enthusiasm into a powerful nation, which in one century extends its dominion from India across northern Africa to Spain. A hundred years after this grand march of conquest, we see them assume the leadership of intellectual pursuits; the Muslims become the great scholars of their time.”

It is under this stimulus of the Islamic injunction for acquiring more and more knowledge that the Arabs and other Muslim peoples turned to the learn-ing of the various branches of knowledge, preserving and improving upon the heritage left by preceding civilizations and enriching every subject to which they turned their attention. In the following pages we give an account of their contribution in the domain of mathematics and astronomy. It may be pointed out that this is only a brief chapter in the general history of Muslim philosophy. The account will, therefore, be of a descriptive nature, shorn of all technicalities and confined to some of the fundamental ideas put forward by the Muslim peoples in the fields of arithmetic, algebra, geometry, trigo-nometry, and astronomy. It is neither possible nor desirable to give here an exhaustive account of the work done by each and every Muslim scholar. We have restricted ourselves to important contributions of the prominent Muslim mathematicians and astronomers.

B - Arithmetic

The Arabs started work on arithmetic in the second/eighth century. Their first task in this field was to systematize the use of the Hindu numerals which are now permanently associated with their names. Obviously, this was an immense advance on the method of depicting numbers by the letters of the alphabet which was universal up to that time and which prevailed in Europe even during the Middle Ages. The rapid development in mathematics in the subsequent ages could not have taken place without the use of numerals, particularly zero without which all but the simplest calculations become too cumbersome and unmanageable. The zero was mentioned for the first time in the arithmetical work of al-Khwarizmi written early in the third/ninth century. The Arabs did not confine their arithmetic to integers only, but also contributed a great deal to the rational numbers consisting of fractions. This was the first extension of the domain of numbers, which, in its logical develop-ment, led to the real, complex, and hyper-complex numbers constituting a great part of modern analysis and algebra. They also developed the principle of error which is employed in solving algebraic problems arithmetically. Al-Biruni (363-432/973-1040), ibn Sina (370-428/980-1037), ibn al-Sam\$ (d. 427/1035), Muhammad ibn Husain al-Karkhi (d. 410/1019 or 420/1029), abu Said al-Sijzi (c. 340-c. 415/c. 951-c. 1024) are some of the arithmeticians who worked on the

higher theory of numbers and developed the various types of numbers, such as:

Tamm (perfect numbers), i.e., those which are equal to the sum of their divisors, e.g., $6 = 1 + 2 + 3$.

Muta`ddilan (equivalents), i.e., two numbers, the sum of the divisors of which is the same, e.g., 39 and 55: $1 + 3 + 13 = 1 + 5 + 11$.

Mutahdbban (amicable numbers), i, e., two such numbers in which the sum of the divisors of one equal the other, e.g., 220 and 284:

$$1+2+4+71+142=220$$

$$1+2+4+5+10+11+20+22+44+55+110=284.$$

(iv) Muthallathat (triangular numbers), e.g., the numbers 1, 3, 6, 10, 15, 21, 28, 36, 45, which are the sum of the first one, first two, first three, first four and so on, natural numbers.²

The Arabs also solved the famous problem of finding a square which, on the addition and subtraction of a given number, yields other squares.³

The extent of their knowledge of arithmetic can be gauged from the fact that al-Biruni was able to give the correct value of $1616-1$.⁴

C - Algebra

The ancient mathematicians, including the Greeks, considered the number to be a pure magnitude. It was only when al-Khwarizmi (d. 236/850) conceived of the number as a pure relation in the modern sense that the science of algebra could take its origin. The development of algebra is one of the greatest achievements of the Muslims, and it was cultivated so much that within two centuries of its creation it had reached considerable proportions. The symbolical process which it idealizes is still called "Algorithm" in modern mathematics. Al-Khwarizmi himself formulated and solved the algebraic equations of the first and second degree, and discovered his elegant geometrical method of finding the solution of such equations. He also recognized that the quadratic equation has two roots. Ibrahim ibn Sinn (296-335/908-946) worked on geometry, especially on conic sections. His quadrature of the parabola was much simpler than that of Archimedes, in fact the simplest ever made before the invention of the integral calculus in the eleventh/seventeenth century.⁵ Abu Kamil huja' al-Misri developed the algebra of al-Khwarizmi, and determined the real roots of quadratic equations and their interpretations. Al-Khazin (d. c. 350/961) solved the cubic equation by employing the conic sections.⁶ Abu al-Wafa' (al-Bizjani) (329-388/940-998) investigated and solved algebraic equations of the fourth degree of the type $x^4 = a$, and that of $x^4 + ax^3 = b$. Al-Kuhi (fl. c. 378/988) investigated the solvability of algebraic equations. Abu Mahmud al-Khujandi (fl. 382/992) proved that the so-called Fermat's problem for cubic powers, i.e., $x^3 + y^3 = z^3$, cannot be solved by rational numbers. Ibn al-Laith, who was a contemporary of al-Biruni, solved the problem which leads to the equation: $x^3 + 13.5x + 5 = 10x^8$, and founded geometrical methods for solving cubic equations. Al-Biruni introduced the idea of "function," which, since the time of Leibniz (eleventh/seventeenth century), has become the most important concept in modern mathematics. Abu Bakr al-Karkhi, who is considered one of the greatest Arab mathe-maticians, wrote a book on algebra, called al-Faihri, in which he developed

approximate methods of finding square-roots; the theory of indices; the theory of surds; summation of series; equation of degree $2n$; the theory of mathematical induction; and the theory of indeterminate quadratic equations.

The next important figure is ibn al-Haitham (c. 354-431/c. 965-1039), who is recognized as the greatest physicist and expert on optics of the Middle Ages, and who solved the algebraic equation of the fourth degree by the method of intersection of the hyperbola and the circle.

Then came 'Umar al-Khayyam (c. 430-517/c. 1038-1123), who has recently become the most glamorous figure of the fifth/eleventh century on account of his poetry, but who, according to Moritz Cantor, has better claim to immortality as a very great mathematician. He made what was for his time an uncommonly great progress by dealing systematically with equations of the cubic and higher orders and by classifying them into various groups according to their terms.⁷ He described thirteen different classes of cubic equations. He investigated the binomial expression for positive integral indices, i.e., in modern terminology, the expansion of $(1 + x)^n$, when n is an integer. The next significant advance on this problem was made by Newton (eleventh/seventeenth century) when he proved the binomial theorem for any rational number. As stated by Cantor, Khayyam has a very exalted place in the history of algebra.⁸

At about this time, Muslim scholars founded, developed, and perfected geometrical algebra, and could solve equations of the second, third, and fourth degree before the year 494/1100.

Moritz Cantor, who is by no means partial to the Muslims, remarks that "the Arabs of the year 494/1100 were uncommonly superior to the most learned Europeans of that time in the mathematical sciences."⁹ He goes on to relate the story that in the seventh/thirteenth century, Frederick II Hohenstaufen sent a special deputation to Mosul to ask Kamal al-Din ibn Yunus (d. 640/1242), the mathematician of a college later on called after him the Kamalic College, to solve some mathematical problems. Kamal al-Din solved these problems for the Emperor.¹⁰ One of the questions solved by him was how to construct a square equivalent to a circular segment.

D -Geometry

In the subject of geometry, the Arabs began by translating the Elements of Euclid and the Conics of Apollonius, thus preserving the work of these Greek masters for posterity. This task was satisfactorily accomplished in the early third/ninth century. Soon after this they launched on making fresh discoveries for themselves. The three brothers, Muhaammad, Ahmad and Hasan, sons of Musa bin Shakir, may be regarded as pioneers in this field. They discovered a method of trisecting an angle by the geometry of motion, thus connecting geometry with mechanics. That this problem is not solvable by means of the ruler and compass alone, has been well known from the time of the Greek mathematicians. The brothers also worked on the mensuration of the sphere and on the ellipse.

In the fourth/tenth century, abu al-Wafa', al-Kuhi, and others founded and successfully developed a branch of geometry which consists of problems leading to algebraic equations of a degree higher than the second.

Al-Kuhi solved the problems of Archimedes and Apollonius by employing this new method. Abu Kamil Shuja' al-Hasib al-Misri investigated geometrical figures of five and ten sides (pentagon and decagon) by algebraic methods. This co-ordination of geometry with algebra and the geometrical method of solving algebraic equations, like the application of geometry to algebra by Thabit bin Qurrah, a Sabian astronomer of the court of the Caliph Mu'tadid, was the anticipation of Descartes' great discovery of analytical geometry in the eleventh/seven-teenth century. Abu Said al-Sijzi "made a special study of the intersections of conic sections and circles. He replaced the old kinematical trisection of an angle by a purely geometrical solution (intersection of a circle and an equilateral hyperbola)".¹¹

Abu al-Wafa developed the method of solving geometrical problems with one opening of the compass, and of constructing a square equivalent to other squares. He made many valuable contributions to the theory of poly-hedra, which is even now considered to be a very difficult subject.¹²

Ibn al-Haitham, known in Europe as Alhazen, also made many discoveries in geometry. His famous book on optics contains the following problem, known as Alhazen's problem: from two points in the plane of a circle to draw lines meeting at a point of the circumference and making equal angles with the normal at that point. This problem leads to an equation of the fourth degree, and ibn al-Haitham solved it by the aid of a hyperbola inter-secting a circle.¹³

The later Muslim mathematicians developed the geometry of the conic sections to some extent, but their great contribution was connected with the appraisal of Euclid's postulates. It is well known that in each science or logical system (such as the Euclidean geometry), the beginning is made with some fundamental concepts (like points and lines) and a few assertions or statements, called "postulates," which are accepted without demonstration or proof, and on the basis of which further statements (called theorems) are established. Now it is recognized that some of Euclid's postulates are quite self-evident. For instance, no one questions the validity of the statement that the whole is greater than a part or that equals added to equals result in equals. But the same cannot be said about Euclid's parallel postulate. Fakhr al-Din Razi (d. 606/1209) made a preliminary critique of Euclid's postulate, but it was Nasir al-Din Tusi (d. 673/1274), who, in the latter half of the seventh/thirteenth century, recognized the weakness in Euclid's theory of the parallels. In his efforts to improve the postulate, he realized the necessity of abandoning perceptual space. It was in the thirteenth/nineteenth century that such studies, continued by Gauss, Bolyai, Lobachevsky, and Riemann, resulted in the discovery and development of the various non-Euclidean geometries, culminating in the Theory of Relativity in our own time.

E - Trigonometry

Trigonometry, both plane and spherical, was developed to a great extent by the Arabs. Al-Khwarizmi himself compiled trigonometric tables, which contained not only the sine function, as done by his predecessors, but also that of the tangent, for the first time. These tables were translated into Latin by Adelard of Bath in 520/1126.¹⁴

Al-Battani (d. 317/929), known in Europe as Albategnius, devoted a whole chapter of his book on astronomy to the subject of trigonometry. He used sines regularly “with a clear consciousness of their superiority over the Greek chords.”¹⁵ “The previous works contained only the full arc, but Al-Battani remarked that it was more advantageous to use the half arc. Cantor considers this “an advance in mathematics which cannot be appreciated highly enough.”¹⁶ Al-Battani completed the introduction of tangents and cotangents in trigono-metry, and gave a table of cotangents by degrees. He knew the relation between the sides and angles of a spherical triangle which we express by the formula:¹⁷

$$\cos a = \cos b \cos c + \sin b \sin c \cos a.$$

Abu al-Wafa's contribution to the development of trigonometry is well known. Most likely he was the first to show the generality of the sine theorem relative to the triangles. He introduced quite a new method of constructing sine tables, the value of $\sin 30'$ being correct to the eight decimal places. He knew relations equivalent to the present ones for $\sin (a \pm b)$, and to

$$2 \sin' 2 = 1 - \cos a,$$

$$\sin a = 2 \sin \cos 2.$$

He specially studied the tangent; drew up a table of tangents, introduced the secant and the cosecant in trigonometry, and knew those relations between the six trigonometric lines which are now often used to define them.¹⁸

Al-Khujandi is considered to be the discoverer of the sine theorem relative to spherical triangles. This sine theorem displaced the theorem of Menelaos¹⁹

Ibn Yunus (d. 400/1009) made considerable contributions to trigonometry, and solved many problems of spherical astronomy by means of orthogonal projections. He discovered the first of those addition-subtraction formulae which were indispensable before the invention of logarithms, namely, the equivalent of

$$\cos a \cos b = 1/2 (\cos (a - b) + \cos (a + b))$$

He also gave a formula for the approximate value of $\sin 1'$.²⁰

Kushyar ibn Labban (fl. c. 361-420/971-1029) took an important part in the elaboration of trigonometry. For example, he continued the investigations on the tangent, and compiled comprehensive tables.²¹

Al-Zarqali (fi.c.420-480/1029-1087) explained the construction of the trigonometric tables, and compiled the Toledan Tables, which were translated into Latin by Gerard of Cremona and enjoyed much popularity.²²

Al-Hasan al-Marrakushi (fl. c. 661/1262) introduced in 627/1229 the graphic method in trigonometry and prepared the tables of trigonometric functions.

Nasir al-Din Tusi wrote on plane and spherical trigonometry as a subject independent of astronomy.

Baba' al-Din (954-1032/1547-1622) gave in his book trigonometric methods for calculating heights and distances as well as for the determination of the breadth of a river.

F - Astronomy

The Arabs claimed astronomy to be their own special subject. Indeed even at the beginning of Islam, they possessed sufficient astronomical knowledge to be able to use the position of stars in their wanderings and agriculture. But it was only in the second/eighth century that the scientific study of astro-nomy was begun.²³ From this time up to the eighth-ninth/fourteenth-fifteenth century the contributions of Muslims to astronomy were so numerous that they can be dealt with adequately only in a separate volume. Here we sum-marize only some of the most important facts.

First of all let us take the observatories. Western historians have pointed out that before the advent of Islam, only one more or less well-known obser-vatory existed in Alexandria, and even that was not doing much work. In the course of a few centuries, the Muslims erected innumerable well-equipped observatories all over their vast empire. Some of these observatories are as follows:

- (i) The solar observatory built by al-Mamun in Iraq in 214/829.
- (ii) The Ispahan observatory built by abu Hanifah al-Dinawari (d. 282/895).
- (iii) The Khwarizm observatory built by al-Biruni.
- (iv) The Baghdad observatory of Thabit ibn Qurrah.
- (v) The Baghdad observatory built by Caliph al-Mustarshid, where the well-known astronomer Badi' made his observations.
- (vi) The observatory erected by ibn Sina.
- (vii) The al-Raqqah and Antakiyah (Antioch) observatories where al-Battani made observations from 264/877 to 306/918.
- (viii) The banu Musa observatory at Baghdad.
- (ix) The Sharaf al-Daulah observatory where al-Saghani and al-Kuhi made their observations.
- (x) The Tabitala observatory where abu Isbaq worked and made ob-servations.
- (xi) The Buzjan observatory associated with the name of abu al-Wafa'.
- (xii) The ibn A'lam observatory built at Baghdad in 351-352/962-963.
- (xiii) The Egyptian observatory where ibn Yunus produced his famous almanac.
- (xiv) The Mamni observatory, associated Bataihi (d. 519/1125).
- (xv) The Maraghah observatory erected by Nasir al-Din Tusi in 658/1259. It is said that several kinds of instruments were installed in this observatory, and that a library containing four hundred thousand volumes was attached to it.
- (xvi) The observatory of Taqi al-Din.
- (xvii) The Kashmir observatory.
- (xviii) The Firuzshahi observatory.
- (xix) The Samarqand observatory erected by Sultan Ulugh Beg Mirza in 823/1420.

An account of these observatories lies scattered in various books, such as: Khuldsah Tarik al-'Arab; Tamaddun-i 'Arab; Kitab al-Kitaf w-al-Athar; Sharh Chaghmani; Jami' Bahadur Khani; Mu'jam al-Buldan; Iktifa' al-

-Qunu'; Fuwat al-Wajnat; Raudat al-safa; Wafayat al-A'yan; Kashf al-Zunun.

Next to the observatories come the astronomical instruments; and the books on history record a large number of instruments constructed by the Arabs and other Muslim peoples. Work on astronomy of such magnitude could not be carried out with the rough instruments existing at the time. They had, therefore, to concentrate all their practical skill on devising elaborate instruments for making various observations. These have also been described in the books mentioned above. We shall confine ourselves to the enumeration and description of some important instruments.

(i) Libnah, built on a square base, served to measure the declination, latitude, and distances of the stars.

(ii) Halqah I'tidal (Meridian Circle), fixed in the plane of the meridian, and devised to determine the distances of the heavenly bodies.

(iii) Dhat al-Autar, constructed by Taqi al-Din, served as an alternative for the Meridian Circle which was useful during night as well as day.

(iv) Dhat al-'Alq (the Astrolabe) was one of the most important instruments. It consisted of two circles, one of which represented the ecliptic and other the celestial meridian.

(v) Dhat al-Samt w-al-Irtifa' (Alt-azimuth) consisted of a semi-circle and had the diameter of an equi-surfaced cylinder. Taqi al-Din has mentioned it in his work, to have been constructed by Muslim astronomers.

(vi) Dhat al-Shu'batain.' It had three faces on one base and served to determine the altitude of the heavenly bodies.

(vii) Dhat at-Jaib consisted of two faces and was used for the determination of the altitude.

(viii) Al-Mushabbah bi al-Natiq constructed by Taqi al-Din and used for determining the distance between two stars.

(ix) Tabaq al-Manatiq constructed by Ghiyath al-Din Jamshid and used for determining the position of the stars, their latitudes, distance from the earth, and movement. It was also useful for obtaining data relating to lunar and solar eclipses.

(x) Zarqalah constructed by Shaikh Isbaq ibn Yabya, generally known as al-Naqqash al-Andalusi (the Spanish painter). It was a very useful instrument for observing the movement of the heavenly bodies.

(xi) Dhat al-Kursi constructed by Badi' of the Astrolabe (Badi' al-Asturlabi), as described by 'Abd al-Rabman al-Sufi.

(xii) Al-Alat al-Shamilah constructed by al-Khujandi and used for determining the latitudes.

(xiii) The several types of quadrants as described in Kashf al-Zunun.

(xiv) Asturlab Sartani Mijnah, the transit instrument described by Muhammad ibn Nasr and Mansur ibn 'Ali.

(xv) Al-Jaib al-Gha'ib consisting of a semi-circle the circumference being divided equally.

(xvi) Suds-i Fakhri, a sextant associated with the name of Fakhr al-Daulah Dailami.

Now we shall describe briefly the investigations carried out by the Muslim astronomers. Although the work of regular observations and

construction of astronomical instruments was started as early as the second/eighth century by Ibrahim al-Fazari (d. c. 180/796), the most brilliant period of Muslim astronomy commenced in the early part of the third/ninth century in the observatories constructed by the Caliph al-Mamiin (198-218/813-833). The observatory of Baghdad under Yahya bin abi Mansur (d. c. 216/831) made systematic observations of the heavenly bodies and found remarkably precise results for all the fundamental elements mentioned in Ptolemy's *Almagest*, such as the obliquity of the ecliptic, the precession of the equinoxes, the length of the solar year. After recording these observations, Yahya compiled the celebrated "Tested Tables."²⁴ He was also the author of several works on astronomy.

Under the orders of al-Mamun, the Muslim astronomers carried out one of the most delicate and difficult geodetic operations, the measuring of the arc of the meridian. The mean result gave $56\frac{2}{3}$ Arab miles as the length of a degree of meridian, which is a remarkably accurate value, for the Arabic mile is 6,473 ft. This value is equal to 366,842 ft., exceeding the real length of the degree between 38° and 36° latitudes by 2,877 ft.

Habash al-Hasib was an astronomer under al-Mamun and al-Mu'tasim; he compiled three astronomical tables, including the famous "Verified Tables." Apropos of the solar eclipse of 214/829, Habash gave the first instance of a determination of time by an altitude which was generally adopted by the astronomers.²⁵

'Ali bin 'Isa al-Asturlabi was a famous maker of astronomical instruments. He took part in the degree measurement ordered by al-Mamun, and wrote one of the earliest Arabic treatises on the astrolabe.²⁶

Al-Marwarrudhi was one of those who took part in the solar observations made at Damascus in 217-218/832-833.²⁷

The three sons of Musa bin Shakir made regular observations in the observatories in Baghdad between 236/850 and 257/870.²⁸

Al-Farghani was one of the most distinguished astronomers in the service of al-Miman and his successors. His famous work, *Kitab fi Harakat al-Sama-wiyyah wa Jawani* 'Ilm al-Nujum (Book on Celestial Motions and the Complete Science of the Stars), was translated into Latin in the sixth/twelfth century. It exerted marked influence on European astronomy. He accepted Ptolemy's theory and value of the precession but was of the view that it affected not only the stars but also the planets. He determined the diameter of the earth to be 6,500 miles, and found the greatest distances and also the diameters of the planets.²⁹

Al-Mahani (d. between 261/874 and 271/884) made a series of observations of lunar and solar eclipses and planetary conjunctions during the years 239-252/ 853-866; these were later used by ibn Yunus.³⁰

Al-Nairizi (d. c. 310/922) compiled astronomical tables, made systematic observations, and wrote a book on atmospheric phenomena. He wrote a treatise on the spherical astrolabe which is very elaborate and is supposed to be the best Arabic work on the subject.³¹

Thabit ibn Qurrah published solar observations, explaining his methods. He revised the theory of the movement of the sun.³² To the eight Ptolemaic spheres, he made the addition of a ninth one (*primum mobile*) to account for

the imaginary trepidation of the equinoxes, which was, however, later found to be an erroneous theory.³³

Al-Battani was one of the greatest astronomers of the Middle Ages. He wrote many books but his main work, the famous *De Numeris stellarum et motibus*, exerted great influence in Europe up to the time of the Renaissance. From 264/877 onwards he made astronomical observations of remarkable range and accuracy. His tables contain a catalogue of fixed stars for the year 267-68/880-81. He investigated the motion of the sun's apogee and found that its longitude had increased by $16^{\circ} 47'$ since the time of Ptolemy. This implied the discovery of the motion of the solar apsides, and of the slow variation in the equation of time. He determined many astronomical coefficients with remarkable accuracy, and corrected the previous values of the precession of equinoxes and the obliquity of the ecliptic. He proved the possibility of the annular eclipses of the sun. He did not believe in the trepidation of the equinoxes, although the followers of Copernicus at a much later date did believe in it. Modern astronomy has shown that the Copernicans were wrong.³⁴ He determined the moon's nodes and discovered the wobbling motion of the earth's orbit.³⁵

Ibn Amajur (abu Qasim 'Abd Allah) together with his son abu al-Hasan 'Ali made many observations between 272/885 and 321/933 which were recorded by ibn Yunus. They produced many astronomical tables, including the table of Mars according to Persian chronology.³⁶ Abu al-Hasan discovered that the moon's distance from the sun is not constant as assumed by Ptolemy.³⁷

Al-Kuhi was the leading astronomer working in 378/988 at the Sharaf al-Daulah observatory.³⁸

'Abd al-Rahman al-Sufi (291-376/903-986) was one of the most eminent Muslim astronomers. His chief work, *Kitab al-Kawdkib al-Thabitah al-Musawwar* (Book of the Fixed Stars Illustrated), is regarded as one of the three master-pieces of Muslim observational astronomy, the other two being one by ibn Yunus and a work prepared for Ulugh Beg.³⁹

Ibn al-A'lam (d. 375/985) has been praised for the accuracy of his observations; his tables continued to be very popular for at least two centuries.⁴⁰ He determined the stellar motion by observing that the stars traverse one degree in seventy solar years.⁴¹ He also determined the latitude and longitude of many stars,⁴² and measured the greatest declination of the planet Mercury.⁴³ He found that the earth is spherical and may, therefore, be supposed to be inhabited everywhere.⁴⁴ He discovered the satellites of Jupiter, discussed the motion of the sun-spots, and determined the eccentric orbit of the comets.⁴⁵

Abu al-Wafa' al-Buzjani determined accurately the obliquity of the ecliptic in 344/955, and calculated the variation in the moon's motion. There is a difference of opinion about his discovery of the third libration in the moon's motion. Some of the older writers believed that he discovered the third libration and that Tycho Brahe rediscovered it in the tenth/sixteenth century.⁴⁶ But Sarton remarks that abu al-Wafa' did not discover this variation, but simply spoke of the second part of the evection, which is essentially different from the variation discovered by Tycho Brahe.⁴⁷

Al-Khujandi made astronomical observations, including a determination of the obliquity of ecliptic, in Rayy, in 384/994.⁴⁸

Maslamah ibn Ahmad al-Majriti (d. c. 398/1007) edited and corrected the astronomical tables of al-Khwarizmi replacing the Persian by the Arabic chronology. He wrote a treatise on the astrolabe and a commentary on Ptolemy's Planisphaerium both of which were later translated into Latin.⁴⁹

Ibn Yunus has been described by Sarton as the greatest Muslim astronomer. A well-equipped observatory in Cairo enabled him to prepare improved astronomical tables, called al-Zij al-Kabir al-Hakimi, completed in 398/1007. They describe observations of eclipses and conjunctions, old and new, and improved value of astronomical constants (obliquity of the ecliptic $23^{\circ} 35'$; longitude of the sun's apogee $86^{\circ} 10'$; solar parallax reduced from $3'$ to $2'$; precession of the equinoxes $51.2''$ per annum), and give an account of the geodetic measurements made under al-Mamun's orders.⁵⁰ He is specially noted for his method of longitude determination. As time difference is equivalent to longitude difference, the determination of local time at the same instant at two stations widely separated in longitude is sufficient. But there were no telegraphs or radio signals to give simultaneity. Ibn Yunus proposed and used a signal from the moon—the first contact of a lunar eclipse. In this way he corrected many errors in longitudes in Ptolemy's geography.⁵¹

Al-Biruni is regarded by Western historians of science as “one of the greatest scientists of all times whose critical spirit, toleration, love of truth, and intellectual courage were almost without parallel in medieval times.”⁵² He made accurate determination of latitudes and longitudes and also other geodetic measurements. He discussed in his book Qanun al-Mas'udi for the first time the question that the earth rotates around its axis. The translation of the relevant Arabic passages is as follows: “When a thing falls from a height, it does not coincide with the perpendicular line of its descent, but inclines a little, and falls making different angles. When a piece of earth separates from it and falls, it has two kinds of motions: one is the circular motion which it receives from the rotation of the earth, and the other is straight which it acquires in falling directly to the centre of the earth. If it had only the straight motion, it would have fallen to the west of its perpendicular position. But since both of them exist at one and the same time, it falls neither to the west nor in the perpendicular direction, but a little to the east.” This book of al-Biruni, viz., al-Qanun al-Mas'udi, was written in 422/1030, and gave the true explanation of the rising and setting of the heavenly bodies as being due to the rotation of the earth, thus pointing to the error in the geocentric conception of the solar system. The heliocentric doctrine was not entirely unknown to the Arabs, who knew that the earth revolved round the sun and that the orbits of the planets were elliptic.⁵³ It should be noted that Copernicus gave the scientific formulation and detailed working out of the heliocentric theory some three centuries later.

Al-Zarqali was “the best observer of his time. He invented an improved astrolabe called safihah; his description of it was translated into Latin, Hebrew, and many vernaculars. He was the first to prove explicitly the motion of the solar apogee with reference to the stars; according to his

measure-ments it amounted to 12.04” per year (the real value being 11.8”).” He edited the planetary tables called the “Toledan Tables.”⁵⁴

'Umar Khayyam was called to the new observatory of Rayy in 467/1074 by Sultan Malik Shah Jalal al-Din Saljuqi to reform the old calendar. Moritz Cantor remarks that the calendar prepared by 'Umar Khayyam, called al-Tarikh al-Jalali, was more accurate than any other proposed before or after his time. Its date was 10th Ramadan 471, i.e., 16th March 1079. The modern interpretation of Khayyam's calendar is that eight intercalary days should be introduced in thirty-three years, resulting in an error of one day in about 5,000 years. The Gregorian calendar leads to an error of one day in 3,330 years.⁵⁵

Chingiz Khan erected a magnificent observatory at Maraghah near Tabriz far surpassing any built by his predecessors. Nasir al-Din Tusi was the greatest genius of this institution. He was quite original and independent, and criticized Ptolemy quite severely, “paving the way for the overthrow of the geocentric system.”⁵⁶

Ulugh Beg, grandson of Timur, established an observatory at Samarqand, Turkestan, in 823/1420, which was best equipped. A great work produced at this observatory was an independent star catalogue, known as the “Ulugh Beg Tables,” based entirely upon new observations, the first in about sixteen hundred years, i.e., since the time of Hipparchus, second century B.C. The positions were given to the nearest minute of arc, and attained a high degree of precision for that period. Instruments used in this observatory are considered the best made up to that time.⁵⁷ It is said that his quadrant was so large that its diameter was equal to the height of the St. Sophia Church in Constantinople. This work on astronomy is regarded as one of the best books of the Muslim astronomers. It was written in 841/1437, and from it one can have a fair account of the knowledge possessed by the Muslims in the ninth/fifteenth century. The first part deals with the general principles of astronomy. The latter part contains the practical methods of calculating the lunar and solar eclipses and the construction of the tables and their applications; a list of the stars; the motion of the sun, the moon, and the planets; and the terrestrial latitudes and longitudes of the big cities of the world.⁵⁸

The Mughuls inherited their fondness for astronomy from Ulugh Beg. Farishtah remarks that Humayun was a keen astronomer and spent a good deal of time in its pursuit.⁵⁹ An observatory was founded in Delhi under the orders of Muhammad Shah in 1137/1724, which was in the charge of the well-known mathematician Mirza Khair Allah. By this time the West had made great progress in astronomy as in other branches of knowledge, and therefore a commission consisting of the ablest men of the time was sent to Europe to study the new methods followed there and new results obtained through the then latest researches. The commission brought back with it some telescopes and other instruments and a few books prepared in Europe. The King of Portugal also deputed a European astronomer to go to Delhi with the commission. But when his data were checked at the Delhi observatory, local people detected errors and made corrections in his tables and calculations of the lunar and solar eclipses. This is ascribed to the fact

that the instruments made in Europe at the time were of a smaller size than those available in the Delhi observatory.⁶⁰

The Nizamiyyah observatory was erected at Hyderabad Deccan in the thirteenth/nineteenth century, and was the biggest institution of its kind in the East. It contained a sixteen-inch refracting telescope, a transit instrument, a Meridian circle, and a good deal of other equipment essential for a modern observatory. Its unique position was recognized by international organizations, and it had an important share in the preparation of the International Catalogue of Stars. After the establishment of the Osmania University, it became a constituent unit of that University.

The influence of the Muslims in this field is traceable from the many Arabic names and words that have become an integral part of the astronomical sciences. A long list of such words can be compiled, but it would be sufficient to mention a few: almanac (al-munakh), almacantar (al-muqantarrah), nadir (nadir), zenith (samt al-ras), algol (al-ghul), altair (al-ta'ir), aldebaran (al-dabaran), fomalhaut (jam al-hut), denab (dhanab), vega (waqi'), and the various names of Muslim astronomers given to the craters of the moon.⁶¹

Chapter 64: Physics and Mineralogy

The Muslims contributed enormously to exact sciences such as mathematics, astronomy, physics, chemistry, botany, and zoology since they had succeeded in acquiring the knowledge of the sciences which had developed before the advent of Islam.

Abu Yusuf Ya'qub ibn Ishaq al-Kindi¹ was the first Muslim scientist-philosopher. His pure Arabian descent earned him the title "The Philosopher of the Arabs." Indeed, he was the first and last example of an Aristotelian student in the Eastern Caliphate who sprang from the Arabian stock. His principal work on geometrical and physiological optics based on the optics of Euclid in Theon's recension was widely used both in the East and the West until it was superseded by the greater work of ibn al-Haitham. He was the first Muslim to write in Arabic a book on music in which he designed a notation for the pitch of notes. Al-Kindi's three or four treatises on the theory of music are the earliest extant works in Arabic showing the influence of Greek writings on that subject. Of al-Kindi's writings more have survived in Latin translations than in the Arabic original.²

An observatory was opened by the three sons of Musa ibn Shakir (236-257/850-870) in their house at Baghdad. The Buwaihid Sultan Sharaf al-Daulah (372-379/982-989) instituted another in his palace at Baghdad where 'Abd al-Rahman al-Sufi (d. 376/986), Ahmad al-Saqhmani (d. 380/990), and abu al-Wafa' (d. 387/997) carried out their astronomical observations. At the Court of another Buwaihid, Rukn al-Daulah (320-366/932-976) of al-Rayy, flourished abu Ja'far al-Khazin of Khurasan who ascertained the obliquity of the ecliptic and solved a problem in Archimedes which led to the discovery of a cubic equation. Other astronomers made a systematic study of the heavens in Shiraz, Nishapur, and Samarqand.³ Banu Musa published a work on the balance.

'Utarid ibn Mubammad al-Hasib wrote a book on lapidary which is reckoned among the oldest Arabic works on this subject; abu Zakariya al-Razi quoted from 'Utarid in his famous book al-Hdwi. Al-Razi the Iranian was one of the greatest medical men of the Middle Ages. He was an expert chemist and physicist.

Al-Hakim the Fatimid was personally interested in astronomical calculations. He built on the Muqattam an observatory to which he used to ride before dawn. The intellectual lights of his Court were 'Ali ibn Ydnus (d. 400/ 1009), the greatest astronomer Egypt has ever produced, and abu 'Ali al-Haitham (Latin Alhazen), the principal Muslim physicist and student of optics. The latter was undoubtedly the foremost physicist of the Middle Ages. His researches into geometrical and physiological optics were considered to be the most important and useful up to the time of Renaissance. His explanation of the vision and functions of the eye was far in advance of the ideas of the ancients. The chief work for which he is noted is one on optics, Kitab al-Manazir, of which the original is lost but which was translated into Latin in the sixth/twelfth century. Almost all the medieval writers on optics in the West based their works on ibn Haitham's Opticae Thesaurus. In this work he opposed the theory of Euclid and Ptolemy that the eye sends out visual rays to the object of vision, and

presented experiments for testing the angles of incidence and reflection. In certain experiments he approached the theoretical discovery of magnifying lenses which were manu-factured in Italy centuries later.⁴

Ibn al-Haitham was the greatest Muslim physicist and one of the foremost opticians of the world. He found out the law of refraction in transparent bodies; laws of reflection of light; spherical and parabolic aberrations; and the law of refraction which later came to be known as Snell's Law. He discussed the magnifying power of a lens, refraction of light in the earth's atmosphere, and beginning or termination of twilight when the sun is 19° vertically below the horizon. He tried by these means to estimate the height of the homo-geneous atmosphere. He gave a better explanation of vision, though he erroneously assumed the lens of the eye to be the organ of sight. Later on ibn Rushd corrected this error and showed that sight is the function of the retina. Ibn al-Haitham explained the vision of a body by the aid of two eyes and the more magnified appearance of heavenly bodies when near the horizon than when vertically higher.

Muslim scientists evinced much interest in the determination of specific gravity of bodies. At Ghaznah in eastern Afghanistan lived abu al-Raiban Muhammad ibn Ahmad al-Biruni (363-440/973-1048), considered one of the most original and profound scientists that the medieval world produced in the domains of physical and mathematical sciences. Al-Biruni found accurately the specific gravity of eighteen different precious substances and metals. He realized that the velocity of light was enormously greater than that of sound. Al-Biruni developed the mathematical part of geography, improved mensuration, and determined quite accurately the latitude and longitude of a number of places; he devised easy methods of stereographic projection. He showed how water flows in natural springs and how it comes out in artificial wells, and explained these facts in accordance with the laws of hydrostatics. His observations led him to the conclusion that the Indus Valley was at one time a part of the sea which became solid by the deposit of alluvial soil.

The most illustrious name in Arabic medical annals after al-Razi is that of ibn Sina (Latin Avicenna) (370-428/980-1037). Al-Razi was more of a physician than ibn Sina, but ibn Sina was more of a philosopher. In this physician, philosopher, philologist, and poet, medieval Arab science culminates and is, one might say, incarnated. Ibn Sina wrote on the theory of numbers. For accurate measurement of distances he invented an apparatus involving the same principle as our modern Vernier. He made a masterly study of a number of physical subjects like motion, contact, force, vacuum, infinity, light, and heat. Ibn Sina expressed his views on all the information that could be gathered in physics philosophically. He showed that however great the velocity of light may be, it must be limited. He did valuable research in music also, but his principal subject was medicine for which he earned the title of Shaikh al-Ra'is.

Jalal al-Din Malik Shah patronized astronomical studies. He established in 467/1074 at Rayyan observatory where there was introduced into the civil calendar an important reform based on an accurate determination of the length of the tropical year. To this task of reforming the Persian calendar he

called to his new observatory the celebrated 'Umar al-khayyam. Umar al-Khayyam was born between 430/1038 and 440/1048 at Nishapur where he died in 517/1123. He is known to the world primarily as a Persian poet. Very few people realize that he was a first-class mathematician and astronomer as well. The researches of al-Khayyam and his collaborators resulted in the production of the calendar named, after his patron, al-Tarikh al-Jalali, which is even more accurate than the Gregorian calendar. As mentioned in the preceding chapter, the latter leads to an error of one day in 3,330 years whereas al-Khayyam's leads to an error of one day in about 5,000 years. 'Umar al-Khayyam performed experiments to find the specific gravity of various substances.

The attraction of iron by natural magnet was known to the Greeks; magnet's acquiring a definite direction when suspended freely was known to the Chinese. But it appears that this property was first utilized by Muslims in their marine navigation. Muhammad al-'Aufi was the first to mention it in his *Jawami'*. The directive position of the magnetic needle was known to the Chinese from a very long time, but they used it only for geomantic purposes. Most probably Muslim sailors were the first to employ it in navi-gating their ships as is evident from Chu Yu's account of sailing vessels using it between Canton and Sumatra.

Nasir al-Din Tusi's most brilliant pupil Qutb al-Din Shirazi (634-711/1236-1311) wrote *Nihayat al-Idrak fi Dirayat al-Aflak* which is largely a development of the former's *Tadhkirah*, a work on astronomical topics; it also contains valuable discussions on geometrical optics like those on the nature of vision and the formation of the rainbow. He was the first scientist to give a correct and clear explanation of the formation of a rainbow. The primary bow was explained by him to be due to two refractions and one internal reflection, and the secondary to two refractions and two internal reflections of solar rays in minute spherical drops of water suspended in the air; essentially the same explanation was given by Descartes in the eleventh/seventeenth century. The colours of the rainbow for their correct interpretation had to wait Newton's experiments on the dispersion of light.

Kamal al-Din Farisi (d. 720/1320) was a famous pupil of Qutb al-Din and under his inspiration wrote *Tangih al-Mandzir* (a commentary on ibn al-Haitham's classical work on optics, *Kitab al-Mandzir*), which was published with notes by the *Da'irat al-Ma'arif*, Hyderabad, in 1928-30.

Muslim scientists were deeply interested in Archimedes' works on mechanics and hydrostatics. In these subjects they determined the density of a number of substances. Sanad ibn 'Ali, al-Biriini, 'Umar al-Khayyam, Muzaffar al-Asfuziri⁵ and several others did some work on these branches of physics, but the most important work was done by 'Abd al-Rahman al-Khazini in his *Mizan al-Hikmah*, written in 618/1221 and considered among the master-pieces of the Middle Ages. In this work al-Khazini discussed mechanics, hydrostatics, and physics in a masterly way. He gave tables of specific gravities of liquid substances (on the lines adopted by al-Biruni) and detailed studies of the theory of gravitation (universal force directed towards the then considered centre of the universe, i.e., the centre of the earth); weight and buoyancy of air; rise of water in capillary tubes;

aerometric measurement of densities and the temperature of liquids; theory of the lever; levelling by balance; and measurement of time.

The Muslims took keen interest in clocks to find out the correct times for prayers. Their artisans acquired great mastery in this work, as may be judged from Harun al-Ras'id's presenting Charlemagne with a water-clock in 192/807.

Chapter 65: Chemistry

Alexandrian Alchemy.-With the advent of Islam, the Arab tribes, many of them still nomadic, were united into one nation. Their conflicts with the neighbouring peoples which used to end as skirmishes bringing immediate defeat on the scattered tribes, now changed into regular wars often crowning them with success. What that meant can be realized from the fact that within a hundred years of the Prophet's death, which occurred in 11/632, Islam had spread from Spain in the West to Sind in the East. As an advancing nation the Arabs came in contact with different races, and when Egypt was conquered, during the regime of the Caliph 'Umar, in 21/641, they came to know the Hellenized Egyptian culture as it then existed. Its centre was Alexandria, founded by Alexander in 332B.C.

Very soon it became an emporium of international trade attracting merchants from all over the world. Above all, the Greeks had migrated there in numbers, giving rise to a mixed culture of Egyptian and Greek origin. The Egyptians used idols in their temples and chapels, preferring those of bronze, particularly when they were gilded. The artisans of Alexandria excelled in this craft, and the manufacture of gilded bronze statues apparently became a lucrative industry.

From gilding bronze some of the artisans began to dream of making gold itself and devoted their main attention to achieve this end. Thus arose alchemy, not found before either in Egypt or in Greece. It was existing when the Arabs acquired Egypt and was one of the elements of Alexandrian culture which diffused into Arabian civilization.

There are several treatises and even books which suggest that Greek science, which flourished between 300 B. C. and 200 A. D., subsequently passed on to the Arabs who functioned as its intermediate preservers delivering it to Europeans during the Middle Ages. Such is the accepted origin of alchemy.

It now becomes necessary to offer a brief sketch of alchemy as it was founded at Alexandria. The oldest existing manuscript on alchemy is not prior to about 391/1000. But it is supposed to be a copy of a work originally written in about 100 A. D. During this early period alchemy was a semi-secret science pursued by a few obscure persons. As Taylor¹ says, "although the earlier alchemists wrote in Greek, they were not Greeks, but in all probability Egyptians or Jews. They were not Christians." And what did they call their art? This knotty problem is conspicuous by its absence in Taylor's book. When Wilson² came to review it, he supplied the missing information on "the derivation of the Greek name of the art." "The word unmistakably goes back to the craft of the foundryman and metal-worker.

First, there is the Greek verb cheo (xiw), to melt and pour, as in the casting of a bronze statue, then its derivative chump, an ingot of cast metal, and finally from this another derivative chumeia, the art of preparing metal ingots. This in time became a technical term for the artificial preparation of the precious metals, but at first, as in Zosimus, about 300 A.D., it acquired a qualifying phrase, the chumeia of silver or gold. Before the Arabic period, however, chumeia could stand alone to denote the art of transmutation.

Also before Arabic times, about 81/700 or earlier, it seems to have been confused with chemia, apparently a Greek derivative of the Egyptian word chem, meaning black. The reasons are obscure but the fact of the confusion is hardly to be questioned. Later, the Arabs took over both spellings, chumeia and chemia, prefixed their own definite article al, and handed the word on to the Europeans in about the sixth/twelfth century.” Thus kimiya is the Arabicized form of the dual word chumeia/chemia.

The Greek and Arabic Terms Compared.-Now it is even more important to know what the Arabs received under the name kimiya from the Greek-speaking alchemists-to know what the word chemeia signifies and how the Arabic word kimiya compares with it in meaning. Gildemeister³ explains that “kimiya with the Arabs primarily is not an abstraction (or the science of alchemy) but the name of a substance, of an agent, by which transmutation of metals is brought about, thus of the Philosophers' Stone, or rather of preparations made out of it. It is thus a synonym of ilcsir which likewise signifies a transforming agent. By contrast chumeia is never used by the Greeks in any other sense than transmutation of metals.”⁴

There are two synonyms in Greek, chemeia and chumeia. Gildemeister refers to the use only of the latter, apparently taking it as identical with the former. In Arabic there are two terms kimiya and iksir, the latter not being represented in Greek literature. In fact, iksir occurs far more in Arabic than the word kimiya. Iksir or al-iksir has been Europeanized into elixir which has come to mean as an agent for prolong-ing life. According to Taylor,⁵ “the alchemy of China was primarily concerned with the prolonging of life”; he adds⁶ in this connection that “it is very probable that the Arab alchemists received some information about it. It is certainly notable that the idea of the elixir as a medicine prolonging life was present amongst the Arabs and not known to their Greek-speaking predeces-sors.”

P. Kraus⁷ published a voluminous work on Jabir. Its reviewer⁸ correctly noticed that “as to the origin of all those theories, Kraus maintains that not much of Jabir's alchemy can be traced to the extant fragments of Greek alchemistic literature, and that there are certain features in his alchemistic knowledge which are definitely unknown in classical antiquity.” There has prevailed so much prejudice in favour of Greek that even the word “elixir,” absent in Greek and therefore inconceivable as a loan-word in Arabic, has been given a Greek root. Iksir has accordingly been said to have come from the Greek word ksiron, meaning dry, and has been made to connote dry powder, while elixir means essence, spirit, or fluid. How the Arabs coined their word from Greek cannot be explained. All this tends to show that the primary source of Arab alchemy lies somewhere away from Alex-andria.

The Urge to Pursue Alchemy.-There were two types of seekers after lon-gevity. First, the ascetic who was his own grocer, cook, and doctor and to whom infirmity of old age meant lingering death. The second was represented by a prince who had wealth and power and desired long life, only to enjoy his possessions fully. Though for different reasons, the Sufis, the nearest to ascetics, also indulged in alchemy. In fact, Wiedemann⁹ remarks that “the study of alchemy has had one undesirable result inasmuch

as the representatives of the mystic movement in Islam studied alchemy, e.g., ibn al-'Arabi.”

This, however, was expected, and the converse is also true, for about the master of alchemy, Jurji¹⁰ states that “later tradition makes Jabir ibn Hayyan the first Sufi.” Kraus¹¹ explains how Jabir, the alchemist, became interested in Sufism. He writes, “Alchemy is never practised by Jabir for the object of accumulating wealth and acquiring the power of gold. Its real mission is to bring about salvation.” And how was this possible? He continues to say that “Salvation in the Manichaeian sense means to oppose in all spheres of life the fatal mixture of light and darkness and to free the light from dark particles. The Manichaeian natural history, especially alchemy, aims at the great work of salvation.”

Let us now turn to the wealthy and the worldly class. According to Martin,¹² “Emperor Ts'in-She-Hwang (B. C. 220), the builder of the great wall of China, is the earliest historical sovereign who became a votary of alchemy.” There are a few more Chinese emperors who believed in alchemy; a couple of them had to pay with their lives for trying alchemical drugs. In the life of Chingiz Khan it is stated that he sent for a Taoist priest all the way from China to Central Asia, where he was encamped, to discuss if life could be prolonged for ever.

Khalid, the Umayyad Prince (40-85/660-704).-There is a sub-class among the well-to-do who would like to enjoy as sport the transmutation of a base metal into gold. Such a motive on the part of a young prince can be easily imagined and one such prince appears to have been Khalid, son of the Caliph Yazid I and grandson of Mu'awiyah. In the Arabic literature on alchemy, compiled about 377/987 by the famous bookseller al-Nadim, it is stated, as translated by Fuck,¹³ that “Khalid was the first Muslim for whom medical, astronomical, and (al)chemical writings were translated into Arabic. ...” He wrote a number of treatises and books. Al-Nadim also saw the following four of his books: (1) The Book of Amulets, (2) The Great Book of the Scroll, (3) The Small Book of the Scroll, and (4) The Book of the Testament to His Son on the Art.

Introduction of Alexandrian Alchemy.-When Khalid wanted to learn alchemy at Damascus, his capital, he sent for a teacher from Alexandria, a Christian monk named Marianos, a pupil of another alchemist, also of Alexandria, named Stephanos, who lived in the reign of the Byzantine Emperor Herkleios I (610-641 A.D.). That the best available teacher of alchemy at the time was a monk is in full harmony with what has been said of alchemy and of Sufis here. A monograph of over fifty pages has been devoted to Khalid by Professor Ruska,¹⁴ the famous German historian of alchemy.

The Oldest Alchemy and How it Reached the Muslim World.-A series of authors have established that alchemy is indigenous to China. Among the older writers may be mentioned Martin,¹⁵ while the best historical evidence has been offered by Dubs.¹⁶ From China alchemy reached Alexandria by the sea-route. In South China, the name of the dynasty that built the Great Wall is pronounced Ts'in, which became Tseen, the Arabic name for China. Likewise, the South Chinese term, kim-ya, Gold-making Juice, became the

loan-word *lcimiya*, upon which Schneider¹⁷ has published the most recent communication. It is probable that the word *kimiya*, instead of having been borrowed direct from the Chinese, was taken over from Arabic into Greek, being Hellenized there as *chemeia*. This is how it was written, but very probably its pronunciation was similar to that of *kimiya*. The pre-Islamic Arabs, bring-ing silk from South China, all along the sea-route, also imported Taoism and alchemy as the cults of immortality. To the pagan mind alchemy made a special appeal and this explains how it came to be imported. Some of the Arab alchemists of the type of what we call fakirs must have settled at Alexandria where it gradually spread mainly among monks and other ascetics. We have just seen that even centuries afterwards this character did not change for it was the monks who brought Alexandrian alchemy to Damascus.

Another way in which Chinese alchemy reached the Islamic world was via land-route. In Christianity one church tried to suppress another; and a community, speaking Syriac and calling themselves Nestorians, sought protection from outside and established an academy at Jundi-Sbapiir, in South-West Persia. The Nestorians migrated even up to China so that there must have been contact between the Nestorians of China and those of Persia. As an impact of Christianity upon Zoroastrianism there resulted the religion of Mani. The Manichaeans with their philosophy of dualism were close to the alchemists as they also believed in a similar doctrine. Briefly, Nestorian and Manichaean Persia was in intimate contact with China and was responsible for a fresh influx of Chinese alchemy. The Jundi-Shapur academy was by no means dead during the reign of Harun al-Rashid to which period Jabir also belonged. When Kraus and others notice that there was much in Jabir that was not found in Greek alchemy we have to turn to Chinese influence in Persia at that time.

The Beginning of Classical Islamic Alchemy.-The Umayyads ruling from Damascus had become very unpopular. There were plots to replace them by the 'Abbasid dynasty. Such agents were active as far east as the province of Khurasan in Persia. One such emissary was Jabir's father, Hayyan, a druggist by profession. Jabir was born at Tds, in Khurasan, about 104/722, during the family's sojourn in Persia. When Jabir was a mere boy, Hayyan was arrested for his activity and had to pay with his life. Khurasan being the border province was a centre of foreign cultures like Mahayana Buddhism and other schools of mysticism. It may be pointed out in this connection that it was again at Tus, in Khurasan, where Imam Ghazali, one of the great Muslim mystics, was born. Above all, we find in Jabir one of the first persons to be formally called a Sufi and the first among Muslims to be recognized as the master of alchemy. Both alchemy and Sufism appear to come from the same source and to have long remained together. Some of those who have written upon the history of Sufism have noticed that in its early stages it flourished only where Neo-Platonism was found. Likewise, writers on the history of alchemy have also observed its earlier co-existence with Neo-Platonism.

While Sufism and Neo-Platonism can be directly and easily connected with each other, as pertaining to the same system of thought, it requires

inquiring into what alchemy originally was in order to admit that alchemy did not develop from one craft to another, from gilding to gold-making, but was a kind of applied mysticism. The Sufis wanted immortality in the next world by spiritual exercises; the alchemists wanted it by virtue of drugs in this world. This motive at once becomes evident by a study of Chinese alchemy which represents its earliest phase. Instead of associating Islamic alchemy with Alexandrian Neo-Platonism it is more fruitful to connect it with Manichaeism and with schools of mysticism influenced by Chinese mysticism.

Khurasan, rather than Egypt, was the centre from where Islamic alchemy got its real initiation. Between Khalid ibn Yazid and Jabir bin Hayyan was a period of seventy-five years. Historically, the political power shifted from Damascus to Baghdad. At this latter centre the so-called Persian influence, but really Chinese-Manichaean doctrines, rapidly promoted Islamic alchemy. Those who compare Greek alchemy with that of Jabir notice an obvious difference between the two. If comparison is made between the doctrines and achievements of Muslim alchemists with those of China, the difference is very much less. In so far as even the alchemy of Alexandria is Chinese, though a degenerated form of it, it still has features enough for it to stand comparison with that of China.

With Jabir begins a school of alchemy much nearer to its original source, with its centre at Tus, instead of at Alexandria. The first feature to be noticed here is that the ideal seems to be not to make gold but to prepare panacean drugs. Jabir's reputation as a physician grew after the services he had rendered at the Court of Harun al-Rashid. His alchemical writings on the contrary were misunderstood even by a savant like ibn Khal-dun¹⁸ who remarked that they read like puzzles.

The effect of the chemical mysticism, which was alchemy, was demonstrated in the form of life-saving iksirs; the theory of applied mysticism was obtained from other systems of mysticism, such as Sufism and Manichaeism. The existing literature shows that alchemy proposed to make gold only and this seems to be true of Greek alchemy. The Arab alchemists, like the original Chinese masters, worked upon their preparations for making everything everlasting. When the omnipotent substance, iksir or kimiya, was applied to a base metal it became rust-proof and fire-proof, which meant it changed into gold. The same agent could also convert an ordinary stone into a permanent diamond. These features are not revealed in treatises on the history of alchemy and must be clearly pointed out.

Imam Ja'far al-Sddiq (81-148/700-765).-It will now be apparent how Jabir would venerate a master of mysticism like Imam Ja`far al-Sadiq, the sixth Imam, who lived like an internee at Baghdad. Of all the Imams he was the greatest mystic. He was deeply interested in alchemy and even composed treatises on the subject. Importance is attached to him here mainly because Jabir speaks of him as a Master and also because of the fact that alchemy and Sufism both aim at immortality. Since Jabir was both a Sufi and an alchemist, he could have received initiation from the Imam at least as a mystic. Ruska¹⁹ has edited a treatise attributed to the Imam and

discussed his position in the history of alchemy, devoting an introduction of sixty pages to the problem.

Jabir ibn Hayyan (104-200/722-815).-Our knowledge of Jabir's life is very sketchy. He was born at Tus, in Khurasan, about 104/722. He became an orphan while yet a boy and was brought up in the tribe of his father, Azd, which lived in South Arabia. Then we suddenly find him as a man of middle age active as a physician at the Court of Harun al-Rashid and as a companion of Imam Ja'far al-Sadiq. His special patrons were Harun's viziers, the Barmakids, who really introduced him to the Court. When the Barmakids fell into disfavour in 188/803, Jabir, then over eighty years old, returned to Kufah where he used to live before coming to Baghdad.

The early life of the man, say from twenty to thirty-five, must have been spent in the pursuit of alchemy probably at Tus. If he had merely been born there he would have hardly been called al-Tusi. Another designation of his, al-Sufi, also sets us inquiring as to where he acquired proficiency in this field. With Tus as a common centre for both Sufism and alchemy, the search is reduced to the minimum. When he left Baghdad immediately for Kufah, as an old bachelor, he could have hardly found people with whom he was familiar. Without relatives and surviving friends his life must have been that of a stranger and he must have migrated from Kufah to Tao where Sufism and alchemy were very much at home. According to one source, he died at Tus, in 200/815, which appears most probable, at the ripe age of ninety-three.

Two centuries after his death some houses in a part of Kufah where Jabir used to live were demolished. The house which he used to occupy was found to contain a mortar of solid gold weighing two pounds and a half which went to the royal treasury of the time. This archaeological finding gives much reality to the personality of Jabir with his many-sided features. Those who have been prejudiced in favour of Greek culture have nourished myths such as given by Thompson,²⁰ who writes that "Jabir is said to have been either a native of Mesopotamia or a Greek who afterwards embraced Muhammadanism." The fact that this theory originated from Suidas, who lived in the fifth/eleventh century, and continued to appear as late as 1351/1932, when Thompson published his book, indicates the persistence of pre-judice in favour of the Greek origin of alchemy.

The existing literature on the history of alchemy seems to be devoted mainly to textual criticism rather than to the subject proper. Hence, as late as 1353/1934 Hopkins²¹ recorded that "the fundamental work of fact-finding has been so difficult and time-consuming that no real history of alchemy has yet appeared." The same judgment continued to be repeated, when Taylor²² wrote in 1371/1951 that "it may at once be said that alchemy still remains an unsolved problem." And both these remarks apply even more forcibly to Muslim alchemy. We have not been told as yet what the Muslim alchemists were after and particularly what was meant by kimiya and iksir; whether they were identical or whether there was a subtle difference between them.

What the Europeans of the Medieval Ages got as alchemy was the system developed by the Arabs immediately before them so that observations upon the alchemy of any of these two apply to either.

“Paracelsus taught,” as worded by Thompson,²³ “that the object of alchemy was not to make gold, but to prepare medicines.” He is the founder in Europe of iatro-chemistry, but it is being maintained here that this has always been the character of alchemy and is best illustrated by the popularity Jabir enjoyed among his contemporaries. The fact that Jabir could indulge in the use of a golden mortar and yet live the life of a vegetarian, bachelor, and a Sufi-ascetic shows how he was not concerned with the making of gold as a source of wealth. The other observation is from Liebig. Chickashige²⁴ writes, in this connection, that “the long history of alchemy clearly shows, as Liebig remarked, that alchemy was never anything else than chemistry proper to its own genera-tion.” If instead of “chemistry” and “iatro-chemistry” as above we use the more familiar and precise term, pharmaceutical chemistry, then both Liebig and Paracelsus would be expressing the same idea. Here again, Jabir's career fully confirms the remarks of Parcelsus and Liebig.

Among those who spared no energy to study the writings of Jabir may be mentioned the late Dr. Holmyard. He observes that “Jabir ibn Hayyan has many claims to be considered the first to whom the title of chemist may legitimately be applied.”²⁵ Hopkins²⁶ is even more eloquent in his tribute when he states that “... if all that has been deduced from the writings of Geber (the Europeanized name of Jabir) is true, he was one of the greatest single constructive influences in science, particularly in the science of metals, that the world has ever seen. Perhaps he should be ranked with Lavoisier for instituting a great revolution in the attitude of the educated people of his time towards the study of chemistry, especially in their attitude towards experi-ments.

Whereas, since the days of Aristotle, to soil one's hands with labour has been considered, except in Egypt, despicable and proper only for slaves, it is related that Geber had some success in teaching his friends at Court that laboratory methods are necessary and the only foundation for exact and reasonable science.” Respect to practical work which Jabir must have preached is confirmed by the converse having continued to exist even after-wards. Fuck²⁷ explains that “al-Nadim had no high opinion of Alchemy or of its adepts.

Of a contemporary alchemist who was credited with having been successful, he tells us that he never found him otherwise than in straitened circumstances and dirty by reason of the chemical work he was in the habit of doing.” We can now appreciate the wealth of praise due to Jabir. Hopkins rightly showers praises upon Jabir, the Master, who infused into his people a spirit for experimentation which raised the status of Muslim alchemists so much above others that later historians, like Schneider,²⁸ could admit that “it is certain that no other people have pursued alchemy with so much per-sistent zeal as the Arabs.” The special urge on the part of the Arabs to devote to alchemy would be apparent from what follows.

Kimiya.-Man's earlier medicines came from the plant world; herbalism was then the system of medicine. From this developed the notion that herbs could even make man immortal. The Aryans idealized the soma plant, the Iranians called it homa; the Chinese believed in the mushroom chip; and the

Hebrews in the tree of life. Late in this period must be reckoned the belief in a gold-making-plant juice or kim-ya in the Hakka dialect of South China, the original of the Arabic term ki-miya.²⁹

How Kimiya worked.-The ancient religion of man was animism. Every substance, including trees and stones, was believed to have a body and a soul, and to be alive potentially. The soul was a highly refined matter, like a perfume, and it came from the sun. It was more of energy than matter, like light, which, according to some physicists, has a corpuscular nature. The soul in turn was an emanation of the cosmic positive energy, called yang, in Chinese, meaning light, while in the universe there was also negative energy, called yin, meaning darkness. Matter was frozen yin energy, and it was difficult to convert matter into energy.

Matter and spirit could form only a temporary union or mixture. But if matter received the impact of an energizing principle it was changed into reactive negative energy which would then unite with the positive energy, and the result would be a real compound or a permanent union. Even a drop of the gold-making juice was taken to be bubbling with yang energy so that if a coin of copper was heated with it its ineffective soul was expelled and the material body or copper was transformed into negative energy, and it combined with the soul or positive energy from the plant juice to make the resultant gold. Here the donor is exceptionally rich in yang energy and the ultimate transmutation of metal is due to it.

Further, the donor belongs to the plant world. In countries like China and India, with their rich flora, alchemists did depend upon fresh herbs for the transformations they wished to bring about. This being denied to an alchemist like Jabir, he exploited mainly, if not entirely, minerals and metals instead; hence the importance given to inorganic raw materials and metals in the works of Arabian alchemists. Instead of kimiya, inorganic pre-parations called iksirs were used.

Ruh.-It is necessary to describe how the minds of the alchemists worked in preparing a simple substance such as rich (soul, spirit, or essence). Every substance, they must have felt, has a soul which remains like a tenant temporarily in the substance, the container of the soul. On heating the soul can be made to leave the body; on distilling the soul can be recovered more or less concentrated in the distillate. Thus a rose gives out its soul or ruh. The flower is now a dead body and the soul is its perfume or essence. When such an essence or rult is taken as a drug it temporarily strengthens the body of the user, like blood-transfusion or an injection of glucose. The donor here gives only one of the two elements; the material body, the flower, is discarded. When the soul of the flower is introduced into the body of an-other receiver it is like the temporary transmigration of the soul which must repeat at every stage if the soul is not to disappear in space.

Iksir.-Transmigration implies that the soul and the body do not come from the same source, the two are not permanently united, the balance between the positive energy contained in the foreign soul and the potentially negative energy existing in its present container is not ideal. All that is re-quired is to convert the body into negative energy and reunite with it the soul previously separated from it. This is a regular art. For example,

take common salt. It does not sublime. Now, if re-crystallized and mixed with alcohol, just as roses were mixed with water, and the mixture distilled, the essence of common salt evaporates along with the volatile vehicle, alcohol. The distillate is added again to the residual salt in the distilling vessel and the process of rectification is continued. A stage comes when all the salt becomes fluid, leaving no solid residue. This is the iksir of common salt.

The body, the material vehicle, has by now been converted into reactive energy, negative in character, and its soul, as the positive energy, has combined with it into an inseparable whole. Salt is a mixture of a material body, or of potential negative energy, and a soul, the positive energy. Its iksir contains a permanent union or compound of positive energy coming from the soul and reactive negative energy or the transformed material body.

Technically, two processes were most necessary: distillation in the first instance, to isolate the soul, the essence, or the positive element, and calcination, to purify the material vehicle, in order to convert the potential energy into the reactive negative element. Melting of metals is a very minor operation. In the case of an active gold-making plant juice, calcining of copper is limited to gentle heating. In the case of iksir of common salt no separate calcining is necessary, repeated distillation incorporates it. It is clear by now that rids or spirit contains one element only, the positive. Iksir contains two, the positive element and the negative one. Each of them belongs to the same substance and as such must necessarily contain enough quanta of both to balance like exact opposites or rather like exact supplements.

When iksir results, the substance becomes a spirituous preparation, sublimable, volatile, atomized, or potentized. Now being all energy, it represents a permanent union, inseparable for ever. When taken as a drug it makes the patient like itself, tending to become permanent. Naturally, according to the original substance, the total energy content in different cases differs and iksirs also vary in their pharmacological properties. In any case an iksir is stronger than the spirit or rich. Whereas kimiya is a natural substance, iksir is an artificial one. To meddle with the gold-making juice in any way would be to destroy its virtues, whereas iksirs can be produced only by chemical processes, above all by distillation and calcination.

Because substances like common salt are made to distil along with alcohol, such heterogeneous mixtures as contained alcohol were probably called "elixirs" by European alchemists of the Middle Ages. It will be apparent why Jabir talked mostly, if not solely, of iksir and not of kintiya, its synonym. How iksir has been made to come from the Greek word, kseron, merely meaning dry, cannot be explained. By constitution iksir was taken to be the purified body with its soul returned to it. It was a revived body and a returned soul, where the two, on becoming identical, represented a third substance.

The picture was essentially the same as that of man after resurrection. The soul would return to the dead body which would revive and henceforward remain immortal. But the revived person would be a regular mutation, his body feeling neither thirst nor hunger. He would be like a

spirit or ghost with a body no longer composed of matter. Iksir represents such a substance, material to look at but in fact become energy, and, what is important, also a donor of energy.

Whatever the substance iksir may have been, its uses mainly decide its virtues. Jabir prepared iksirs from one substance after another and as an indefatigable worker could not avoid studying the properties of inorganic acids into which he tried to dissolve his metals to purify them, instead of melting them alone or along with other metals. In India the metals were never purified by the use of inorganic acids but mainly by calcining them with boiled extracts of herbs. In order to have substitute a plant extracts or organic acids Jabir prepared inorganic acids not for their own sake but for making iksirs. His experiments spread over a wide range of substances. The preparations resulting from them must have maintained Jabir's enthusiasm and made him a master. Holmyard,³⁰ a chemist and an author of standard text-books on chemistry, after a careful study of Jabir, rightly states that "like painting which reached its highest pitch of perfection while still in its infancy, Islamic alchemy never surpassed the level it attained with one of its exponents, Jabir ibn Hayyan." We can represent him as a noble soul, seeing diseases all over, finding no herbs to treat them with, and so taking with a vengeance to minerals as the only source of supplying remedies. Enthusiasm born under such circumstances, incorporating the personality of the worker and the poverty of the country reacting upon it, resulted in the achievement with which the world today remembers the name of Jabir.

Those who do not know what iksirs mean, certainly not mere powders, cannot imagine the deep urge for or high aim in making them. At every stage we have to remember that Jabir was an ascetic-bachelor and a mystic-Sufi; acquisition of wealth or making of bullion gold could never have been his motive. In the absence of the right perspective much energy has been wasted in trying to separate historical data from Jabirian legends. What is still required is to isolate alchemy proper from Jabir's writings. Writers on alchemy, rather on Alexandrian alchemy, have rightly attached full importance to the early record of the word *chemeia*.

Likewise, in dealing with the history of Muslim contribution to alchemy we feel that the introduction of the word iksir played an even more significant role. Jabir apparently used it for the first time and demonstrated its claims. Paracelsus is credited with having founded iatro-chemistry or having taught that the real aim of alchemy was to prepare medicines and not to make gold. Jabir would have been surprised to hear that alchemy was anything but that, and his iksirs anything but highly potent, we may say, omnipotent and multipurpose drugs. Kraus³¹ has translated from Arabic into German a text revealing what iksir can prove to be; an extract from it has also been rendered into English by Holmyard.³² Harun al-Rashid's ministers belonged to the Barmakid family.

One of them, Yahya, was much devoted to a lady in his harem. She fell ill. The case ultimately became so hopeless that Jabir was sent for. The report" as coming from Jabir himself maintains: "I had a certain elixir with me, so I gave her a draught of two grains of it in three ounces of vinegar and honey and in less than half an hour she was as well as ever. And Yahya fell

at my feet and kissed them, but I said, 'Do not do so, O my brother!' And he asked about the uses of the elixir and I gave him the remainder of it and explained how it was employed, whereupon he applied himself to the study of science and persevered in it until he knew many things." Having demonstrated such a dramatic achievement it is impossible for any sane person to have found interest in making gold instead. Jibir's alchemy consisted only in preparing iksirs or wonder-drugs which were more precious than gold.

The Philosophers' Stone (Hajr Mukarram).-The preparation which marks the zenith of alchemical achievement is the Benevolent Stone (hair mukar. rang). The alchemists called themselves philosophers or Ilakima as opposed to physicians or, tabibs. The Alchemists' Stone was correctly paraphrased as the Philosophers' Stone. This is the genesis of the term. In the historical survey of the chemical arts of China by Li,³³ we read that "Chin-tan, an alchemical term in Chinese, first appearing in Pao-p'u tzu (a work composed about 317-332 A. D.), comes to refer to a drug or elixir which was prepared by the alchemists for prolonging life and transmuting metals. It reminds us of the Philosophers' Stone because this was considered to have the same effect as Chin-tan.... The language of the ancient alchemists is very hard to understand [a confession recalling the judgment of ibn Khaldun upon Jabir]. It is supposed that Chin-tan may have consisted of mercury, sulphur, lead, etc., a compound or mixture prepared in accordance with a theory not unlike that of Jabir, who supposed that every metal contained mercury and sulphur." The admission seems to be to the effect that the theory, that metals are composed of mercury and sulphur, did exist in China but in a vague form.

Taking the simpler notion first, with Jabir all metals including gold were composed of mercury and sulphur. Davis³⁴ states that, "for the Chinese alchemists, positive yang was lead instead of sulphur; negative yin was mercury." Jabir died in about 184/800. The Chinese alchemist, Chang Potuan,³⁵ living later in 373-475/983-1082, still maintained the ancient Chinese theory that "our fellow workers must be able to recognize true lead and mercury." It is, therefore, clear that Jabir borrowed a theory as known to the Chinese but improved upon it, keeping mercury as the one element and changing the other from lead to sulphur.

The surprising feature of the Sulphur/Mercury theory about the origin of metals is that it has not been challenged by experimenters who have melted metals, calcined them, and even sublimated at least arsenic and mercury compounds. That they should have believed that iron consisted of sulphur and mercury, and that even gold consisted of the same elements, has received no explanation so far. The primitive man accepted blood as the life-giving principle and further believed that its red pigment was the real agent. Thus redness was taken to be the active principle so that any red substance could generate blood. Of all red substances cinnabar was the nearest approach to blood in colour.

When it was established by actual synthesis that cinnabar consists of mercury and sulphur, its elements came to be considered to be the elements of all metals. Animism assumed that even metals were living things, having

a soul as well as a body. When negative energy freezes it becomes matter and the body of the metal consists of it. The soul is represented by the positive element, one which is sublimable so that it can permeate the material body. Lead is not volatile, sulphur is; hence the Lead/Mercury theory was essentially defective and the justification of the Sulphur/Mercury modification.

Further, lead and mercury do not produce a red compound, while sulphur and mercury do. But if Jabir's theory is a modification of a previous Chinese theory, how is it that in its original form it accepted lead and mercury as the elements of metals? What was required as the end-product was redness, and theorizing depended upon this result. Lead heated by itself oxidizes in the air to red lead or minium. Likewise, mercuric oxide is obtained as red, orange, or yellow powder, consisting of minute crystals. Thus, the Chinese theory was, indeed, properly conceived, but it failed to include a spirituous element like sulphur, while lead obviously was not.

Alchemy as a philosophical system is based on a dualism, postulating that everything consists of two elements, of light (yang in Chinese) and darkness (yin). When the metals were ascribed their constitution, sulphur and mercury came to be taken respectively as positive (yang) and negative (yin) elements. And the realistic basis of this theory, as has been explained, came from the actual knowledge of what constituted cinnabar and the identification of cinnabar with blood. When the cosmic forces, yang and yin, are in perfect balance, it means yin exists as a negative creative energy and not as frozen matter, while yang naturally always remains spirituous; the result of their union is like that of two substances, identical in nature but oppositely charged, like positive and negative electricity.

The resultant is everlasting. Pure sulphur and pure mercury are imagined to be existing as energy, even though they may not appear to be so, and their resultant, when ideal or when the two are perfectly balanced, means an everlasting union, which is gold. According to another tenet of animism, like makes like; gold, the everlasting metal, as a drug makes the consumer also immortal. Gold remaining in mines for millions of years loses this property of donation, its negative element, mercury, having become less spirituous or more material; hence gold, as a drug, must be freshly pre-pared.

Better still it must be in a stage prior to its becoming gold, so to say, in a nascent stage when it is the iksir of gold, a ferment-like substance which will convert any metal into gold. This is the Philosophers' Stone, converting matter into energy, energizing the material or the negative element until it comes to the same level as its positive or spirituous element.

We, thus, see that rich or spirit consists of only the positive element, the soul; and iksir consists of two elements, the positive element and the purified material element sublimated into reactive negative energy. Philosophers' Stone is double iksir; it consists of sulphur as a substance, which has a body and a soul (or failing sulphur, its substitute, say lead), and mercury as a substance, likewise with two elements of its own, its body and soul. In all, there are two purified bodies and two souls returned to their respective bodies.

The question now arises that if there are four elements compounded to form a fifth substance, why not another which is double that of the Philo-sophers' Stone. There are only four cosmic elements-heat, cold, dryness, and humidity. The body and soul of sulphur and the body and soul of mercury represent all these four cosmic elements; hence, between themselves, mercury and sulphur fully represent the cosmic force, the highest imaginable.

We have seen that Islamic alchemy was almost non-existent at Damascus. Baghdad produced its first two masters without whom there would perhaps have been no alchemy in the Islamic world. If alchemy at Damascus meant an importation from Alexandria, alchemy at Baghdad was an importation from Khurasan, which in turn was really an importation from China. Now two sub-stances used by Jabir reveal the alchemy which he borrowed and upon which he improved. Ammonium chloride has played a very important role in al-chemical preparations to which Stapleton³⁶ devotes a special monograph.

From Holmyard³⁷ we learn that Jabir's "is one of the earliest Arabic mentions of sal-ammoniac which for a time was imported from inner Asia. Jabir, how-ever, knew how to prepare it from organic matter." Inner Asia is a vague term which makes it difficult for the reader to locate the actual source of the product. However, Stapleton³⁸ explains that the Arabic word, nushadar, for sal-ammoniac, is a loan word-from Chinese. The origin of the product is thereby assured.

Another substance Jabir used is what he named khar sini. Holmyard³⁹ comments, "Muslim writers say that it was used in China to make mirrors. According to Laufer, it was an alloy composed of copper, zinc, and nickel, known as pai-t'ung in Chinese, or white-copper." Khar is salt and a loan-word in Arabic. It cannot be made to express any metal or alloy. An alloy compar-able with pai-t'ung is called bidri in India, consisting of copper, lead, and zinc in the ratios of 1:1:16. To give it a dark surface, sodium sulphate is used. A similar salt may be used for giving a metallic white surface to a different alloy of copper and zinc. In fact, it is easier to give it a metallic shine than to make it dull black. This salt of Chinese origin further points to the source of Jabir's alchemy.

Jabir being a mystic incorporates numerology into his alchemy, a fact discussed by some writers, above all by Stapleton⁴⁰ According to him, the square with the nine cells was found as a motif near Nineveh as early as 4000 B.C. But in China also from at least the seventh century B.C., if not actually from the eleventh century B.C., the nine rooms of the square of the Imperial Temple had assigned to them the first nine numbers arranged in the actual order of these numbers in the simplest Magic Square. Even Jabir's numerology can thus be safely classed as Chinese in origin.

The Emerald Table of Hermes.-Among Jabir's writings, Holmyard first discovered in 1342/1923 the Arabic original of the famous Latin work bearing the above name. It deals with the phenomenon of change in nature, a typical Taoist idea, couched in phrases like those used in the following quotation from it: "That which is above is like that which is below and that

which is below is like that which is above.” Such mystical statements are more deco-rative than illustrative in any other context.

Turba Philosophorum.-A Latin work of this title was very popular with European alchemists. It contained many names which were cited by Jabir in one of his books. On that account Ruska, in 1352/1933, proved that there should be an Arabic original of the Turba and this was confirmed by Stapleton by indicating that a fourth/tenth-century authority, ibn 'Umail (see later) quoted passages from it. Plessner having studied the problem exhaustively says, as quoted by Holmyard,⁴¹ that “it is the three-fold result of the cosmo-logical discussion, the Qur'anic Creator-God, the unified world, the four elements (heat, cold, dryness, and humidity) that gives the discussion its clear direction towards the chief subject of the Turba, alchemy.” From the contents of the two classical works of medieval alchemy, the Turba and the Emerald Table, incorporated in Jabir's writings, the reputation he enjoyed in the Middle Ages can be easily visualized.

Al-Razi (c. 251-313/865-925).-Engaged as he was in preparing elixirs, Jabir was called upon as a consultant to use them when ordinary drugs had proved ineffective. On the contrary, abu Bakr Muhammad ibn Zakariya al-Razi, an account of whose philosophy has been given in Volume I (Chapter XXII) of the present work, was a physician by profession. At the age of thirty he went to Baghdad, where the achievements of Jabir must have been narrated almost as miracles. Al-Razi could not but have been inspired by the tradition existing at Baghdad in favour of Jabir's elixirs. At Baghdad he decided to become a physician. As a Muslim alchemist he comes next only to Jabir. His fame in the medical world became so high that he was consulted when a hospital at Baghdad was being extended and ultimately became its chief physician.

Holmyard unwittingly remarks that “like the majority of physicians of medieval times, Razi was led to the study of alchemy.” In fact, alchemy has been nothing else but pharmaceutical chemistry and the physicians of those times had to prepare their own medicines. When Razi decided to become a physician he was probably attracted by the reports about elixirs. In other words, he became an alchemist first and a physician afterwards. Among his writings only one book dealing with alchemy has reached us. It is entitled “The Book of the Secret of Secrets” translated into German by Ruska.⁴² “Stapleton,” says Holmyard⁴³ “places Razi on an intellectual level with Gallileo and Boyle.” There is an illuminating article on al-Razi and alchemy by Heym,⁴⁴ where we read⁴⁵ that “bodies are composed of invisible elements and of empty space that lay between them. These atoms were eternal and possessed a certain size.” The statement reminds us of the modern explanation of the structure of crystals.

Razi accepted Jabir's Sulphur-Mercury theory of the constitution of metals but Heym says that “in the same way the attribute of salinity enters into Razi's scheme.” He comments at the same time that “without doubt it is here [with Razi] that the origin of the popular conceptions of alchemy with its three elements-mercury, salt, and sulphur-can be found which reappears later in Europe and plays such an important part in the history of Western alchemy.” Without mentioning Razi's name, Thompson⁴⁶ writes,

“This Sulphur-Mercury doctrine was accepted by most alchemists until about the twelfth century, when the theory was extended by the addition of a third elementary principle, to which the name “salt” was given.

It was believed to be a basic principle which gave solidity and resistance to fire. Mercury was considered to be the connecting link between the spirit and the body, and the element on which depended blood and life.” The source of the Sulphur-Mercury-Salt theory not mentioned in Thompson is revealed by Redgrove,⁴⁷ who writes that “Isaac Hollandus appears to be the earliest known writer who makes mention (c. 1063/1652) of the famous Sulphur-Mercury-Salt theory.”

Thompson places the theory in the twelfth century; Redgrove, makes it seventeenth century; while Razi, the real author of it, lived in the third/ninth century. An explanation can also be offered as to how an alchemist of Holland came to be credited as the pro-pounder of this modified theory. Heym writes that “in Europe throughout the Middle Ages until the seventeenth century, Razi's works on medicine were still part of the curriculum at Dutch Universities.”

It has been casually indicated that alchemy as a system of thought is based on dualism which characterizes Manichaeism and which was at its best in China. At any rate, al-Razi was so much influenced by dualism that Heym says, “al-Razi was also called a Manichaeon,” though he gives a different explanation for this appellation of his. Where Razi continued the tradition of Jabir, which rightly made an appeal to the judgment of Hopkins, was his love for practical work. Heym states that “even though al-Razi in his alchemy was not strictly empirical in our sense of the word, his great work mentioned above is a book of experiments; it is a book of practical alchemy.... There it can be said that al-Razi is the creator of a new alchemy for he seems to be the first to have transformed theoretical alchemy into a new strictly scientific system. Or, to be more definite, al-Razi transformed alchemy for the first time into a new and strictly scientific system.” To a practising physician and to one who was not a mystic like Jabir, it was practical phase of alchemy, which was inorganic pharmaceutical chemistry of the age that naturally appealed most.

Ibn Sinn (370-428/980-1037.)-Europeans in the Middle Ages had Latinized the names Jabir into Geber and Razi into Rhasis or Rhazes, and these easily passed on as those of their own masters in science and medicine. The greatest medical authority of the Muslim world was abu 'Ali Sina whose name was likewise adapted as Avicenna. Muslim physicians call him the Shaikh, meaning the Prince of Physicians. His career shows nothing revolutionary like that of Razi. He studied medicine in the routine way and became proficient enough to treat patients even by the age of sixteen. Being a genius he was called by one prince after another from Bukhara to Iran and served them even as a vizier. Enjoying Court life in every sense of the word, luxury above all, he could have hardly found time to experiment as a pharmacist. In his classic entitled the “Canon of Medicine,” some seven hundred and fifty drugs are mentioned, but they are all simples or individual drugs, vegetable, animal, and mineral in origin. None of them are of the class of high potency or synthetic inorganic chemicals, or iksirs. In his

writings alchemy is discussed but critically. As a physician he did not use any iksir; it is out of question that he could have believed in a substance changing base metals into gold.

Ibn 'Umail (250-300/864-912).-In a short contribution on the subject such as this we have to be strict in selecting the representatives of Islamic alchemy. In doing so we have dealt with authors whose works were translated into Latin during the Middle Ages. These are, so to say, the masters who served as progenitors of European alchemy. Now, Davis⁴⁸ has tried to prove by the common contents and even the common illustrations of the works on the subject that the alchemy of medieval Europe is almost identical with that of China. To connect European alchemy with that of the Chinese, it becomes necessary to place Islamic alchemy as the real connecting link between the two. It would at once explain a continuity of thought and give a complete sketch of the evolution of alchemy. As depicted at present, there seem to be at least two different systems of alchemy isolated and unconnected. For this reason we wish to mention one more author whose work was translated into Latin and printed in 1032/1622. He is Ibn 'Umail. Stapleton⁴⁹ and his colleagues have edited 'Umail's three Arabic texts and also the Latin translation in 1032/1622, along with copious notes which together make the presentation a model of scholarship. When we compare 'Umail's treatise with an original European work on alchemy, *Splendor Solis*, a classic in itself, by Solomon Trismosin,⁵⁰ composed about 990/1582, we get the impression that the contents and even the style of presentation are the same in both the works. The influence of alchemical literature in Arabic on medieval European writers becomes thereby quite evident.

Our present contribution will serve its purpose better if we indulge in offering in modern phraseology what these alchemists were actually after. It is a problem of science to explain how one form of energy is converted into another, e.g., heat into light. Likewise, a far greater problem, but of the same category, is to explain how matter changes into energy and vice versa. Ibn 'Umail, like a typical alchemist, expresses this as follows: "Turn bodies into non-bodies and non-bodies into bodies." Iksir was the energizing principle which could sublimate matter into energy. This was with regard to technique only. The aim was to energize the human body to make it immortal. When the soul is strengthened and the body merely reconditioned and not thoroughly purified, life is only prolonged. The agent that purifies the human body can purify the body of a base metal as well. With a purified body man mutates into an immortal being capable of flying about in the air, as Davis⁵¹ has clearly emphasized. With the purified body a base metal mutates into an everlasting form which is gold. Alchemical improvement ended in the permanency of form. Thus, the active agent behaved in one and the same way, converting impure body into sublime energy, resulting in man's immortality and in the synthesis of gold. This is what Ibn 'Umail actually meant.

Jildaki (d. 762/1360).-The last authority we propose mentioning here is Jildaki. One of his works, "End of Search," has been the subject of detailed study by Dr. M. Taslimi of Teheran—a study which was accepted as a thesis

for Doctorate by London University in 1954. Unfortunately, the thesis has not yet been published. But Holmyard⁵² summarizes it by saying, “That there is a great deal of similarity between the ideas contained in the quotations of Jabir given in the 'End of Search' and those found in the Latin works of Geber but the correspondence is not sufficiently close to establish a definite affiliation.” Our problem has been to find how, from author to author, alchemy has actually progressed. After al-Razi or at the most after 'Umail we find repetition of what had been said before in different words and with other illustrations. No wonder that Holmyard justly observes that “after Jildaki there is no outstanding figure in Muslim alchemy.”

Alchemy in Other Islamic Countries.-No writer to our knowledge has spoken of alchemy by Muslims outside the schools of Damascus and Baghdad. What about the impact of local schools of alchemy upon Muslims living in India, Burma, Indonesia, and elsewhere? Dr. Maung Htin Aung,⁵³ Vice-Chancellor of Rangoon University, speaks as follows: “Some members (of the Burmese Science) association may (be) also (among those who) consider the Burmese alchemist to be a charlatan and an impostor. But I will plead with you to spare him a sigh. Of all the religious cults that existed in Burma before the advent of Buddhism, alchemy was the noblest. Like modern science, Burmese alchemy aimed at the conquest of nature, and discovering for suffering humanity a way to preserve the human body in its vigour and beauty.” Jabrian alchemy was certainly that and it is impossible to think that any two systems in- corporating such ideas did not fuse.

Chapter 66: Natural History

A

Inasmuch as the sciences studied in any traditional civilization, that is, one based upon a divine revelation, depend upon the metaphysical and religious bases of that civilization, Muslim sciences have always echoed and reflected the central Islamic doctrine of unity (tauhid). Just as the Islamic religious and moral sciences have begun from and returned to the idea of divine unity, the natural sciences have tried to discover the interrelation of all created beings. It is a general feature of all medieval cosmological sciences¹ that they seek to express the “unicity of all that exists.” Especially in the Muslim natural sciences this goal has been central, and the idea of the unicity of nature and the interrelatedness of all parts of the universe has remained as a complement to and necessary consequence of the oneness of the Creator.

Since the most legitimate and meaningful way of studying a science is with respect to its ultimate aim and from the point of view of those who have cultivated it, we shall best understand the Muslim sciences if we keep in mind that their primary aim, unlike that of the modern natural sciences which are only analytical and quantitative, has been to arrive at the unity lying behind the veil of multiplicity of natural forms by a synthetic and qualitative study of nature.²

This search for unity is clearly manifested in a general science like natural history. As studied by the Muslims, natural history covers a large number of fields and includes not only such subjects as geology, botany, zoology, and anthropology, but also cosmogony and sacred history³ Natural history means essentially the history of nature in the vastest sense of the word, and because Muslims have never separated the spiritual and the mundane, they have usually written natural history within the context of sacred history as is seen so clearly in the universal histories like those of Tabari and Mas'udi. The many allusions in the Qur'an to natural phenomena and the fact that the verses of the sacred book as well as the phenomena of nature are called ayat (signs) signify that in the Islamic perspective there is a fundamental affinity between the divine and natural orders and indicate, therefore, the legitimacy of connecting sacred history with natural history.

The question of the “signs” of nature leads to another basic feature of Muslim natural history. Most Muslim scientists have sought to study nature in order to observe “signs” of the Creator in it, to witness directly the “vestiges” of God in His handiwork.⁴ This is a feature which seems most irritating to some modern scientists who aim to discover only the immediate and the material causes of things. But from the point of view of Islam, no science can be considered legitimate which does not ultimately consider things in reference to their divine origin and which does not take into account the transcendent cause of all finite beings. The marvels and wonders of nature and the moral and spiritual lessons drawn from plant and animal life mentioned by the Muslim natural historians, which many modern historians have ridiculed, have been from the point of view of Islam itself the most beneficial and basic elements of natural history because they have led the reader to a recognition of the divine agent present in nature.

The Islamic perspective is in a way very practical. The sciences which this perspective has nourished and matured are all in a sense useful, that is, they correspond to a basic need of man as envisaged in Islam. They may, like agriculture, medicine, and the sciences of history and society, be useful in the limited sense and fulfil man's physical and social needs. Or, like logic and theology, they may be useful in preventing people from being misled by false reasoning. Or, finally, like the esoteric doctrines of Sufism, they may be useful in quenching the thirst for spiritual realization of the few, who seek God here and now. But Islam has never considered simple curiosity or intellectual pas-sion either a virtue or a basic need of man and for this reason has never legitimized a science based only on curiosity.⁵ The desire of natural historians to learn moral and spiritual lessons from the phenomena of nature is, there-fore, legitimate from the point of view of Islam because it is spiritually meaningful and fulfils a need, whereas finding the weight of a certain leaf of a tree to be so many grams is from this point of view a secondary and un-important inquiry unless it leads to higher knowledge. The modern criticism of Muslim natural historians on this point is, therefore, unjust and based on a misapprehension of their point of view.

There is yet another aspect of Muslim natural history which is difficult to understand from the modern point of view. It is the description of strange animals and plants and magical properties of nature which the medieval authors seem to have recorded so credulously. One finds similar accounts in ancient books like Pliny's *Historia Naturalia*. The creatures described in these texts, which appear strange today, are of several types. One type is of strange animals, especially sea animals, which could certainly have existed but later became very rare or extinct and the description of which, therefore, seems fantastic now for they can no longer be observed. Another type is of animals and plants like the dragon, unicorn, and mandarine, which originally had symbolic meaning only, but the symbolism of which in certain cases was so forgotten that they came to be erroneously described as living creatures.⁶

As to the apparent frequency of "strange" phenomena within nature and the innocence with which medieval authors recorded them, it must be noted that the minds of those people were not as "hardened" as those of the moderns, and that nature in turn then was not taken to be so "dense" and "coagulated" and far separated from its psychic aspect as now.⁷ Therefore, while reading ancient and medieval texts it should be kept in mind that just as the people of those ages, like the people of certain parts of Asia, Africa, and America today, regarded nature from a point of view different from that of modern science, nature also revealed an aspect of itself to them different from that which it reveals to those moderns whose mental constitution is no longer capable of receiving nature's more subtle elements. There is, of course, much misinformation due to narrative and exaggerated style characteristic of the poetic mind of many Muslims. But on the whole most of the contents of Muslim natural history can be understood in terms either of direct observation of physical realities or of symbolism, i. e., the description of the subtle aspects of nature the reality of which is not in any

way affected because the modern quantitative sciences refuse to consider it from their own peculiar point of view.

B

Types of writings which contain material on natural history, particularly on plants and animals that form the centre of our interest in this chapter, are quite diverse. Muslim authors have rarely had a taste for over-specialization so that one finds a discussion of the plant and the animal kingdoms not only in scientific texts but also in literary, historical, philosophical, and theological works. More specially, the sources for natural history include the writings of historians, geographers and travellers, physicians, alchemists, philosophers, encyclopedists, cosmographers, moralists, theologians, and Sufis, and, of course, authors writing specifically on the subject of natural history.

The *Tarikh al- Reful w-al-Muluk*, the universal history of Tabari, the *Kitab al-Buldan*, the book of countries of Ya`qubi, the *Kitab al-Bad' w-al-Tarikh* of Maqdisi, the *Muruj al-Dhahab* and *Kitab al-Tanbih w-al-ishraf* of Mas`udi, the *Tarikh-i Jahan-gusha* of Juwaini, and the geography of abu 'Abd Allah ibn al-Idrisi, all dealing with history and geography, contain valuable sections on natural history. Moreover, they provide, on the one hand, the perspective of time in the light of which Muslims have viewed the life of all creatures, a time stretching between the creation and the final annihilation of the universe on the Last Day, and, on the other, they mention the geographical setting, the seven climates, and other terrestrial conditions which form the matrix of natural history.⁸ They demonstrate, further, how closely the study of plants and animals is bound up with that of the other parts of the universe, both terrestrial and celestial,⁹ and how the history of nature is intrinsically related with the history of man as well as with sacred history.

Another source for the knowledge of natural history comes from the many books of travel which survive from that period of Islamic history when the Muslim world was still more or less united and travelling from one place to another was easy. The accounts of the travels of abu al-Hasan al-Maghribi, ibn Jubair, Biruni, Nasir Khusrau, and ibn Battutah, to mention a few names, provide a wealth of information on plants and animals which these men observed themselves or the accounts of which they heard from others. The interpretation which they gave to their observations varied greatly, depending on their knowledge and experience as travellers. One often finds simple description as in the case of Maghribi, or detailed physical observation and inference based upon it as in the case of Biruni, or philosophical and metaphysical reflection upon natural forms as is found in the writings of Nasir Khusrau.
